Gichtel, Johann Georg (1638-1710), German mystic, was born at Regensburg, where his father was a member of senate, on the 14th of March 1638. Having acquired at school an acquaintance with Greek, Hebrew, Syriac and even Arabic, he proceeded to Strassburg to study theology; but finding the theological prelections of J. S. Schmidt and P. J. Spener distasteful, he entered the faculty of law. He was admitted an advocate, first at Spires, and then at Regensburg; but having become acquainted with the baron Justinianus von Weltz (1621-1668), a Hungarian nobleman who cherished schemes for the reunion of Christendom and the conversion of the world, and having himself become acquainted with another world in dreams and visions, he abandoned all interest in his profession, and became an energetic promoter of the "Christliche Jesusgesellschaft," or Christian Edification Society of Jesus. The movement in its beginnings provoked at least no active hostility; but when Gichtel began to attack the teaching of the Lutheran clergy and church, especially upon the fundamental doctrine of justification by faith, he exposed himself to a prosecution which resulted in sentence of banishment and confiscation (1665). After many months of wandering and occasionally romantic adventure, he reached Holland in January 1667, and settled at Zwolle, where he co-operated with Friedrich Breckling (1629-1711), who shared his views and aspirations. Having become involved in the troubles of this friend, Gichtel, after a period of imprisonment, was banished for a term of years from Zwolle, but finally in 1668 found a home in Amsterdam, where he made the acquaintance of Antoinette Bourignon (1616-1680), and in a state of poverty (which, however, never became destitution) lived out his strange life of visions and day-dreams, of prophecy and prayer. He became an ardent disciple of Jakob Boehme, whose works he published in 1682 (Amsterdam, 2 vols.); but before the time of his death, on the 21st of January 1710, he had attracted to himself a small band of followers known as Gichtelians or Brethren of the Angels, who propagated certain views at which he had arrived independently of Boehme. Seeking ever to hear the authoritative voice of God within them, and endeavouring to attain to a life altogether free from carnal desires, like that of "the angels in heaven, who neither marry nor are given in marriage," they claimed to exercise a priesthood "after the order of Melchizedek," appeasing the wrath of God, and ransomning the souls of the lost by sufferings endured vicariously after the example of Christ. While, however, Boehme "desired to remain a faithful son of the Church," the Gichtelians became Separatists (cf. J. A. Dorner, History of Protestant Theology, ii. p. 185).

Gichtel's correspondence was published without his knowledge by Gottfried Arnold, a disciple, in 1701 (4 vols.), and again in 1708 (3 vols.). It has been frequently reprinted under the title Theosophia practica. The seventh volume of the Berlin edition (1768) contains a notice of Gichtel's life. See also G. C. A. von Harless, Jakob Böhme und die Alchimisten (1879, 2nd ed. 1889); article in Allgemeine deutsche Biographie.

Giddings, Joshua Reed (1795-1864), American statesman, prominent in the anti-slavery conflict, was born at Tioga Point, now Athens, Bradford county, Pennsylvania, on the 6th of October 1795. In 1806 his parents removed to Ash tabula county, Ohio, then sparsely settled and almost a wilderness. The son worked on his father's farm, and, though he received no systematic education, devoted much time to study and reading. For several years after 1814 he was a school teacher, but in February 1821 he was admitted to the Ohio bar and soon obtained a large practice, particularly in criminal cases. From 1831 to 1837 he was in partnership with Benjamin F. Wade. He served in the lower house of the state legislature in 1826-1828, and from December 1838 until March 1859 was a member of the national House of Representatives, first as a Whig, then as a Free-soiler, and finally as a Republican. Recognizing that slavery was a state institution, with which the Federal government had no authority to interfere, he contended that slavery could only exist by a specific state enactment, that therefore slavery in the District of Columbia and in the Territories was unlawful and should be abolished, that the coastwise slave-trade in vessels flying the national flag, like the international slave-trade, should be rigidly suppressed, and that Congress had no power to pass any act which in any way could be construed as a recognition of slavery as a national institution. His attitude in the so-called "Creole Case" attracted particular attention. In 1841 some slaves who were being carried in the brig "Creole" from Hampton Roads, Virginia, to New Orleans, revolted, killed the captain, gained possession of the vessel, and soon afterwards entered the British port of Nassau. Thereupon, according to British law, they became free. The minority who had taken an active part in the revolt were arrested on a charge of murder, and the others were liberated. Efforts were made by the United States government to recover the slaves, Daniel Webster, then secretary of state, asserting that on an American ship they were under the jurisdiction of the United States and that they were legally property. On the 21st of March 1842, before the case
GIDEON—GIERS

was settled, Giddings introduced in the House of Representatives a series of resolutions, in which he asserted that “in resuming their natural rights of personal liberty” the slaves “violated no law of the United States.” For offering these resolutions Giddings was attacked with rancour, and was formally censured by the House. Thereupon he resigned, appealed to his constituents, and was elected Successor to the seat he had vacated. At the election of 1859 he was not renominated, and retired from Congress after a continuous service of more than twenty years. From 1861 until his death, at Montreal, on the 27th of May 1864, he was U.S. consul-general in Canada. Giddings published a series of political essays signed “Pacificus” (1843); Speeches in Congress (1853); The Exiles of Florida (1858); and A History of the Rebellion: Its Authors and Causes (1864).

See The Life of Joshua B. Giddings (Chicago, 1892), by his son-in-law, George Washington Julian (1817-1899), a Free-soil leader and a representative in Congress in 1849-1851; a Republican representative in Congress in 1865-1871, a Liberal Republican in the campaign of 1872, and afterwards a Democrat.

GIDEON (in Hebrew, perhaps “beaver” or “warrior”), liberator, reformer and “judge” of Israel, was the son of Joash, of the Manassite clan of Abiezer, and had his home at Ophrah near Shechem. His name occurs in Heb. xi. 32, in a list of those who became heroes by faith; but, except in Judges vi.-viii., is not to be met with elsewhere in the Old Testament. He lived at a time when the nomad tribes of the south and east made inroads upon Israel, destroying all that they could carry away. Two accounts of his deeds are preserved (see Judges). According to one (Judges vi. 11-24) Yahweh appeared under the holy tree which was in the possession of Joash and summoned Gideon to undertake, in dependence on supernatural direction and help, the work of liberating his country from its long oppression, and, in token that he accepted the mission, he erected in Ophrah an altar which he called “Yahweh-Shalom” (Yahweh is peace). According to another account (vi. 25-32) Gideon was a great reformer who was commanded by Yahweh to destroy the golden calves into which the people had fallen, bringing to his father and the asherah or sacred post by its side. The townspeople discovered the sacrilege and demanded his death. His father, who, as guardian of the sacred place, was priest of Abiezer, enjoined the men not to take up Baal’s quarrel, for “if Baal be a god, let him contend (rib) for himself.” Hence Gideon received the name Jerubbaal. From this latter name appearing regularly in the older narrative (cf. ix.), and from the varying usage in vi.-viii., it has been held that stories of two distinct heroes (Gideon and Jerubbaal) have been fused in the complicated account which follows.

The great deliverer of the Midianites and their allies on the north side of the plain of Jezreel; the general muster first of Abiezer, then of all Manasseh, and lastly of the neighbouring tribes of Asher, Zebulon and Naphtali; the signs by which the wavering faith of Gideon was steadied; the methods by which an unwieldy mob was reduced to a small but trustworthy band of energetic and determined men; and the stratagem by which the vast army of Midian was surprised and routed by the handful of Israelites descending from “above Endor,” are indicated fully in the narratives, and need not be detailed here. The difficulties in the account of the subsequent flight of the Midianites appear to have arisen from the composite character of the narratives, and there are signs that in one of them Gideon was accompanied only by his own clansmen (vi. 34). So, when the Midianites are put to flight, according to one representation, the Ephraimites are called out to intercept them, and the two chiefs, Oreb (“raven”) and Zeeb (“wolf”), in making for the fords of the Jordan, are slain at “the raven’s rock” and “the wolf’s rock.” As to this last among his steps there are two: the Ephraimites quarrelled with Gideon because their assistance had not been invoked earlier, and their anger was only appeased by his tactful reply (viii. 1-3; contrast xii. 1-6). The other narrative speaks of the pursuit of the Midianite chiefs Zebah and Zalmunna across the northern end of Jordan, past Succoth and Penuel to the unidentified place Karkor. Having taken relentless vengeance on the men of Penuel and Succoth, who had shown a timid neutrality when the patriotic struggle was at its crisis, Gideon puts the two chiefs to death to avenge his brothers whom they had killed at Tabor. The overthrow of Midian (cf. Is. ix. 4, x. 26; Ps. lxxiii. 9-12) induced “Israel” to offer Gideon the kingdom. It was refused—out of religious scruples (viii. 22 seq.; cf. 1 Sam. vii. 12, 17, 19), and the ephod idol which he set up at Ophrah in commemoration of the victory was regarded by a later editor (v. 27) as a cause of apostasy to the people and a snare to Gideon and his house; see, however, Ephraim. Gideon’s achievements would naturally give him a more than merely local authority, and after his death the attempt was made by one of his sons to set himself up as chief (see Abimelech).

See further Jews, section 1; and the literature to the book of Judges.

GIEBEL, CHRISTOPH GOTTFRIED ANDREAS (1820-1881), German zoologist and palaeontologist, was born on the 13th of September 1820 at Quedlinburg in Saxony, and educated at the university of Halle, where he graduated Ph. D. in 1845. In 1856 he became professor of zoology and director of the museum in the university of Halle. He died at Halle on the 14th of November 1881. His chief publications were Palaeocozoa (1846); Fauna der Vorwelt (1847-1856); Deutschlands Petschfalten (1852); Odontographie (1855); Lehrbuch der Zoologie (1872); Thesaurus ornithologice (1872-1877).

GIEN, a town of central France, capital of an arrondissement in the department of Loiret, situated on the right bank of the Loire, 39 m. E.S.E. of Orleans by rail. Pop. (1906) 6325. Gièn is a picturesque and interesting town and has many curious old houses. The Loire is here crossed by a stone bridge of twelve arches, built by Abbe Beanjeu, daughter of Louis XI., about the end of the 15th century. Near it stands a statue of Ver- cingétorix. The principal building is the old castle used as a law-court, constructed of brick and stone arranged in geometrical patterns, and built in 1494 by Anne de Beaujeu. The church of St Pierre possesses a square tower dating from the end of the 15th century. Porcelain is manufactured.

GIERS, NICHOLAS KARLOVICH DE (1832-1893), Russian statesman, was born on the 21st of May 1832. Like his pre- ceding chief, Prince Gorchakov, he was educated at the lyceum of Tsarskoje Selo, near St Petersburg, but his career was much less rapid, because he had no influential protectors, and was hand- capped by being a Protestant of Teutonic origin. At the age of eighteen he entered the service of the Eastern department of the ministry of foreign affairs, and spent more than twenty years in subordinate posts, chiefly in south-eastern Europe, until he was promoted in 1863 to the post of minister pleni- potentiary in Persia. Here he remained for six years, and, after serving as a minister in Switzerland and Sweden, he was appointed in 1875 director of the Eastern department and assistant minister for foreign affairs under Prince Gorchakov, whose niece he had married. No sooner had he entered on his new duties than his great capacity for arduous work was put to a severe test. Besides events in central Asia, to which he had to devote much attention, the Herzegovinian insurrection had broken out, and he could perceive from secret official papers that the incident had far-reaching ramifications unknown to the general public. Soon this became apparent to all the world. was at this crisis, Giers in the minister with hardly a pretence of concealment, were assisting the insurgents, Russian volunteers were flocking to Servia with the connivance of the Russian and Austrian governments, and General Ignatiev, as ambassador in
Constantinople, was urging his government to take advantage of the palpable weakness of Turkey for bringing about a radical solution of the Eastern question. Prince Gorchakov did not want a radical solution involving a great European war, but he was too fond of Colonel Giesebricht, who was one of the two men whom he considered the most distinguished in the Russian foreign service. Alexander II., personally averse from war, was not insensible to the patriotic enthusiasm, and halted between two opinions. M. de Giers was one of the few who gauged the situation accurately. As an official and a man of non-Russian extraction he had to be extremely reticent, but to his intimate friends he condemned severely the ignorance and light-hearted recklessness of those around him. The event justified his sombre previsions, but did not cure the recklessness of the so-called patriots. They wished to defy Europe in order to maintain intact the treaty of San Stefano, and again M. de Giers found himself in an unpopular minority. He had to remain in the background, but all the influence he possessed was thrown into the scale of peace. His views, energetically supported by Count Shuvalov, finally prevailed, and the European congress assembled at Berlin. He was not present at the congress, and consequently escaped the popular odium for the concessions which Russia had to make to Great Britain and Austria. From that time he was practically minister of foreign affairs, for Prince Gorchakov was no longer capable of continued intellectual exertion, and lived mostly abroad. On the death of Alexander II. in 1881 it was generally expected that M. de Giers would be dismissed as deficient in Russian national feeling, for Alexander III. was credited with strong anti-German Slavophil tendencies. In reality the young tsar had no intention of embarking on wild political adventures, and was fully determined not to let his hand be forced by men less cautious than himself. What he wanted was a minister of foreign affairs who would be at once vigilant and prudent, active and obedient, and who would guard against the trouble and worry of routine work while allowing him to control the main lines, and occasionally the details, of the national policy. M. de Giers was exactly what he wanted, and accordingly the tsar not only appointed him minister of foreign affairs on the retirement of Prince Gorchakov in 1882, but retained him to the end of his reign in 1894. In accordance with the desire of his august master, M. de Giers followed systematically a pacific policy. Accepting as a fait accompli the existence of the triple alliance, created by Bismarck for the purpose of repressing Austria's aggrandisement, and the decision of Russia and France, he sought to establish more friendly relations with the cabinets of Berlin, Vienna and Rome. To the advances of the French government he at first turned a deaf ear, but when the rapprochement between the two countries was effected with little or no co-operation on his part, he utilized it for restraining France and promoting Russian interests. He died on the 26th of January 1895, soon after the accession of Nicholas II. (D. M. W.).

GIESEBRECHT, WILHELM VON (1814-1889), German historian, was a son of Karl Giesebricht (1792-1873). Born in Berlin on the 5th of March 1814, he studied under Leopold von Ranke, and his first important work, Geschichte Otto's II., was contributed to Ranke's Jahrbücher des deutschen Reichs unter dem sächsischen Hause (Berlin, 1837-1840). In 1841 he published his Jahrbücher des Klosters Altach, a reconstruction of the lost Annales Alta- henses, a medieval source of which fragments only were known to be extant, and these were obscure in other chronicles. The brilliance of this performance was shown in 1867, when a copy of the original chronicle was found, and it was seen that Giese- bricht had been substantially correct. In the meantime he had been appointed Oberlehrer in the Joachimsthaler Gymnasium in Berlin; had paid a visit to Italy, and as a result of his researches there he published De litterarum studiis apud Italos primis mediis aevi secundis (Berlin, 1845), a study upon the survival of culture in Italian cities during the middle ages, and also several critical essays upon the sources for the early history of the popes. In 1851 appeared his translation of the Historiae of Gregory of Tours, which is the standard German translation. Four years later appeared the first volume of his great work, Geschichte der deutschen Kaiserzeit, the fifth volume of which was published in 1888. This work was the first in which the results of the scientific methods of research were thrown open to the world at large. Lengths of style and brilliance of portrayal are devoted to an absolute mastery of the sources in a way hitherto unachieved by any German historian. Yet later German historians have severely criticized his glorification of the imperial era with its Italian entanglements, in which the interests of Germany were sacrificed for idle glory. Giesebricht's history, however, appeared when the new German empire was in the making, and became popular owing both to its patriotic tone and its intrinsic merits. In 1857 he went to Königsberg as professor ordinarius, and in 1862 succeeded H. von Sybel as professor of history in the university of Munich. The Bavarian government honoured him in various ways, and he died at Munich on the 17th of December 1889. In addition to the works already mentioned, Giesebricht published a good monograph on Arnold of Brescia (Munich, 1873), a collection of essays under the title Deutsche Reden (Munich, 1871), and was an active member of the group of scholars who took over the direction of the Monumenta Germaniae Historica in 1875. In 1895 B. von Simson added a sixth volume to the Geschichte der deutschen Kaiserzeit, thus bringing the work down to the death of the emperor Frederick I. in 1388.

GIESELER, JOHANN KARL LUDWIG (1792-1854), German writer on church history, was born on the 3rd of March 1792 at Petershagen, near Minden, where his father, Georg Christof Friedrich, was preacher. In his tenth year he entered the orphanage at Halle, whence he duly passed to the university, his studies being interrupted, however, from October 1813 till the peace of 1815 by a period of military service, during which he was enrolled as a volunteer in a regiment of chasseurs. On the conclusion of peace (1815) he returned to Halle, and, having in 1817 taken his degree in philosophy, he in the same year became assistant head master (Corrector) in the Minden gymnasium, and in 1818 was appointed director of the gymnasium at Cleves. Here he published his earliest work (Historisch- kritischer Versuch über die Entstehung u. die frühesten Schicksale der schriftlichen Evangelien), a treatise which had considerable influence on subsequent investigations as to the origin of the gospels. In 1819 Gieseler was appointed a professor ordinarius in theology in the newly founded university of Bonn, where, besides lecturing on church history, he made important contributions to the literature of that subject in Ernst Rosenmüller's Reperitorio, K. F. Stäudlin and H. G. Tschirner's Archiv, and in various university "programs." The first part of the first volume of his well-known Church History appeared in 1824. In 1831 he accepted a call to Göttingen as successor to J. G. Planck. He lectured on church history, the history of dogma, and dogmatic theology. In 1837 he was appointed a Consistorialrat, and shortly afterwards was created a knight of the Guelphic order. He died on the 8th of July 1854. The fourth and fifth volumes of the Kirchengeschichte, embracing the period subsequent to 1814, were published posthumously in 1855 by E. R. Redepenning (1810-1883); and they were followed in 1856 by a Dogmengeschichte, which is sometimes reckoned as the sixth volume of the Church History. Among church historians Gieseler continues to hold a high place. Less vivid and picturesque in style than Karl Hase, conspicuously deficient in Nesselmann's deep and sympathetic insight into the more spiritual forces by which church life is pervaded, he excels these and all other contemporaries in the fulness and accuracy of his information. His Lehrbuch der Kirchengeschichte, with its copious references to original authorities, is of great value to the student: "Gieseler wished that each age should speak for itself, since only by this means can the peculiarity of its ideas be fully appreciated." (Otto Pfleiderer, Development of Theology, p. 264). The work, which has passed through several editions in Germany, has partially appeared also in two English translations. That
GIFFORD, R. S.

published in New York (Text Book of Ecclesiastical History, 5 vols.) brings the work down to the peace of Westphalia, while that published in "Clark's Theological Library" (Compendium of Ecclesiastical History, Edinburgh, 5 vols.) closes with the beginning of the Reformation. Giesler was not only a devoted student but also an energetic man of business. He frequently held the office of pro-rector of the university, and did much useful work as a member of several of its committees.

GIESSEN, a town of Germany, capital of the province of Upper Hesse, in the grand-duchy of Hesse-Darmstadt, is situated in a beautiful and fruitful valley at the confluence of the Wiesec with the Lahn, 41 m. N.W. of Frankfort-on-Main on the railway to Cassel, and at the junction of important lines to Cologne and Coblenz. Pop. (1853) 18,836; (1905) 39,149. In the old part of the town the streets are narrow and irregular. Besides the university, the principal buildings are the Stadtkirche, the provincial government offices, comprising a portion of the old castle dating from the 12th century, the arsenal (now barracks) and the town-hall (containing an historical collection). The university, founded in 1607 by Louis V., landgrave of Hesse, has a large and valuable library, a botanical garden, an observatory, medical schools, a museum of natural history, a chemical laboratory which was directed by Justus von Liebig; professor here from 1824 to 1832, and an agricultural college. The industries include the manufacture of woolen and cotton cloth of various kinds, machines, leather, candles, tobacco and tobacco pipes.

Giesse, the name of which is probably derived from the streams which pour (giesen) their waters here into the Lahn, was formed in the 12th century out of the villages Selters, Aster and Kropph, for whose protection Count William of Gleiberg built the castle of Giesse. Through marriage the town came, in 1203, into the possession of the count palatine, Rudolph of Tübingen, who sold it in 1265 to the landgrave Henry of Hesse. It was surrounded with fortifications in 1530, which were demolished in 1547, but rebuilt in 1560. In 1809 they were finally pulled down, and their site converted into promenades.

See O. Buchner, Führer für Giesse und das Lahnthal (1891); and Aus Giesens Vergangenheit (1885).

GIFFORD, GODFREY (c. 1255–1302), chancellor of England and bishop of Worcester, was a son of Hugh Gifford of Boyton, Wiltshire. Having entered the church he speedily obtained valuable prebendaries owing to the influence of his brother Walter, who became chancellor of England in 1262. In 1266 Godfrey became chancellor of the exchequer, succeeding Walter as chancellor of England when, in the same year, the latter was made archbishop of York. In 1268 he was chosen bishop of Worcester, resigning the chancellorship shortly afterwards; and in 1271 he was made bishop of Worcester. When he inherited the valuable property of his brother the archbishop, he was employed on public business by Edward I. His main energies, however, were devoted to the affairs of his see. He had one long dispute with the monks of Worcester, another with the abbot of Westminster, and was vigilant in guarding his material interests. The bishop died on the 26th of January 1302, and was buried in his cathedral. Gifford, although inclined to nepotism, was a benefactor to his cathedral, and completed and fortified the episcopal castle at Hartlebury.

GIFFORD, WALTER(d. 1279), chancellor of England and archbishop of York, was a son of Hugh Gifford of Boyton, Wiltshire, and after serving as canon and archdeacon of Wells, was chosen bishop of Bath and Wells in May 1264. In August 1265 Henry III. appointed him chancellor of England, and he was one of the arbitrators who drew up the dictum de Kenilworth in 1266. Later in this year Pope Clement IV. named him archbishop of York, and having resigned the chancellorship he was an able and diligent ruler of his see, although in spite of his great wealth he was frequently in pecuniary difficulties. When Henry III. died in November 1274 the archbishopric of Canterbury was vacant, and consequently the great seal was delivered to the archbishop of York, who was the chief of the three regents who successfully governed the kingdom until the return of Edward I. in August 1274. Having again acted in this capacity for nearly a year, Gifford died in April 1279, and was buried in his cathedral.

Giffard, William (d. 1129), bishop of Winchester, was chancellor of William II. and received his see, in succession to Bishop Walkelin, from Henry I. (1100). He was one of the bishops elect whom Anselm refused to consecrate (1101) as having been nominated and invested by the lay power. During the investitures dispute Giffard was on friendly terms with Anselm, and drew upon himself a sentence of banishment through declining to accept consecration from the archbishop of York (1103). He was, however, one of the bishops who pressed Anselm, in 1106, to give way to the king. He was consecrated after the settlement of 1107. He became a close friend of Anselm, aided the first Cistercians to settle in England, and restored Winchester cathedral with great magnificence.

Giffen, Sir Robert (1837–1910), British statistician and economist, was born at Stratheaven, Lanarkshire. He entered a solicitor's office in Glasgow, and while in that city attended courses at the university. He drifted into journalism, and after working for the Stirling Journal he went to London in 1862 and joined the staff of the Globe. He also assisted Mr John (afterwards Lord) Morley, when the latter edited the Fortnightly Review. In 1868 he became Walter Bagehot's assistant-editor on the Economist, and his services were also secured in 1873 as city-editor of the Daily News, and later of The Times. His high reputation as a financial journalist and statistician, gained in these years, led to his appointment in 1876 as head of the statistical department in the Board of Trade, and subsequently he became assistant secretary (1882) and finally controller-general (1892), retiring in 1897. In connexion with his position as chief statistical adviser to the government, he was constantly employed in drawing up reports, giving evidence before commissions of inquiry, and acting as a government auditor, besides preparing a number of important essays on financial subjects. His principal publications were Essays on Finance (1879 and 1884), The Progress of the Working Classes (1884), The Growth of Capital (1890), The Case against Bimetallism (1892), and Economic Inquiries and Studies (1904). He was president of the Statistical Society (1882–1884); and after being made a C.B. in 1891 was created K.C.B. in 1895. In 1892 he was elected a Fellow of the Royal Society. Sir Robert Giffen continued in later years to take a leading part in all public controversies connected with finance and taxation, and his high authority and practical experience were universally recognized. He died somewhat suddenly in Scotland on the 12th of April 1910.

Gifford, Robert Swain (1840–1902), American marine and landscape painter, was born on Naushon Island, Massachusetts, on the 23rd of December 1840. He studied art with the Dutch marine painter Albert van Beest, who had a studio in New Bedford, and in 1864 he opened a studio for himself in Boston, subsequently settling in New York, where he was elected an associate of the National Academy of Design in 1867 and an academician in 1875. He was a member of the American Water Color Society and the Society of American Artists. From 1878 until 1896 he was teacher of painting and chief master of the Woman's Art School of Cooper Union, New York, and from 1896 until his death he was director. Gifford painted longshore views, sand dunes and landscapes generally, with charm and poetry. He was an etcher of considerable reputation, a member of the Society of American Etchers, and an honorary member of the Society of Painter-Etchers of London. He died in New York on the 13th of January 1902.
GIFT (a common Teutonic word, cf. Ger. die Gift, gift, das Gift, poison, formed from the Teut. stem *gub-*, to give, cf. Dutch gesen, Ger. geben; L. O. Eng. the word appears with initial *y*, the genitive of later English a gift). The word has been used by a general English term for a present or thing bestowed, i.e. an alienation of property otherwise than for a legal consideration, although in law it is often used to signify alienation with or without consideration. By analogy the terms “gift” and “gifted” are also used to signify the natural endowment of some special ability, or a miraculous power, in a person, as being not acquired in the ordinary way. The legal effect of a gratuitous gift only need be considered here. Formerly in English law, property in land could be conveyed by one person to another by a verbal gift of the estate accompanied by delivery of possession. The Statute of Frauds required all such conveyances to be in writing, and a later statute (8 & 9 Vict. c. 106) requires them to be by deed. Personal property may be effectually transferred from one person to another by a simple verbal gift accompanied by delivery. If A delivers a chattel to B, saying or signifying that he does so by way of gift, the property passes, and the chattel belongs to B. But unless the actual thing is bodily handed over to the donee, the mere verbal expression of delivery is not sufficient to convey the property. The persons are in the position of parties to an agreement which is void as being without consideration. When the nature of the thing is such that it cannot be bodily handed over, it will be sufficient to put the donee in such a position as to enable him to deal with it as the owner. For example, when goods are in a warehouse, the delivery of the key will make a verbal gift of them effectual; but it seems that part delivery of goods which are capable of actual delivery will not validate a verbal gift of the part undelivered. So when goods are in the possession of a warehouseman, the handing over of a delivery order might, by special custom (but not otherwise, it appears), be sufficient to pass the property in the goods, although delivery of a bill of lading for goods at sea is equivalent to an actual delivery of the goods themselves.

GIFU (IMAZUMI), a city of Japan, capital of the ken (government) of Central Nippon, which comprises the two provinces of Mino and Hida. Pop. about 41,000. It lies E. by N. of Lake Biwa, on the Central railway, on a tributary of the river Kiso, which flows to the Bay of Miyato Ura. Manufactures of silk and paper goods are carried on. The ken has an area of about 4,000 sq. m. and is thickly peopled, the population exceeding 1,000,000. The whole district is subject to frequent earthquakes.

GIG, apparently an onomatopoeic word for any light whirring object, and so used of a top, as in Shakespeare’s Love’s Labour’s Lost, v. i. 70 (“Goe whip thy gige”), or of a revolving lure made of feathers for snaring birds. The word is now chiefly used of a light two-wheeled cart or carriage for one horse, and of a narrow, light, ship’s boat for oars or sails, and also of a clinker-built rowing-boat used for rowing on the Thames. “Gig” is further applied, in mining, to a wooden chamber or box divided in the centre and used to draw miners up and down a pit or shaft, and to a textile machine, the “gig-mill” or “gigging machine,” which raises the nap on cloth by means of teazels. A “gig” or “fish-gig” (properly “fiz-gig,” possibly an adaptation of Span. fisga, harpoon) is an instrument used for spearing fish.

GIGLIO (anc. Igilium), an island of Italy, off the S.W. coast of Italy, off the province of Grosseto, 11 m. off the W. of Monte Argentario, the nearest point on the coast. It measures about 5 m. by 3 and its highest point is 1634 ft. above sea-level. Pop. (1901) 2062. It is partly composed of granite, which was quarried here by the Romans, and is still used; the island is fertile, and produces wine and fruit, the cultivation of which has taken the place of the forests of which Rutilius spoke (Hirt. i. 325, “eminus Igilii silvosa cacumina miror”). Julius Caesar mentions its sailors in the fleet of Domitius Ahenobarbus. In Rutilius’ time it served as a place of refuge from the barbarian invaders. Charlemagne gave it to the abbey of Tre Fontane at Rome. In the 14th century it belonged to Pisa, then to Florence.

Gifford, Sanford Robinson (1823–1880), American landscape painter, was born at Greenfield, New York, on the 10th of July 1823. He studied (1842–1845) at Brown University, then to New York, and entered the art gallery of the National Academy of Design, of which organization he was elected an associate in 1851, and an academician in 1854. Subsequently he studied in Paris and Rome. He was one of the best known of the Hudson River school group, though it was at Lake George that he found most of his themes. In his day he enjoyed an enormous popularity, and his canvases are in many well-known American collections. He died in New York City on the 29th of August 1880.

William (1756–1836), English publicist and man of letters, was born at Ashburton, Devon, in April 1756. His father was a glazier of indifferent character, and before he was thirteen William had lost both parents. The business was seized by his godfather, on whom William and his brother, a child of two, became entirely dependent. For about three months William was allowed to remain at the free school of the town. He was then put to follow the plough, but after a day’s trial he proved unequal to the task, and was sent to sea with the Brixham fishermen. After a year at sea his godfather, driven by circumstances, gave up the management of the store, and William was driven to find work in the capacity of tutor to his son, Lord Belgrave. Settling in London, Gifford published in 1794 his first work, a clever satirical piece, after Persius, entitled the Battis, aimed at a coterie of second-rate writers at Florence, then popularly known as the Della Cruscans, of which Mrs Piozzi was the leader. A second satire of a similar description, the Maeviad, directed against the corruptons of the drama, appeared in 1795. About this time Gifford became acquainted with Canning, with whose help he in August 1797 originated a weekly newspaper of Conservative politics entitled the Anti-Jacobin, which, however, in the following year ceased to be published. An English version of Juvenal, on which he had been for many years engaged, appeared in 1802; to this an autobiographical notice of the translator, reproduced in Nichol’s Illustrations of Literature, was prefixed. Two years afterwards Gifford published an annotated edition of the plays of Massinger; and in 1809, when the Quarterly Review was projected, he was made editor. The success which attended the Quarterly from the outset was due in no small degree to the ability and tact with which Gifford discharged his editorial duties. He took, however, considerable liberties with the articles he inserted, and Southey, who was one of his regular contributors, said that Gifford looked on authors as Isaac Walton did on worms. His bitter opposition to Radicals and his onslaughts on new writers, conspicuous among which was the article on Keats’s Endymion, called forth Hazlitt’s Letter to W. Gifford in 1815, and in connexion with the Review continued until within about two years of his death, which took place in London on the 31st of December 1826. Besides numerous contributions to the Quarterly during the last fifteen years of his life, he wrote a metrical translation of Persius, which appeared in 1821. Gifford also edited the dramas of Ben Jonson in 1816, and his edition of Fody appeared posthumously in 1827. His notes on Shirley were incorporated in Dyce’s edition in 1833. His political services were acknowledged by the appointments of commissioner of the lottery and paymaster of the gentleman pensioners. He left a considerable fortune, the bulk of which went to the son of his first benefactor, William Cooksley.
then, after being seized by the Spanish fleet, it was ceded to Antonio Piccolomini, nephew of Pius II. In 1558 it was sold to the wife of Cosimo I. of Florence.

See Archduke Ludwig Salvator, Die Insel Giglio (Prague, 1900).

GIJÓN, a seaport of northern Spain, in the province of Oviedo; on the Bay of Biscay, and at the terminus of railways from Avilés, Oviedo and Langreo. Pop. (1900) 47,544. The older parts of Gijón, which are partly enclosed on all sides by hills that occupy the upper slopes of a peninsular headland, Santa Catalina Point; while its more modern suburbs extend along the shore to Cape Torres, on the west, and Cape San Lorenzo, on the east. These suburbs contain the town-hall, theatre, markets, and a bull-ring with seats for 12,000 spectators. Few of the buildings of Gijón are noteworthy for any architectural merit, except perhaps the 15th-century parish church of San Pedro, which has a triple row of aisles on each side, the palace of the marquesses of Revillagigedo (or Revilla Gigedo), and the Asturian Institute or Jovellanos Institute. The last named has a very fine collection of drawings by Spanish and other artists, a good library and classes for instruction in seamanship, mathematics and languages. It was founded in 1797 by the poet and statesman Gaspar Melchor de Jovellanos (1744-1811). Jovellanos, a native of Gijón, is buried in San Pedro.

The Bay of Gijón is the most important roadstead on the Spanish coast between Ferrol and Santander. Its first quay was constructed by means of a grant from Charles V. in 1552-1554; and its arsenal, added in the reign of Philip II. (1556-1598), was used as a repairing station for the large ships of the Invincible Armada. A new quay was built in 1766-1768, and extended in 1859; the harbour was further improved in 1864, and after 1892, when the Musel harbour of refuge was created at the extremity of the bay. It was, however, the establishment of railway communication in 1884 which brought the town its modern prosperity, by rendering it the chief port of shipment for the products of Langreo and other mining centres in Oviedo. A rapid commercial development followed. Besides large tobacco, glass and porcelain factories, Gijón possesses iron foundries and petroleum refineries; while its minor industries include fisheries, and the manufacture of preserved foods, soap, chocolate, candles and liqueurs. In 1903 the harbour accommodated 2189 vessels of 385,375 tons. In the same year the imports, consisting chiefly of machinery, iron, wood and food-stuffs, were valued at £666,889; while the exports, comprising zinc, copper, iron and other minerals, with fish, nuts and farm produce, were valued at £496,443.

Gijón is largely supplied with the Gielga of the Romans, which, however, occupied the site of the adjoining suburb of Cima de Villa. Early in the 8th century Gijón was captured and strengthened by the Moors, who used the stones of the Roman city for their fortifications, but were expelled by King Pelayo (720-737). In 844 Gijón successfully resisted a Norman raid; in 1395 it was burned down; but thenceforward it gradually rose to commercial importance.

GILÁN (Ghilán, Gilúan), one of the three small but important Caspian provinces of Persia, lying along the southern western shore of the Caspian Sea between 48° 50' and 50° 36' E., with a breadth varying from 15 to 50 m. It has an area of about 5000 sq. m. and a population of about 250,000. It is separated from Russia by the little river Astara, which flows into the Caspian, and bounded W. by Azerbiján, S. by Kazvin and E. by Mazendaran. The greater portion of the province is a lowland region extending inland from the sea to the base of the mountains of the Elburz range and, though the Sefíd Rúd (White river), which is called Kizil Uzain in its upper course and has its principal sources in the Alps of Kuh-i-Kuh-i-Khorassan, is the only river of any size, the province is abundantly watered by many streams and an exceptionally great rainfall (in some years 50 in.).

The vegetation is very much like that of southern Europe, and in consequence of the great humidity and the mild climate almost tropically luxuriant, and the forests from the shore of the sea up to an altitude of nearly 5000 ft. on the mountain slopes facing the sea are as dense as an Indian jungle. The prevailing types of trees are the oak, maple, hornbeam, beech, ash and elm. The box tree comes to rare perfection, but in consequence of indiscriminate cutting for export during many years, is now becoming scarce. Of fruit trees the apple, pear, plum, cherry, medlar, pomegranate, fig, quince, as well as two kinds of vine, grow wild; oranges, sweet and bitter, and other Aurantiaceae thrive well in gardens and plantations. The fauna is also rich and numerous. But the birds, which are more generally seen are now very scarce; panther, hyena, jackal, wild boar, deer (Cervus malda) are common; pheasant, woodcock, ducks, teal, goose and various waterfowl abound; the fisheries are very productive and are leased to a Russian firm. The ordinary cattle of the province is the small humped kind, Bos indicus, and forms an article of export to Russia, the humps, smoked, being much in demand as a delicacy. Rice of a kind not much appreciated in Persia, but much esteemed in Gilán and Russia, is largely cultivated and a quantity valued at about £20,000 was exported to Russia during 1904-1905. Tea plantations, with seeds and plants from Assam, Ceylon and the Himalayas, were started in the early part of 1900 on the slopes of the hills south of Resht at an altitude of about 1000 ft. The results were excellent and very good tea was produced in 1904 and 1905, but the Persian government gave no support and the enterprise was neglected. The olive thrives well at Rúdbár and Manjil in the Sefíd Rúd valley and the oil extracted from it by a Provengal for some years until 1896, when he was murdered, was of very good quality and found a ready market at Baku. Since then the oil has been, as before, only used for the manufacture of soap. Tobacco from Turkish seed, cultivated since 1875, grows well, and a considerable quantity of it is exported. The most valuable produce of the province is silk. In 1886 it was valued at £743,000 and about two-thirds of it was exported. The silk-worm disease appeared in 1894 and the crops decreased in consequence until 1893 when the value of the silk exported was no more than £5000. Since then there has been a steady improvement, and in 1905-1906 the value of the produce was estimated at £30,000 and that of the quantity exported at £50,000. The eggs of the silk-worms, formerly obtained from Japan, are now imported principally from Brussa by Greeks under French protection and from France.

There is only one good road in the province, that from Enzeli to Kazvin by way of Resht; in other parts communication is by narrow and frequently impassable lanes through the thick forest, or by intricate pathways through the dense undergrowth.

The province is divided into the following administrative divisions: Gilán and Resht, which include the capital and its immediate suburbs, (Resht-foothood), Fumen (with Talum and Mésula, where are iron mines), Gesker, Talish (with Shandarman, Kerganrud, Ašalim, Gil-Dub, Talish-Dub), Enzeli (the port of Resht), Sheft, Manjil (with Rametabad and Aamaru), Lahijan (with Langard, Rúdsar and Ranehkuh), Dilmán and Lashtínia. The revenue derived from taxes and customs is about £80,000. The crown lands have been much neglected and the revenue from them amounts to hardly £3000 per annum. The value of the exports and imports from and into Gilán, much of them in transit, is close upon £2,000,000.

Gilán was an independent khanate until 1567 when Khan Ahmed, the last of the Kargia dynasty, which had reigned 205 years, was deposed by Tahmasp I, the second Safavid shah of Persia (1524-1576). It was occupied by a Russian force in the early part of 1723; and Tahmasp III, the tenth Safavid shah (1722-1731), then without a throne and his country occupied by the Afghans, ceded it, together with Mazendaran and Astara-bad, to Peter the Great by a treaty of the 12th of September of that year. Russia occupied the remains in Gilán until 1734, when they were compelled to evacuate it.

The derivation of the name Gilán from the modern Persian word Gil meaning mud (hence "land of mud") is incorrect. It probably means "land of the Gil," an ancient tribe which classical writers mention as the Gelae.

GILBERT, JAMES WILLIAM (1794-1863), English writer on banking, was born in London on the 21st of March 1794. From
GILBERT, ALFRED—GILBERT, SIR H.

1813 to 1825 he was clerk in a London bank. After a two years' residence in Birmingham, he was appointed manager of the Kilkenny branch of the Provincial Bank of Ireland, and in 1829 he was promoted to the Waterford branch. In 1834 he became manager of the London and Westminster Bank; and he did much to develop the system of joint-stock banking. On more than one occasion he rendered valuable services to the banks of his city, when committees of the House of Commons; and, on the renewal of the bank charter in 1844, he procured the insertion of a clause granting to joint-stock banks the power of suing by their public officer, and also the right of accepting bills at less than six months' date. In 1846 he was elected a fellow of the Royal Society. He died in London on the 8th of August 1863. The Gilbert lectures on banking at King's College are called after him.

The following are his principal works on banking, most of which have passed through more than one edition: Practical Treatise on Banking (1827); The History and Principles of Banking (1834); The History of Banking in America (1837); Lectures on the History and Principles of Ancient Commerce (1847); Logic for the Million (1851); and Logic of Banking (1857).

GILBERT, ALFRED (1854— ), British sculptor and goldsmith, born in London, was the son of Alfred Gilbert, musician. He received his education mainly in Paris (École des Beaux-Arts, under Cavelier), and studied in Rome and Florence where the significance of the Renaissance made a lasting impression on him and his art. He also worked in the studio of Sir Joseph一会ctor Benson, R.A. His first work of importance was the charming group of the "Mother and Child," then "The Kiss of Victory," followed by "Perseus Arming" (1883), produced directly under the influence of the Florentine masterpieces he had studied. Its success was great, and Lord Leighton forthwith commissioned "Icarus," which was exhibited at the Royal Academy in 1884, along with a remarkable "Study of a Head," and was received with general applause.

Then followed "The Enchanted Chair," which, along with many others, had been the artist's first effort, and which, treat of the ornamental character, was afterwards completely or unworthy of his powers, was ultimately broken by the sculptor's own hand. The next year Mr Gilbert was occupied with the shaftsbury Memorial Fountain, in Piccadilly, London, a work of great originality and beauty, yet shorn of some of the intended effect through restrictions put upon the artist. In 1888 was produced the statue of H.M. Queen Victoria, set up at Winchester, in its main design and in the details of its ornamentation the most remarkable work of his kind produced in Great Britain, and perhaps, it may be added, in any other country in modern times. Of great originality and beauty, and fine in design, are those set up at Lord Reay in Bombay, and John Howard at Bedford (1892), the highly original pedestal of which did much to direct into a better channel what are apt to be the eccentricities of what is called the "New Art" School. The sculptor rose to the full height of his powers in his "Memorial to the Duke of Clarence," and his fast developing fancy and imagination, which are the main characteristics of all his work, are seen in his "Memorial Candelabrum to Lord Arthur Russell" and "Memorial Font to the son of the 4th Marquess of Bath." Gilbert's sense of decoration is paramount in all he does, and although in addition to the work already cited he produced busts of extraordinary excellence of Cyril Flower, John R. Clayton (since broken up by the artist—the fate of much of his admirable work), G. F. Watts, Sir Henry Tate, Sir George Birdwood, Sir Richard Owen, Sir George Grove and various others, it is on his goldsmithery that the artist would rest his reputation; on his mayoral chain for Preston, the epergne for Queen Victoria, the figures of "Victory" (a statuette designed for the great beauty, at once novel in treatment and fine in design, and as smaller objects such as seals, keys, and the like. Mr Gilbert was chosen associate of the Royal Academy in 1887, full member in 1892 (resigned 1900), and professor of sculpture (afterwards resigned) in 1900. In 1889 he won the Grand Prix at the Paris International Exhibition. He was created a member of the Victorian Order in 1897. (See Sculpture.)

GILBERT, ANN (1821-1904), American actress, was born at Rochdale, Lancashire, on the 21st of October 1821, her maiden name being Hartley. At fifteen she was a pupil at the hall connected with the Haymarket theatre, and in 1839 she was engaged by Paul Taglioni, and became a dancer on the stage. In 1846 she married George H. Gilbert (d. 1866), a performer in the company of which she was a member. Together they filled many engagements in English theatres, moving to America in 1849. Mrs Gilbert's first success in a speaking part was in 1857 as Wichavenda in Brougham's Pocahontas. In 1860 she joined Daly's company, playing for many years wives to James Lewis's husbands, and old women's parts, in which she had no equal. Mrs. Gilbert held an honoured position on the stage, and never lost account of the admiration, esteem and affection which she enjoyed both in front and behind the footlights. She died at Chicago on the 2nd of December 1904.

See Mrs Gilbert's Stage Reminiscences (1901).

GILBERT, GROVE KARL (1843— ), American geologist, was born at Rochester, N.Y., on the 6th of May 1843. In 1869 he was attached to the Geological Survey of Ohio and in 1879 became a member of the United States Geological Survey, being engaged on parts of the Rocky Mountains, in Nevada, Utah, California and Arizona. He is distinguished for his researches on mountain-structure and on the Great Lakes, as well as for his work on glacial phenomena, recent river movement, and on topographic features generally. His report on the Geology of the Henry Mountains (1877), in which the volcanic structure known as a laccolite was first described; his History of the Niagara River (1890) and Lake Bonneville (1891)—the first of the Monographs issued by the United States Geological Survey—are specially important. He was awarded the Wollaston medal by the Geological Society of London in 1900.

GILBERT, SIR HUMPHREY (c. 1539-1583), English soldier, navigator, and pioneer colonist in America, was the second son of Otho Gilbert of Cambridge, near Duxford, Devon, and stepbrother of Sir Walter Raleigh. He was educated at Eton and Oxford; intended for the law; introduced at court by Raleigh's aunt, Catherine Ashley, and appointed (July 1566) captain in the army of Ireland under Sir Henry Sidney. In April 1566 he had already joined with Anthony Jenkinson in a petition to Elizabeth for the discovery of the North-East Passage; in November following he presented an independent petition for the "discovering of a passage by the north to go to Catalonia." In October 1566 he became governor of Munster; on the 1st January 1570 he was knighted; in 1572 he was made member of the M.P. for Plymouth; in 1572 he campaigned in the Netherlands against Spain without much success; from 1573 to 1578 he lived in retirement at Limehouse, devoting himself especially to the advocacy of a North-West Passage (his famous Discourse on this subject was published in 1576). Gilbert's arguments, widely circulated even before 1575, were apparently of weight in promoting the Froebisher enterprises of 1576-1578. On the 11th of June 1578, Sir Humphrey obtained his long- coveted charter for North-Western discovery and colonization, authorizing him, his heirs and assigns, to discover, occupy and possess such remote "heathen lands not actually possessed of any Christian prince or people, as should seem good to him or them." Disposing not only of his patrimony but also of the estates in Kent which he had through his wife, daughter of John Aucher of Ollerton, he fitted out an expedition which left Dartmouth on the 23rd of September 1578, and returned in May 1579, having accomplished nothing. In 1579 Gilbert aided the government in Ireland; and in 1583, after many struggles, illustrated by his appeal to Raleigh in the 11th of July 1582, for the payment of moneys due to him from government, and by his agreement with the Southampton venturers—he succeeded in equipping another fleet for "Western Planting." On the 11th of June 1583, he sailed from Plymouth with five ships and the queen's blessing; on the 13th of July the "Ark Raleigh," built and manned at his brother's expense, deserted
the fleet; on the 30th of July he was off the north coast of Newfoundland; on the 3rd of August he arrived off the present St John's, and selected this site as the centre of his operations; on the 4th of August he began the plantation of the first English colony in North America. Proceeding southwards with three vessels exploring and prospecting he lost the large whale near cape Breton (29th of August); immediately after (31st of August) he started to return to England with the "Golden Hind" and the "Squirrel," of forty and ten tons respectively. Obstinate refusing to leave the "frigate" and sail in his "great ship," he shared the former's fate in a tempest off the Azores, 1st September, reports Hayes, the captain of the "Hind," "the frigate was near cast away, ... yet at that time recovered; and, giving forth signs of joy, the general, sitting abash with a book in his hand, cried out unto us in the 'Hind.' "We are as near to heaven by sea as by land. ... The same Monday night, about twelve, the frigate being ahead of us in the 'Golden Hind,' suddenly her lights were out, ... in that moment the frigate was devoured and swallowed up of the sea."

See Hakluyt, Principal Navigations (1590), vol. iii. pp. 135-181: Gilbert's Discourse of a Discovery for a New Passage to Cathay, published by George Gascoigne in 1576, which additions, probably without Gilbert's authority, Hood's An Improvement to Hakluyt's Irish Chronicle; Roger Williams, The Actions of the Low Countries (1618); State Papers, Domestic (1577-1583); Wood's Athenae Oxonienses, No. 457; Fox Bourne's English Steamen under the Tudors; Carlos Slater, Sir H. Gilbert and his Enterprise (Boston, 1903), with all important documents. Gilbert's interesting writings on the need of a university for London, anticipating in many ways the modern London University but also the British Museum library and its compulsory sustenance through the provisions of the Copyright Act, have been printed by Furnivall (Queen Elizabeth's Academys) in the Early English Text Society Publications, extra series, No. viii.

GILBERT, JOHN (1810-1889), American actor, whose real name was Gibbs, was born in Boston, Massachusetts, on the 27th of February 1810, and made his first appearance there as Jaffier in Venice Preserved. He soon found that his true vein was in comedy, particularly in old men parts. When in London in 1847 he was well received both by press and public, and played with Macready. He was the leading actor at Wallack's from 1861-1888. He died on the 17th of June 1889. See William Winter's Life of John Gilbert (New York, 1890).

GILBERT, SIR JOHN (1817-1897), English painter and illustrator, one of the eight children of George Felix Gilbert, a London solicitor, he was born at his father's house in the 21st of July 1817. He went to school there, and even in childhood displayed an extraordinary fondness for drawing and painting. Nevertheless, his father's lack of means compelled him to accept employment for the boy in the office of Messrs Dickson & Bell, estate agents, in Charlotte Row, London. Yielding, however, to his natural bent, his parents agreed that he should take up art in his own way, which included but little advice from others, his only teacher being Haydon's pupil, George Lance, the fruit painter. This artist gave him brief instructions in the use of colour. In 1836 Gilbert appeared in public for the first time. This was at the gallery of the Society of British Artists, where he sent drawings, the subjects of which were characteristic, being "The Arrest of Lord Hastings," from Shakespeare, and "Abbot Boniface," from The Monastery of Scott. "Inez de Castro" was in the same gallery in the next year; it was the first of a long series of works in the same medium, representing similar themes, and was accompanied, from 1837, by a still greater number of works in oil; all were exhibited at the British Institution. These included "Don Quixote giving advice to Sancho Panza," 1834; "Brunnette and Phillis," from The Spectator, 1844; "The King's Artillery at Marston Moor," 1860; and "Don Quixote comes back for the last time to his Home and Family," 1867. In that year the Institution was finally closed. Gilbert exhibited at the Royal Academy from 1838, beginning with the "Portrait of a Gentleman," and continuing, except between 1851 and 1867, till his death to exhibit there many of his best and more ambitious works. These included such capital instances as "Holbein painting the Portrait of Anne Boleyn," "Don Quixote's first Interview with the Duke and Duchess," 1842, "Charlemagne visiting the Schools," 1846. "Touchstone and the Shepherd," and "Rembrandt," a very fine piece, were both there in 1867; and in 1873 "Naseby," one of his finest and most picturesque scenes, was also at the Royal Academy. Gilbert was elected A.R.A. 29th January 1872, and R.A. 29th June 1876. Besides these mostly large and powerful works, the artist's true arena of display was undoubtedly the gallery of the Old Water Colour Society, to which from 1853, when he was elected an Associate exhibitor, till he died forty-five years later, he contributed not fewer than 270 drawings, most of them admirable because of the largeness of their style, massive coloration, broad chiaroscuro, and the surpassing vigour of their designs. These qualities led the leading critics to claim for him opportunities for painting mural pictures of great historic themes as decorations of national buildings. "The Trumpeter," "The Standard-Bearer," "Richard II. resigning his Crown" (now at Liverpool), "The Drug Bazaar at Constantinople," "The Merchant of Venice" and "The Turkish Water-Carrier" are but examples of that wealth of art which added to the attractions of the gallery in Pall Mall. There Gilbert was elected a Full Member in 1855, and president of the Society in 1871, shortly after which he was knighted. As an illustrator of books, magazines and periodicals of every kind he was most prolific. To the success of the Illustrated London News his designs lent potent aid, and he was eminently serviceable in illustrating the Shakespeare of Mr Howard Staunton. He died on the 6th of October 1897.

(G.F.S.)

GILBERT, SIR JOSEPH HENRY (1817-1901), English chemist, was born at Hull on the 1st of August 1817. He studied chemistry first at Glasgow under Thomas Thomson; then at University College, London, in the laboratory of A. T. Thomson (1798-1849), the professor of medical jurisprudence, also attending Thomas Graham's lectures; and finally at Giessen under Liebig. On his return to England he acted for a year or so as assistant to his old master A. T. Thomson at University College, and in 1843, after spending a short time in the study of calico dyeing and printing near Manchester, accepted the directorship of the chemical laboratory at the famous experimental station established by Sir J. B. Lawes at Rothamsted, near St Albans, for the systematic and scientific study of agriculture. This position he held for fifty-eight years, being still in office at his death on 24th December 1893, and he carried out during that long period in collaboration with Lawes was of a most comprehensive character, involving the application of many branches of science, such as chemistry, meteorology, botany, animal and vegetable physiology, and geology; and its influence in improving the methods of practical agriculture extended all over the civilized world. Gilbert was chosen a fellow of the Royal Society in 1860, and in 1867 was awarded a royal medal jointly with Lawes. In 1880 he presided over the Chemical Section of the British Association at its meeting at Swansea, and in 1882 he was president of the London Chemical Society, of which he had been a member almost from its foundation in 1841. For six years from 1884 he filled the Slithropian chair of rural economy at Oxford, and he was also an honorary professor at the Royal Agricultural College, Cirencester. He was knighted in 1893, the year in which the jubilee of the Rothamsted experiments was celebrated.

GILBERT, MARIE DOLORES ELIZA ROSANNA ["La Montez"] (1818-1861), dancer and adventurer, was the daughter of a British army officer, was born at Limerick, Ireland, in 1818. Her father dying in India when she was seven years old, and her mother marrying again, the child was sent to Europe to be educated, subsequently joining her mother at Bath. In 1837 she made a runaway match with a Captain James of the Indian army, and accompanied him to India. In 1842 she returned to England, and shortly afterwards her husband obtained a decree nisi for divorce. She then studied dancing, making an unsuccessful first appearance at Her Majesty's theatre, London, in 1843, billed as "Lola Montez, Spanish dancer." Subsequently
she appeared with considerable success in Germany, Poland and Russia. Thence she went to Paris, and in 1847 appeared at Munich, where she became the mistress of the old king of Bavaria, Ludwig I; she was naturalized, created comtesse de Landsfeld, and given an income of £2000 a year. She soon proved herself the real ruler of Bavaria, adopting a liberal and anti-Jesuit policy. Her political opponents proved, however, too strong for her, and in 1848 she was banished. In 1849 she came to England, and in the same year was married to George Heald, a young officer in the Guards. Her husband's guardian instituted a prosecution for bigamy against her, and he found that her divorce from Captain James had not been made absolute, and she fled with Heald to Spain. In 1853 she appeared at the Broadway theatre, New York, and in the following year at the Walnut Street theatre, Philadelphia. In 1853 Heald was drowned at Lisbon, and in the same year she married the proprietor of a San Francisco newspaper, but did not live long with him. Subsequently she appeared in Australia, but returned, in 1857, to act in America, and to lecture on galvanity. Her health having broken down, she devoted the rest of her life to visiting the Mostoffs of her own sex in New York, where, stricken with paralysis, she died on the 17th of January 1861.

See E. B. D'Auvergne, Lala Montes (New York, 1899).

GILBERT, NICOLAS JOSEPH LAURENT (1751-1780), French poet, was born at Fontenay-le-Château in Lorraine in 1751. Having completed his education at the college of Dôle, he devoted himself for a time to a half-scholastic, half-literary life at Nancy, but in 1774 he found his way to the capital. As an opponent of the Encyclopédistes and a panegyrist of Louis XV, he received considerable pensions. He died in Paris on the 11th of November 1780 from the results of a fall from his horse. The satiric force of one or two of his pieces, as Mon Apologie (1778) and Le Dis-huitième Sïcle (1775), would alone be sufficient to preserve his reputation, which has been further increased by modern writers, who, like Alfred de Vigny in his Stello (chaps. 7-13), considered him a victim to the spite of his philosophic opponents. His best-known verses are the Ode imitée de plusieurs poèmes, usually entitled Adieu à la vie. Among his other works may be mentioned Les Familles de Daris et d'Éridane, histoire persane (1770), Le Carnaval des auteurs (1773), Odes nouvelles et patriotiques (1775). Gilbert's Œuvres complètes were first published in 1788, and they have since been edited by A. Delalande (Paris, 1823), by Charles Nodier (1817 or 1822), and by M. de Lescure (1882).

GILBERT (or Gilberde), WILLIAM (1544-1603), the most distinguished man of science in England during the reign of Queen Elizabeth, and the father of electric and magnetic science, was a member of an ancient Suffolk family, long resident in Clare, and was born on the 24th of May 1544 at Colchester, where his father, Hierome Gilbert, became rector. Educated at Colchester school, he entered St John's College, Cambridge, in 1558, and after taking the degrees of B.A. and M.A. in due course, graduated M.D. in 1569, in which year he was elected a senior fellow of his college. Soon afterwards he left Cambridge, and after spending three years in Italy and other parts of Europe, settled in 1573 in London, where he practised as a physician with "great success and applause." He was admitted to the College of Physicians probably about 1576, and from 1581 to 1590 was one of the censors. In 1587 he became treasurer, holding the office till 1591, and in 1589 he was one of the committee appointed to superintend and suppress the printing of the Placita Scotiana Lokmentis, which the college in that year decided to issue, but which did not actually appear till 1618. In 1597 he was again chosen treasurer, becoming at the same time consiliarius, and in 1598 he succeeded to the presidency. Two years later he was appointed physician to Queen Elizabeth, with the usual emolument of £100 a year. After this time he seems to have removed to the court, vacating his residence, Wingfield House, which was on Peter's Hill, between Upper Thames Street and Little Knightsbridge Street, and afterwards was sold by the College. On the accession of the queen in 1593 he was reappointed by her successor; but he did not long enjoy the honour, for he died, probably of the plague, on the 30th of November (10th of December, N.S.) 1603, either in London or in Colchester. He was buried in the latter town, in the chancel of Holy Trinity church, where a monument was erected to his memory. To the College of Physicians he left his books, globes, instruments and minerals, but they were destroyed in the great fire of London.

Gilbert's principal work is his treatise on magnetism, entitled De magnete, magnetisico corpusculibus, et de magnis magnete tellure (London, 1600; later editions—Stettin, 1628, 1633; Frankfurt, 1639, 1639). This work, which embodied the results of many years' research, was distinguished by its strict adherence to the scientific method of investigation by experiment, and by the originality of its matter, containing, as it does, an account of the author's experiments on magnets and magnetic bodies and on electrical attractions, and also his great conception that the earth is nothing but a large magnet, and that it is this which explains, not only the direction of the magnetic needle north and south, but also the variation and dipping or inclination of the needle. Gilbert's is therefore not merely the first, but the most important, systematic contribution to the sciences of electricity and magnetism. A posthumous work of Gilbert's was edited by his brother, also named William, from two MSS. In the possession of Sir William Boswell; its title is De mundo nostro sublunari philosophia nova (Amsterdam, 1651). He is the reputed inventor besides of two instruments to enable sailors "to find out the latitude without seeing of sun, moon or stars," an account of which is given in Thomas Bloudeville's Théoriques of the Planets (London, 1662). He was also the first advocate of Copernican views in England, and he concluded that the fixed stars are not all at the same distance from the earth.

It is a matter of great regret for the historian of chemistry that Gilbert left nothing on that branch of science, to which he was deeply devoted, "attaining to great exactness therein." So at least says Thomas Fuller, who in his Worthies of England propounded truly how he would be afterwards known: "Mahomet's tomb at Mecca," he says, "is said strangely to hang up, attracted by some invisible loadstone; but the memory of this doctor will never fail to the ground, which his incomparable book De magnete will support to eternity."

An English translation of the De magnete was published by P. F. Moxetleay in 1685, and another, with notes by S. P. Thompson, was issued by the Gilbert Club of London in 1900.

GILBERT, SIR WILLIAM SCHWENK (1836- ), English playwright and humorist, son of William Gilbert (a descendant of Sir Humphrey Gilbert), was born in London on the 18th of November 1836. His father was the author of a number of novels, the best-known of which were Shirley Hall Asylum (1863) and Dr Austin's Guests (1866). Several of these novels—which were characterized by a singular acuteness and lucidity of style, by a dry, subacid humour, by a fund of humanitarian feeling and by a considerable medical knowledge, especially in regard to the psychology of lunatics and monomaniacs—were illustrated by his son, who developed a talent for whimsical dramaticism. W. S. Gilbert was educated at Boulogne, at Ealing and at King's College, graduating B.A. from the university of London in 1856. The termination of the Crimean War was fatal to his project of competing for a commission in the Royal Artillery, but he obtained a post in the education department of the privy council office (1857-1861). Disliking the routine work, he left the Civil Service, entered the Inner Temple, was called to the bar in November 1864, and joined the northern circuit. His practice was inconsiderable, and his military and legal ambitions were eventually satisfied by a captaincy in the volunteers and appointment as a magistrate for Middlesex (June 1891). In 1861 the comic journal Fun was started by H. J. Byron, and Gilbert became from the first a valued contributor. Failing to obtain an entrée to Punch, he continued sending excellent comic verse to Fun, with humorous illustrations, the work of his own pen, over the signature of "Bab." A collection of these lyrics, in which he often illustrated a timehonored untruth with a satirical experience, the deceptiveness of appearances with the irresistible nonsense of a Lewis Carroll, was issued separately in 1865 under the title of Bab Ballads, and was followed by More Bab Ballads. The
GILBERT DE LA PORRÉE

two collections and Songs of a Savoyard were united in a volume issued in 1868, with many new illustrations. The best of the old cuts, such as those depicting the “Bishop of Rum-ti-Foo” and the “Discontented Sugar Broker,” were preserved intact.

While remaining a staunch supporter of Fun, Gilbert was soon immersed in other journalistic work, and his position as dramatic critic to the Illustrated Times turned his attention to the stage. He had not to wait long for an opportunity. Early in December 1886 T. W. Robertson was engaged by Mrs. Hunter (or A. M. James)’s theatre, to find some one who could turn out a bright Christmas piece in a fortnight, and suggested Gilbert; the latter promptly produced Dulcamara, a burlesque of L’Elisir d’amore, written in ten days, rehearsed in a week, and duly performed at Christmas. He sold the piece outright for £30, a piece of rashness which he had cause to regret, for it turned out a commercial success. In 1870 he was commissioned by Buckstone to write a blank verse fairy comedy, based upon Le Palais de la sérénité, the novel by Madame de Genlis. The result was The Palace of Truth, a fairy drama, poor in structure but clever in workmanship, which served the purpose of Mr and Mrs Kendal in 1870 at the Haymarket. This was followed in 1871 by Pygmalion and Galatea, another three-act “mythological comedy,” a clever and effective but artificial piece. Another fairy comedy, The Wicked World, written for Buckstone and the Kendals, was followed in March 1873 by a burlesque version, in collaboration with Gilbert à Beckett, entitled The Happy Land. Gilbert’s next dramatic ventures inclined more to the conventional pattern, combining sentiment and a cynical humour in a manner strongly reminiscent of his father’s style. Of these pieces, Sweethearts was given at the Prince of Wales’s theatre, 7th November 1874; Tom Cobb at the St James’s, 24th April 1875; Broken Hearts at the Court, 9th December 1875; Don’t Druce (a drama in darker vein, suggested to some extent by Silas Marner) at the Haymarket, 11th September 1876; and Engaged at the Haymarket, 3rd October 1877. The first and last of these proved decidedly popular. Gretchen, a verse drama in four acts, appeared in 1879. A one-act piece, called Comedy and Tragedy, was produced at the Lyceum, 26th January, 1884.

Two dramatic trios of later date were Foggerty’s Fairy and Rosenbrants and Goldenstein, a travesty of Hamlet, performed at the Vaudeville in June 1881. Several of these dramas were based upon short stories by Gilbert, a number of which had appeared from time to time in the Christmas numbers of various periodicals. The best of them have been collected in the volume entitled Foggerty’s Fairy, and other Stories. In the autumn of 1871 Gilbert commenced his memorable collaboration (which lasted over twenty years) with Sir Arthur Sullivan. The first two comic operas, Thespis; or Thespis; or The Comic Ode (26th September 1871) and Trial by Jury (Royalty, 25th March 1875) were merely essays. Like one or two of their successors, they were, as regards plot, little more than extended “Bab Ballads.” Later (especially in the Yeomen of the Guard), much more elaboration was attempted. The next piece was produced at the Opera Comique (17th November 1877) as The Sorcerer. At the same theatre were successfully given H.M.S. Pinafore (23rd May 1878), The Pirates of Penzance; or The Slave of Duty (3rd April 1879), The Mikado; or The Town of Titipu (14th March 1885); Ruddigore (22nd January 1887); The Yeomen of the Guard (3rd October 1888); and The Gondoliers (7th December 1889). After the appearance of The Gondoliers a coolness occurred between the composer and librettist, owing to Gilbert’s considering that Sullivan had not supported him in a business disagreement with D’Oyly Carte. But the estrangement was only temporary. Gilbert wrote several more librettos, and of these Utopia Limited (1893) and the exceptionally witty Grand Duke (1896) were written in conjunction with Sullivan. As a master of metre Gilbert had shown himself consummate, as a dealer in quips and paradoxes and ludicrous dilemmas, unrivalled. Even for the music of the operas he deserves some credit, for the rhythms were frequently his own (as in “I have a little daughter”) and theaccidents of the tunes invented by himself. One or two of his librettos, such as that of Patience, are virtually flawless. Enthusiasts are divided only as to the comparative merit of the operas. Princess Ida and Patience are in some respects the daintiest. There is a genuine vein of poetry in The Yeomen of the Guard. Some of the drollest songs are in Pinafore and Ruddigore. The Gondoliers shows the most charming lightness of touch, while with the general public The Mikado proved the favourite. The enduring popularity of the Gilbert and Sullivan operas was abundantly proved by later revivals. Among the birthday honours in June 1907 Gilbert was given a knighthood. In 1909 his Fallen Fairies (music by Edward German) was produced at the Savoy.

GILBERT DE LA PORRÉE, frequently known as Gilbertus Porretanus or Pictaviensis (1790–1914), scholastic logician and theologian, was born at Poitiers. He was educated under Bernard of Chartres and Anselm of Laon. After teaching for about twenty years in Chartres, he lectured on dialectics and theology in Paris (from 1137), and in 1141 returned to Poitiers, being elected bishop in the following year. His heterodox opinions regarding the doctrine of the Trinity drew upon him works the condemnation of the church. The synod of Reims in 1148 procured papal sanction for four propositions opposed to certain of Gilbert’s tenets, and his works were condemned until they should be corrected in accordance with the principles of the church. Gilbert seems to have submitted quietly to this judgment; he yielded assent to the four propositions, and remained on friendly terms with his antagonists till his death on the 4th of September 1154. Gilbert is almost the only logician of the 12th century who is quoted by the greater scholastics of the succeeding age. His chief logical work, the treatise De sex principiis, was regarded with a reverence almost equal to that paid to Aristotle, and furnished matter for numerous commentators, amongst them Albertus Magnus. Owing to the fame of this work, he is mentioned by Dante as the Magister sex principiorum. The treatise itself is a discussion of the Aristotelian categories, specially of the six subordinate modes. Gilbert distinguishes in the ten categories two classes, one essential, the other derivative. Essential or inhering (formae substantiales) in the objects themselves are only substance, quantity, and quality, and relation in the stricter sense of that term. The remaining six, when, where, action, position and habit, are relative and subordinate (formae assistentes). This suggestion has some interest, but is of no great value, either in logic or in the theory of knowledge. More important in the history of scholasticism are the theological consequences to which Gilbert’s realism led him. In the commentary on the treatise De Trinitate (erroneously attributed to Boëthus) he proceeds from the assumption that the members of the trinity (accompanied by a detail notice) were Atonal or abstract, in response to a category to which that is. This pure being is God, and must be distinguished from the triune God as known to us. God is incomprehensible, and the categories cannot be applied to determine his existence. In God there is no distinction or difference, whereas in all substances or things there is duality, arising from the element of matter. Between pure being and substances stand the ideas or forms, which subsist, though they are not substances. These forms, when materialized, are called formae substantiales or formae substantiae; they are the essences of things, and in themselves have no relation to the accidents of things. They are temporal, the ideas perpetual, God eternal. The pure form of existence, that by which God is God, must be distinguished from the three persons who are God by participation in this form. The form or essence is one, the persons or substances three. It was this distinction between Deitas or
Divinitas and Deus that led to the condemnation of Gilbert’s doctrine.

De sex principii and commentary on the De Trinitate in Migne, Patrologia Latina, lxxv, 1255 and xxivviii, 1257. See also Abel Berthaud, Gilbert de la Porte (Poitiers, 1862); B. Hauderat, De la philosophie scolastique, pp. 294-318; R. Schmid’s article “Gilbert Porreutius” in Hefgo-Hauck, Realencyc. J. Th. Triller, 1894; Prattl; Geschichte der Logik, ii. 215; Bach, Dogmengeschichte, ii. 133; article SCHOLASTICISM.

GILBERT OF SEMPRINGHAM, ST., founder of the Gilbertines, the only religious order of English origin, was born at Sempringham in Lincolnshire, c. 1083-1089. He was educated in France, and ordained in 1125, being presented by his father to the living of Sempringham. About 1135 he established there a convent for nuns; and to perform the heavy work and cultivate the fields, he formed a number of labourers into a society of lay brothers attached to the convent. Similar establishments were founded elsewhere, and in 1147 Gilbert tried to get them incorporated in the Cistercian order. Failing in this, he proceeded to form communities of priests and clerics to perform the spiritual ministrations needed by the nuns. The women lived according to the Benedictine rule as interpreted by the Cistercians; the men according to the rule of St. Augustine, and were canons regular. The special constitutions of the order were largely taken from the Premonstratensian canons of the Cistercians. Like Fontevrault (q.v.), it was a double order, the communities of men and women living side by side; but, though the property all belonged to the nuns, the superior of the canons was the head of the whole establishment, and the general superior was a canon, called “Master of Sempringham.” The general chapter was a mixed assembly composed of two canons and two nuns from each house; the nuns had to travel to the chapter in closed carts. The office was celebrated together in the church, a high stone screen separating the two choirs of canons and nuns. The order received papal approbation in 1148. By Gilbert’s death (1189) there were nine double monasteries and four of canons only, containing about 700 canons and 1000 nuns in all. At the dissolution there were some 25 monasteries, whereof 4 ranked among the greater monasteries (see list in F. A. Gasquet’s English Monastic Life). The order never spread beyond England.

The habit of the Gilbertines was black, with a white cloak.

See Bollandists’ Acta Sanctorum (4th of Feb.); William Dugdale, Monasticon (1846); Helyot, Hist. des ordres religieux (1714), ii. c. 29. The best modern account is St Gilbert of Sempringham, and the Gilbertines, by Rose Graham (1901). The art. in Dictionary of National Biography gives abundant information on St Gilbert, but is unsatisfactory on the order, as it might easily convey the impression that the canons and nuns lived together, whereas they were most of the time living side by side and altogether under a single head. Miss Graham declares that the reputation of the order was good until the end.

GILBERT FOLIOT (d. 1187), bishop of Hereford, and of London, is first mentioned as a monk of Cluny, whence he was called in 1136 to plead the cause of the empress Matilda against Stephen at the Roman court. Shortly afterwards he became prior of Cluny; then prior of Abbéville, a house dependent upon Cluny. In 1139 he was elected abbot of Gloucester. The appointment was confirmed by Stephen, and from the ecclesiastical point of view was unexceptional. But the new abbot proved himself a valuable ally of the empress, and her ablest controversialist. Gilbert’s reputation grew rapidly. He was respected at Rome; and he acted as the representative of the primate, Theobald, in the supervision of the Welsh church. In 1148, on being nominated by the pope to the see of Hereford, Gilbert was urged to accept the nomination both from Henry of Anjou and from Stephen. But he was an Angevin at heart, and after 1154 was treated by Henry II. with every mark of consideration. He was Becket’s rival for the primacy, and the only bishop who protested against the king’s choice. Becket, with rare forbearance, endeavoured to win his friendship by procuring for him the see of London (1165). But Gilbert evaded the customary profession of obedience to the primate, and apparently aspired to make his see independent of Canterbury. On the questions raised by the Constitutions of Clarendon he sided with the king, whose confessor he had now become. He urged Becket to yield, and, when this advice was rejected, encouraged his fellow-bishops to repudiate the authority of the archbishop. In the years of controversy which followed Becket’s flight the king depended much upon the bishop’s skill as a disputant and diplomatist. Gilbert was twice excommunicated by Becket, but both on these and on other occasions he showed great dexterity in detaching the pope from the cause of the exile. To him it was chiefly due that Henry avoided an open conflict with Rome of the kind which John afterwards provoked. Gilbert was one of the bishops whose excommunication in 1170 provoked the king’s knights to murder Becket; but he cannot be reproached with any share in the crime. His later years were uneventful, though he enjoyed great influence with the king and among his fellow-bishops. Gilbert died, ascetic in his private life, devoted to the service of the Church, he was nevertheless more respected than loved. His nature was cold; he made few friends; and the taint of a calculating ambition runs through his whole career. He died in the spring of 1187.

GILBERT (KINGSMILL) ISLANDS, an extensive archipelago belonging to Great Britain in the mid-western Pacific Ocean, lying in n. S. of the equator, and between 170° and 180° E. There are sixteen islands, all coral reefs or atolls, extending in crescent form over about five degrees of latitude. The principal is Taputenea or Drummond Island. The soil, mostly of coral sand, is productive of little else than the coco-nut palm, and the chief source of food supply is the sea. The population of these islands presents a remarkable phenomenon; in spite of adverse conditions of environment and complete barbarism it is exceedingly dense, in strong contradistinction to that of many other more favoured islands. The land area of the group is only 166 m., yet the population is about 30,000. The Gilbert islanders are a dark and coarse type of the Polynesian race, and show signs of much crossing. They are tall and stout, with an average height of 5 ft. 8 in., and are of a vigorous, energetic temperament. They are nearly always naked, but wear a conical hat of pandanus leaf. In war they have an armour of plaited coco-nut fibres. They are fierce fighters, their chief weapon being a sword armed with sharks’ teeth. Their canoes are well made of coco-nut wood and are fastened on frames. British and American missionary work has been prosecuted with some success. The large population led to the introduction of natives from these islands into Hawaii as labourers in 1878-1884, but they were not found satisfactory. The islands were discovered by John Byron in 1765 (one of them bearing his name); Captains Gilbert and Marshall visited them in 1788; and they were annexed by Great Britain in 1892.

GILBEY, SIR WALTER, 1ST BART. (1831— ). English wine-merchant, was born at Bishop Stortford, Hertfordshire, in 1831. His father, the owner and frequently the driver of the daily coach between Bishop Stortford and London, died when he was eleven years old, and young Gilbey was shortly afterwards placed in the office of an estate agent at Tring, subsequently obtaining a clerkship in a firm of parliamentary agents in London. On the outbreak of the Crimean War, Walter Gilbey and his younger brother, Alfred, volunteered for civilian service at the front, and were employed at a convalescent hospital on the Dardanelles. Returning to London on the declaration of peace, Walter and Alfred Gilbey, on the advice of their eldest brother, Henry Gilbey, a wholesale wine-merchant, started in the retail wine and spirit trade. The heavy duty then levied by the British government on French, Portuguese and Spanish wines was prohibitive of a sale among the English middle classes, and especially lower middle classes, whose usual alcoholic beverage was accordingly beer. Henry Gilbey was of opinion that these classes would gladly drink wine if they could get it at a moderate price, and by his advice Walter and Alfred determined to push the sales of colonial, and particularly of Cape, wines, on which
the duty was comparatively light. Backed by capital obtained through Henry Gilbey, they accordingly opened in 1857 a small retail business in the Strand and Soho, in London. Later, Cape wines proved popular, and within three years the brothers had 20,000 customers on their books. The creation of the off-licence system by Mr Gladstone, then chancellor of the exchequer, in 1860, followed by the large reduction in the duty on French wines effected by the commercial treaty between England and France in 1864, revolutionized their trade and laid the foundation of their fortunes. Three provincial grocers, who had been granted the new off-licence, applied to be appointed the Gilbey's agents in their respective districts, and similar applications followed. These were granted, and before very long a leading local grocer was acting as the firm's agents in every district in England. The grocer who dealt in the Gilbey's wines and spirits was not allowed to sell those of any other firm, and the Gilbeys in return handed over to him all their existing customers in his district. This arrangement was of mutual advantage, and the Gilbey's business increased so rapidly that in 1864 Henry Gilbey abandoned his own undertaking and joined his brothers. In 1867 the three brothers secured the lease of the old Pantheon theatre and concert hall in Oxford Street for their headquarters. In 1875 the firm purchased a large claret-producing estate in Médoc, on the banks of the Gironde, and became also the proprietors of two large whisky-distilleries in Scotland. In 1893 the business was converted, for family reasons, into a private limited liability company, of which Walter Gilbey, who in the same year was created a baronet, was chairman. Sir Walter Gilbey also became well known as a breeder of shire horses, and he did much to improve the breed of English horses (other than race-horses generally), and wrote extensively on the subject. He became president of the Shire Horse Society, of the Hackney Horse Society, and of the Hunters' Improvement Society, and he was the founder and chairman of the London Cart Horse Parade Society. He was also a practical agriculturalist, and president of the Royal Agricultural Society.

GILDAS, or GILDUS (c. 516-570), the earliest of British historians (see CELT: Literature, "Welsh"), surnamed by some Sapins, and by others Badonius, seems to have been born in the year 516. Regarding him little certain is known, beyond some isolated particulars that may be gathered from hints dropped in the course of his work. Two short treatises exist, purporting to be lives of Gildas, and ascribed respectively to the 11th and 12th centuries; but the writers of both are believed to have confounded two, if not more, persons that had borne the name. It is from an incidental remark of his own, namely, that the year of the siege of Mount Badon—one of the battles fought between the Saxons and the Britons—was also the year of his own nativity, that the date of his birth has been derived; the place, however, is not mentioned. His assertion that he was moved to undertake his task mainly by "zeal for God's house and for His holy law," and the very free use he has made of quotations from the Bible, leave scarcely a doubt that he was an ecclesiastic of some order or other. In addition, we learn that he went abroad, probably to France, in his thirty-fourth year, where, after 10 years of hesitation and preparation, he composed, about 560, the work bearing his name. His materials, he tells us, were collected from foreign rather than native sources, the latter of which had been put beyond his reach by circumstances. The Cambrian Annals give 570 as the year of his death.

The writings of Gildas have come down to us under the title of Gildus Sapiens de excidio Britanniae liber quaterus. Though at first written consecutively, the work is now usually divided into three portions,—a preface, the history proper, and an epistle,—the last, which is largely made up of passages and texts of Scripture brought together for the purpose of condemning the vices of his countrymen and their rulers, being the least important, though by far the longest of the three. In the second he passes in brief review the history of Britain from its invasion by the Britons and Saxons in the time of their first king, Cadwallon, and in Oxford for the first time; the persecution under Diocletian; the spread of the Arian heresy; the election of Maximus as emperor by the legions in Britain, and his subsequent death at Aquileia; the invasions of the Saxons in the south, and Scots and Picts in the north; the temporary assistance rendered to the harassed Britons by the Romans; the final abandonment of the island by the latter; the coming of the Saxons and their reception by Guortigern (Vortigern); and, finally, the conflicts between the Britons, led by a noble Roman, Ambrosius Aurelianus, and the new invaders. Unfortunately, on almost every point on which he touches, the statements of Gildas are vague and obscure. With one exception already alluded to, no dates are given, and events are not always taken up in the order of their occurrence. These faults are often of importance, and may be on occasion of great use to the writers notice the affairs of Britain; but they become more serious when, as is the case from nearly the beginning of the 5th century to the date of his death, Gildas's brief narrative is our only authority for most of what passes current as the history of our island during those years. Thus it is on his sole, though in this instance perhaps trustworthy, testimony that the famous letter rests, said to have been sent to Rome in 446 by the despairing Britons, commencing:—To Agitius (Aetius), consul for the third time, the governor of the Britons.

Gildas's treatise was first published in 1525 by Polydore Vergil, but with many altered alterations and omissions. In 1568 John Josseline, secretary to Archbishop Parker, issued a new edition of it more in conformity with manuscripts, and a still more carefully revised edition appeared at Oxford by Thomas Gale. It was frequently reprinted on the Continent during the 16th century, and once in office since. The next English edition, denounced by Porson, was edited by Schwinn, for the English Historical Society in 1836, and edited by the Rev. J. Steven son. The text of Gildas founded on Gale's edition collated with two other MSS., with elaborate introductions, is included in the Monumenta historica Britanniae, edited by Petrie and Sharpe (London, 1848). Another edition is in A. W. Haddon and W. Stubbs, Councils and Ecclesiastical Documents relating to Great Britain (Oxford, 1869); the latest edition is that by Theodore Thomson in Monumenta Germ. hist. auct. antiqu. xiii. (Chronica min. ill.), 1894.

GILDER, RICHARD WATSON (1844-1900), American editor and poet, was born in Bordentown, New Jersey, on the 8th of February 1844, a brother of William Henry Gilder (1838-1900), the Arctic explorer. He was educated at Bellevue Seminary, an institution conducted by his father, the Rev. William Henry Gilder (1812-1864), in Flushing, Long Island. After three years (1865-1868) on the Newark, New Jersey, Daily Advertiser, he founded, with Newton Crane, the Newark Morning Register. In 1860 he became editor of Hours at Home, and in 1870 assistant editor of Scribner's Monthly (eleven years later re-named The Century Magazine), of which he became editor in 1881. He was one of the founders of the Free Art League, of the International Copyright League, and of the Authors' Club; was chairman of the New York Tenement House Commission in 1894; and was a prominent member of the National Institute of Arts and Letters, of the Council of the National Civil Service Reform League, and of the executive committee of the Citizens' Union of New York City. His poems, which are essentially lyrical, have been collected in various volumes, including Five Books of Song (1864), In Palestine and other Poems (1898), Poems and Inscriptions (1901), and In the Heights (1905). A complete edition of his poems was published in 1898. He also edited "Sonnets from the Portuguese" and other Poems by Elizabeth Barrett Browning; "One Word More" and other Poems by Robert Browning (1905). He died in New York on the 18th of November 1900. His wife, Helena de Kay, a grand-daughter of Joseph Rodman Drake, assisted, with Saint Gaudens and others, in founding the Society of American Artists, now merged in the National Academy, and the Art Students' League of New York. She translated Senier's biography of Millet, and painted, before her marriage in 1874, studies in flowers and ideal heads, much admired for their feeling and delicate colouring.

GILDERSLEEVE, BASIL LANNAE (1831-1905), American classical scholar, was born in Charleston, South Carolina, on the 18th of September 1831. A son of the Rev. Gilbert M. Gildersleeve, a Presbyterian evangelist, and editor of the Charleston Christian Observer in 1826-1845, of the Richmond (Va.) Watchman and
Gilding

Observer in 1845–1856, and of The Central Presbyterian in 1856–1860. The son graduated at Princeton in 1849, studied under Franz in Berlin, under Friedrich Ritschl at Bonn and under Schneidewin in Göttingen, where he received his doctor's degree in 1853. From 1856 to 1876 he was professor of Greek in the University of Virginia, holding the chair of Latin also in 1862–1866 and in 1868. Returning to Greece in 1866 he became one of the first to found Johns Hopkins University. In 1880 The American Journal of Philology, a quarterly published by the Johns Hopkins University, was established under his editorial charge, and his strong personality was expressed in the department of the Journal headed "Brief Report" or "Lanx Saturn," and in the earliest years of its publication every petty detail was in his hands. His style in it, as elsewhere, is in striking contrast to that of the typical classical scholar, and accords with his conviction that the true aim of scholarship is "that which is." He published a Latin Grammar (1867; revised with the co-operation of Gonzalez B. Lodge, 1894 and 1899) and a Latin Series for use in secondary schools (1875), both marked by lucidity of order and mastery of grammatical theory and methods. His edition of Persius (1875) is of great value. But his bent was rather toward Greek than Latin. His special interest in Christian Greek was partly the cause of his editing in 1877 The Apologies of Justin Martyr, "which" (to use his own words) "I used unhesitatingly as a repository for my syntactical formulae." Gildersleeve's studies under Franz had no doubt quickened his interest in Greek syntax, and his logic, untrammelled by previous categories, and his marvellous sympathy with the language were displayed in this most unlikely of places. His Syntax of Classical Greek (Part I., 1900, with C. W. E. Miller) collects these formulae. Gildersleeve edited in 1885 The Olympian and Pythian Odes of Pindar, with a brilliant and valuable introduction. His views on the function of grammar were summarized in a paper on The Spiritual Rights of Minute Research delivered at Bryn Mawr on the 16th of June 1895. His collected contributions to literary periodicals appeared in 1913 under the title Essays and Studies Educational and Literary.

Gilding, the art of spreading gold, whether by mechanical or by chemical means, over the surface of a body for the purpose of ornament. The art of gilding was known to the ancients. According to Herodotus, the Egyptians were accustomed to gild wood and metals; and gilding by means of gold plates is frequently mentioned in the Old Testament. Pliny informs us that the first gilding seen at Rome was after the destruction of Carthage, under the censorship of Lucius Mummius, when the Romans laid gild the ceilings of their temples and palaces, the Capitol being the first place on which this enrichment was bestowed. But he adds that luxury advanced on them so rapidly that in a little time you might see all, even private and poor persons, glide the walls, vaults, and other parts of their dwellings. Owing to the comparative thickness of the gold-leaf used in ancient gilding, the traces of it which yet remain are remarkably brilliant and solid. Gilding has in all times occupied an important place in the ornamental arts of Oriental countries; and the native processes pursued in India at the present day may be taken as typical of the arts as practised from the earliest periods. For the gilding of copper, employed in the decoration of temple domes and other large works, the following is an outline of the processes employed. The metal surface is thoroughly scraped, cleaned, and polished, and then heated in a fire sufficiently to remove any traces of grease or other impurity which may remain from the operation of polishing. It is then dipped in an acid solution prepared from dried unripe apricots, and rubbed with pumice or brick powder. Next, the surface is rubbed over with mercury which forms a superficial amalgam with the copper, after which it is left some hours in cold water, again washed with the acid solution, and dried. It is now ready for receiving the gold, which is laid on in leaf, and, on adhering, assumes a grey appearance from combining with the mercury, but on the application of heat the latter metal volatilizes, leaving the gold a dull greyish hue. The colour is brought up by means of rubbing with agate burnishers. The weight of mercury used in this process is double that of the gold laid on, and the thickness of the gilding is regulated by the circumstances or necessities of the case. For the gilding of iron or steel, the surface is first scratched over with chequered lines, then washed in a hot solution of green apricots, dried and heated just short of red-heat. The gold-leaf is then laid on, and rubbed in with agate burnishers, when it adheres by catching into the prepared scratched surface.

Modern gilding is applied to numerous and diverse surfaces and by various distinct processes, so that the art is prosecuted in many ways, and is part of widely different ornamental and useful arts. It forms an important and essential part of frame-making (see Carving and Gilding); it is largely employed in conjunction with cabinet-work, decorative painting and house ornamentation; and it also bulks largely in bookbinding and ornamental leather, gilding basing metals, as in button-making, in the gilt toy trade, in electro-gilt reproductions and in electro-plating; and it is also a characteristic feature in the decoration of pottery, porcelain and glass. The various processes fall under one or other of two heads—mechanical gilding and gilding by chemical agency.

Mechanical Gilding embraces all the operations by which gold-leaf is prepared (see Goldbeating), and the several processes by which it is mechanically attached to the surfaces it is intended to ornament. Thus the leaf is first prepared by the process of amalgam-gilding of the gilder, and the gilding operations of the house decorator, the sign-painter, the bookbinder, the paper-stainer and several others. Polished iron, steel and other metals may be gilded mechanically in a number of ways, the most common being at a temperature just under red-heat, pressing the leaf on with a burnisher and reheating, when additional leaf may be laid on. This is commonly called by the names of Cutting and Reheating.

Chemical Gilding embraces those processes in which the gold used is at some stage in a state of chemical combination. Of these the following are the principal.

Gold Beating—In this process the gold is obtained in a state of extremely fine division, and applied by mechanical means. Cold gilding on silver is performed by a solution of gold in aqua-regia, applied by dipping a lining into the solution, and then superheated to the black of the silver, with ashes of a piece of leather or cork. Wet gilding is effected by means of a dilute solution of chloride of gold with twice its quantity of ether. The liquids are agitated and allowed to rest, when the ether separates and floats on the surface of the acid. The whole mixture is then poured into a funnel with a small aperture, and allowed to rest for some time, when the acid is run off, and the ether separated. The ether will be found to have taken up all the gold from the acid, and may be used for gilding iron or steel, for which purpose the metal is polished with the finest emery and spirits of wine. The wet gilding is applied by means of a burnisher, or flat plate, which deposits the gold, which can now be heated and polished. For small delicate figures a pen or a fine brush may be used for laying on the ether solution. Fire-gilding or Wash-gilding is a process by which an amalgam of gold and mercury is applied to metallic surfaces, the mercury being subsequently volatilized, leaving a film of gold or an amalgam containing from 13 to 16% of mercury. In the preparation of the gold metal, red-heat is used, which are heated red hot, and thrown into mercury previously heated, till it begins to smoke. Upon stirring the mercury with an iron rod, the gold totally disappears. The proportion of mercury to gold is generally as six or eight to one. When the amalgam is cold it is squeezed through chamois leather for the purpose of separating the superfluous mercury; the gold, with about twice its weight of mercury, remains behind, forming a yellowish silvery mass of the consistence of butter. When the metal to be gilt is wrought or chased, it is covered with mercury before the amalgam is applied, which may be more easily spread; but it is the surface of the amalgam that comes in contact with the metal to be gilt. When no such preparation is applied, the surface to be gilded is simply beaten and cleaned with nitric acid. A deposit of mercury is obtained on a metallic surface by means of " quicksilver water," a solution of nitrate of mercury—the nitric acid attacking the metal to which it is applied, and thus leaving a film of free metallic mercury. The amalgam being equally spread over the covered surface of the metal, the mercury is then sublimed by heat just sufficient for that purpose; for, if it is too great, part of the gold may be driven off, or it may run together and leave some of the surface of the metal bare. When the mercury has evaporated, as it is blown away by the smoke, the metal must undergo other operations, by which the fine gold colour is given to it. First, the gilded surface is rubbed with a scratch brush of brass wire, until the gold is reduced to a polish, which is then called "gilding wax," and again exposed to the fire until the wax is burnt off. This wax is composed of beeswax mixed with some of the following substances,
viz. red ochre, verdigris, copper scales, alum, vitriol, borax. By this operation the colour of the gilding is heightened; and the effects can be obtained by a process of successive applications, remaining after the former operation. The dissipation is well 

affected by this equable application of heat. The gilt surface is then covered over with nitre, alum or other salts, ground together, and mingled with a mixture of water and ammonium. The mixture of metal thus covered is exposed to a certain degree of heat, and then quenched in water. By this method its colour is further improved and a certain amount of its surface is affected by the process of reparation. The theory is that the gilt, by its several applications, describes a gradient of gold as the smallest quantity that may be used for the gilding of 12 dozen of buttons 1 in. in diameter.

**Gilding of Pottery and Porcelain.**—The quantity of gold consumed for these purposes is very large. The gold used is dissolved in aqua-regia, and the acid is driven off by heat, or the gold may be precipitated by means of sulphate of iron. In this pulverulent state the gold is mixed with 1/10 of its weight of oxide of bismuth, together with a small quantity of borax and gum water. The mixture is applied to the articles with a camel’s hair pencil, and after passing through the fire the gold is of a dingy colour, but the insue is brought out by Frey’s preparation of agate and bloodstone, and afterwards cleaning with vinegar or white-lead.

**Gilds, or Guilds.** Medieval gilds were voluntary associations formed for the mutual aid and protection of their members. Among the gildsmen there was a strong spirit of fraternal cooperation or Christian brotherhood, with a mixture of worldly and religious ideals—the support of the body and the salvation of the soul. Early meanings of the root *gild* or *gore* were expiation, penalty, sacrifice or worship, feast or banquet, and contribution or payment; it is difficult to determine which is the earliest meaning, and we are not certain whether the gildsmen were originally those who contributed a certain sum of money to those who worked in any craft or trade. Their fraternities or societies may be divided into three classes: religious or benevolent, merchant and craft gilds. The last two categories, which do not become prominent anywhere in Europe until the 12th century, had, like all gilds, a religious tinge, but their aims were primarily worldly, and their functions were mainly of an economic character.

1. **Origin.**—Various theories have been advanced concerning the origin of gilds. Some writers regard them as a continuation of the Roman collegia and sodalitates, but there is little evidence to prove by burning of a unity of existence of the Roman and Germanic fraternities. A more widely accepted theory derives gilds wholly or in part from the early Germanic or Scandinavian sacrificial banquets. Much influence is ascribed to this heathen element by Lujo Brentano, Karl Hegel, W. E. Wilda and other writers. This view does not seem to be tenable, for the old sacrificial carousals lack two of the essential elements of the gilds, namely corporate solidarity or permanent association and the spirit of Christian brotherhood. Dr Max Pappenheim has ascribed the origin of Germanic gilds to the northern “foster-

brotherhood” or “sworn-brotherhood,” which was an artificial bond of union between two or more persons. After intermingling their blood in the earth and performing other peculiar ceremonies, the two contracting parties with grasped hands swore to avenge any injury done to either of them. The objections to this theory are fully stated by Hegel (Städe und Gilden, 1. 250-255). The foster-brotherhood seems to have been unknown to the Franks and the Anglo-Saxons, the nations in which medieval gilds first appear; and hence Dr Pappenheim’s conclusions, if only for the Anglo-Saxons, are not of great standing.

No theory on this subject can be satisfactory which wholly ignores the influence of the Christian church. Imbued with the idea of the brotherhood of man, the church naturally fostered the early growth of gilds and tried to make them displace the old heathen banquets. The work of the church was, however, directive rather than creative. Gilds were a natural manifestation of the associative spirit which is inherent in mankind. The same needs produce in different ages associations which have striking resemblances, but those of each age have peculiarities which indicate a spontaneous growth. It is not necessary to seek the germ of gilds in any antecedent age or institution. When the old kin-bond or *maeght* was beginning to weaken or 

dissolve, and the state did not yet afford adequate protection to its citizens, individuals naturally united for mutual help.

Gilds are first mentioned in the Carolingian capitularies of *779, and in the capitularies of *821* of Charlemagne. The Nantes gilds early in the 9th century, the text of which has been preserved in the ecclesiastical ordinances of Hincmar of Rheims (A.D. 852). The capitularies of 805 and 821 also contain vague references to sworn unions of some sort, and a capitation of 584 prohibits vilesines from forming associations “vulgarly called gilds” against those who have despoiled them. The Carolingians evidently regarded such “conjunctions” as “conspirations” dangerous to the state. The gilds of Norway, Denmark and Sweden are first mentioned in the 11th, 12th and 14th centuries respectively; those of France and the Netherlands in the 11th.

Many writers believe that the earliest references to gilds come from England. The laws of Ine speak of *gigildan* who help each other pay the *wergel*, but it is not entirely certain that they were members of gild fraternities in the later sense. These are more clearly referred to in England in the second half of the 9th century, though we have little information concerning them before the 11th century. To the 12th century belong the statutes of the fraternities of Cambridge, Abbotshury and Exeter. They are important because they form the oldest body of gild ordinances extant in Europe. The thanes’ gild at Cambridge afforded help in blood-feuds, and provided for the payment of the *wergel* in case a member killed any one. The religious element was more prominent in Orcy’s gild at Abbotshury and in the fraternity at Exeter; their ordinances exhibit much solicitude for the salvation of the brethren’s souls. The Exeter gild also gave assistance when property was destroyed by fire. Prayers for the dead, attendance at funerals of gildsmen, periodical banquets, the solemn entrance oaths, fines for neglect of duty and for improper conduct, contributions to a common purse, mutual assistance in distress, periodical meetings in the guildhall,—in short, all the characteristic features of the later gilds already appear in the statutes of these Anglo-Saxon fraternities. Some continental writers, in dealing with the origin of municipal government throughout western Europe, have, however, ascribed too much importance to the Anglo-Saxon gilds, regarding their existence and development as evidence that they form the germ of medieval municipal government. This view rests almost entirely on conjecture; there is no good evidence to show that there was any organic connexion between gilds and municipal government in England before the coming of the Normans. It should also be noted that there is no trace of the existence of either craft or merchant gilds in England before the Norman Conquest. Commerce and industry were not yet sufficiently developed to call for the creation of such associations.

2. **Religious Gilds after the Norman Conquest.**—Though we have not much information concerning the religious gilds in the 12th century, they doubtless flourished under the Anglo-Norman kings, and we know that they were numerous, especially in the boroughs, from the 13th century onward. In 1388 parliament ordered that every sheriff in England should call upon the masters and wardens of all gilds and brotherhoods to send to the king’s council in Chancery, before the 2nd of February 1380, full returns regarding their foundation, ordinances and property. Many of these returns were edited by J. Toulmin Smith (1816-1869), and they throw much light on the functions of the gilds. Their ordinances are similar to those of the above-mentioned Anglo-Saxon fraternities. Each member took an oath of admission, paid an entrance-fee, and made a small annual contribution to the common fund. The brethren were aided in old age, sickness and poverty, often also in cases of loss by robbery, shipwreck and confiscation; for example, any member of the gild of St Catherine, Aldersgate, was to be assisted if he “fall into poverty or be injured through age, or through fire or water, thieves or sickness.” Alms were often
GILDs

given even to non-gildsmen; lights were supported at certain altars; feasts and processions were held periodically; the functions of the religious gilds supported schools, or helped to maintain roads, bridges and town-walls, or even came, in course of time, to be closely connected with the government of the borough; but, as a rule, they were simply private societies with a limited sphere of activity. They are important because they played a prominent rôle in the social life of England, especially as eleemosynary institutions, down to the time of their suppression in 1547. Religious gilds, closely resembling those of England, also flourished on the continent during the middle ages.

3. **The Gild Merchant.**—The merchant and craft fraternities are particularly interesting to students of economic and municipal history. The gild merchant came into existence in England soon after the Norman Conquest, as a result of the increasing importance of trade, and it may have been transplanted from Normandy. Until clearer evidence of foreign influence is found, it may, however, be safer to regard it simply as a new application of the old gild principle, though this new application may have been stimulated by continental example. The evidence seems to indicate the pre-existence of the gild merchant in Normandy, but it is not mentioned anywhere on the continent before the 11th century. It spread rapidly in England, and from the reign of John onward we have evidence of its existence in many English boroughs. But in some prominent towns, notably London, Colchester, Norwich and the Cinque Ports, it seems never to have been adopted. In fact it played a more conspicuous rôle in the small boroughs than in the large ones. It was regarded by the townsmen as one of their most important privileges. Its chief function was to regulate the trade monopoly conveyed to the borough by the royal grant of gild mercatoria. A grant of this sort implied that the gildsmen had the right to trade freely in the town, and to impose payments and restrictions on others who desired to exercise that privilege. The ordinances of a gild merchant thus aimed to protect the brethren from the commercial competition of strangers or non-gildsmen. More freedom of trade was allowed at all times in the selling of wares by wholesale, and also in retail dealings during the time of markets and fairs. The ordinances were enforced by an alderman with the assistance of two or more deputies, or by one or two masters, wardens or keepers. The Morwnspeches were periodical meetings at which the brethren feasted, revised their ordinances, admitted new members, elected officers and transacted other business.

It has often been asserted that the gild merchant and the borough were identical, and that the former was the basis of the whole municipal constitution. But recent research has disputed this theory both in England and on the continent. Much evidence has been produced to show that gild and borough, gildsmen and burgesses, were originally distinct conceptions, and that they continued to be discriminated in most towns throughout the middle ages. Admission to the gild was not restricted to burgesses; nor did the brethren form an aristocratic body having control over the whole municipal polity. No good evidence has, moreover, been advanced to prove that this or any other kind of gild was the germ of the municipal constitution. On the other hand, the gild merchant was certainly an official organ or department of the borough administration, and it exerted considerable influence upon the economic and corporative growth of the English municipalities.

Historians have expressed divergent views regarding the early relations of the craftsmen and their fraternities to the gild merchant. One of the main questions in dispute is whether artisans were excluded from the gild merchant. Many of them seem to have been admitted to membership. They were regarded as merchants, for they bought raw material and sold the manufactures of the workmen. The sharp line of demarcation was drawn between the two classes in the 12th and 13th centuries. Separate societies of craftsmen were formed in England soon after the gild merchant came into existence; but at first they were few in number. The gild merchant did not give birth to the craft fraternities or have anything to do with their origin; nor did it delegate its authority to them. In fact, there seems to have been little or no organic connexion between the two classes of gilds. As has already been intimated, however, many artisans probably belonged both to their own craft fraternity and to the gild merchant, and the latter, owing to its great power in the town, may have exercised some sort of supervision over the craftsmen and their societies. When the king bestowed upon the tanners or weavers or any other body of artisans the right to have a gild, they secured the monopoly of working and trading in their branch of industry. Thus with every creation of a craft fraternity the gild merchant was weakened and its sphere of activity was diminished, though the new bodies were subsidiary to the older and larger fraternity. The greater the commercial and industrial prosperity of a town, the more rapid was the multiplication of craft gilds, which was a natural result of the ever-increasing division of labour. The old gild merchant remained longest intact and powerful in the smaller boroughs, in which, owing to the predominance of agriculture, few or no craft gilds were formed. In some of the larger towns the craft gilds were prominent already in the 13th century, but they became much more prominent in the first half of the 14th century. Their increase in number and power was particularly rapid in the time of Edward III., whose reign marks an era of industrial progress. Many master craftsmen now became wealthy employers of labour, dealing extensively in the wares which they produced. The class of dealers or merchants, as distinguished from trading artisans, also greatly increased and established separate fraternities. When these various unions of dealers and of craftsmen embraced all the trades and branches of production in the town, little or no vitality remained in the old gild merchant; it ceased to have an independent sphere of activity. The tendency was for the single organization, with a general monopoly of trade, to be replaced by a number of separate organizations representing the various trades and handicrafts. In short, the function of guarding and supervising the trade monopoly split up into various fragments, the aggregate of the crafts superseding the old general gild merchant. This transference of the authority of the latter to a number of distinct bodies and the consequent disintegration of the old organization was a gradual spontaneous movement,—a process of slow displacement, or natural growth and decay, due to the play of economic forces,—which, generally speaking, may be assigned to the 14th and 15th centuries, the very period in which the craft gilds attained the zenith of their power. While in most towns the name and the old organization of the gild merchant thus disappeared and the institution was displaced by the aggregate of the crafts towards the close of the middle ages, in some places it survived long after the 15th century either as a religious fraternity, shorn of its old functions, or as a periodic feast, or as a vague term applied to the whole municipal corporation.

On the continent of Europe the medieval gild merchant played a less important rôle than in England. In Germany, France and the Netherlands it occupies a less prominent place in the town charters and in the municipal polity, and often corresponds to the later fraternities of English dealers established either to carry on foreign commerce or to regulate a particular part of the local trade monopoly.

4. **Craft Gilds.**—A craft gild usually comprised all the artisans in a single branch of industry in a particular town. Such a fraternity was commonly called a "mystery" or "company" in the 15th and 16th centuries, though the old term "gild" was not yet obsolete. "Gild" was also a common designation in north Germany, while the corresponding term in south Germany was Zunft, and in France métier. These societies are not clearly visible in England or on the continent before the early part of the 12th century. With the expansion of trade and industry the various fraternities were drawn together for mutual protection. Some German writers have maintained that these craft organizations emanated from
manorial groups of workmen, but strong arguments have been advanced against the validity of this theory (notably by F. Kentgen). It is unnecessary to elaborate any profound theory regarding the origin of the craft gilds. The union of men of the same occupation was not unknown in the 13th and 14th centuries, but the statute of apprenticeship, passed in 1351, did not come into effect until the 15th century. The number of the craft gilds increased in the 14th century, the whole monopoly of the trade of the town. In the 15th century, the journeymen or yeomen began to set up fraternities in defence of their rights. The formation of these societies marks a clef within the ranks of some particular class of artisans—a conflict between employers, or master artisans, and workmen. The journeymen combined to protect their special interests, not only as regards hours of work and rates of wages, and they fought with the masters over the labour question in all its aspects. The result was a struggle of organized bodies of masters and journeymen was widespread throughout western Europe, but it was more prominent in Germany than in France or England. This was indeed one of the main features of German industrial life in the 15th century. In England the fraternities of journeymen, after struggling a while for complete independence, seem to have fallen under the supervision and control of the masters' gilds; in other words, they became subsidiary or affiliated organs of the older craft fraternities.

An interesting phenomenon in connexion with the organization of crafts is their tendency to amalgamate, which is occasionally visible in England in the 15th century, and more frequently in the 16th and 17th. A similar tendency is visible in the Netherlands and in some other parts of the continent already in the 14th century. Several fraternities—old gilds or new companies, with their respective cognate or heterogeneous branches of industry and trade—were fused into one body. In some towns all the crafts were thus consolidated into a single fraternity; in this case a body was reproduced which regulated the whole trade monopoly of the borough, and hence bore some resemblance to the old gild merchant.

In dealing briefly with the modern history of craft gilds, we may confine our attention to England. In the Tudor period the policy of the crown was to bring them under public or national control. Laws were passed, for example in 1503, requiring that new ordinances of "fellowships of crafts or misteries" should be approved by the royal justices or by other crown officers; and the authority of the companies to fix the price of wares was thus restricted. The statute of 5 Elizabeth, c. 4, also curtailed their jurisdiction over journeymen and apprentices (see Apprentice-

The craft fraternities were not suppressed by the statute of 1547 (1 Edward Vl). They were indeed expressly exempted from its general operation. Such portions of their revenues as were devoted to definite religious observances were, however, appropriated by the crown. The revenues confiscated were those used for "the finding, maintaining or sustentation of any priest or of any anniversary, or obit, lamp, light or other such things." This has been aptly called "the disendowment of the religion of the misteries." Edward Vl's statute marks no break of continuity in the life of the craft organizations. Even before the Reformation, however, signs of decay had already begun to appear, and these multiplied in the 16th and 17th centuries. The old gild system was breaking down under the action of new economic forces. Its dissolution was due especially to the introduction of new industries, organized on a more modern basis, and to the extension of the domestic system of manufacture. Thus the companies gradually lost control over the regulation of industry, though they still retained their old monopoly in the 17th century, and in many cases even in the 18th. In fact, many craft fraternities still survived in the second half of the 18th century, but their usefulness had disappeared. The medieval form of association was incompatible with the new ideas of individual liberty and free competition, with the greater separation of capital and industry, employers and workmen, and with the introduction of the factory system. Intent only on promoting their own interests and disregarding the welfare of the community, the old companies had become an unmitigated evil. Attempts have been made to find in them the progenitors of the trades
unions, but there seems to be no immediate connexion between the latter and the craft gilds. The privileges of the old fraternities were not formally abolished until 1835; and the substantial remains or spectral forms of some are still visible in other towns and districts.

GILEAD (i.e. "hard" or "rugged," a name sometimes used, both in earlier and in later writers, to denote the whole of the territory occupied by the Israelites eastward of Jordan, extending from the Arnon to the southern base of Hermon (Deut. xxxiv. 1; Judg. xx. 1; Jos. Ant. xii. 3, 4). More precisely, however, it was the usual name of that picturesque hill country which is bordered on the N. by the Hieron (Yarmuk), on the W. by the Jordan, on the S. by the Arnon, and on the E. by a line which may be said to follow the meridian of Ammān (Philadelphia or Rabbath-Ammon). It thus lies wholly within 36° 25' and 36° 42' N. lat. and 35° 34' and 36° E. long., and is cut in two by the Jabbok. Excluding the narrow strip of low-lying plain along the Jordan, it has an average elevation of 2500 ft. above the Mediterranean; but, as seen from the west, the relative height is very much increased by the depression of the Jordan valley. The general outline of its form is pointed, but its form outline, having the appearance of an unbroken wall; in reality, however, it is traversed by a number of deep ravinies (wadis), of which the most important are the Yābis, the Ajjūn, the Rājib, the Zerkā (Jabbok), the Heshan, and the Zerkā Ma‘īn. The great mass of the Gilead range is formed of Jura limestone, the base slopes being sandstone partly covered by white marls. The eastern slopes are comparatively bare of trees; but the western are well supplied with oak, terebinth and pine. The pastures are everywhere luxuriant, and the wooded heights and winding glens, in which the tangled shrubbery is here and there broken up by open glades and flat meadows of green turf, exhibit a beauty of vegetation such as is hardly to be seen in any other district of Palestine.

The first biblical mention of "Mount Gilead" occurs in connexion with the reconciliation of Jacob and Laban (Genesis xxxiii.). The composite nature of the story makes an identification of the exact site difficult, but one of the narrators (E) seems to have in mind the ridge of what is now known as Jabal Ajlūn, probably not far from Mahneh (Mahanaim), near the head of the Wadi Yābis. Some investigators incline to Sīf, or to the Jebel Kafraka. At the period of the Israelite conquest the portion of Gilead northward of the Jabbok (Zerkā) belonged to the dominions of Og, king of Bashan, while the southern half was ruled by Sihon, king of the Amorites, having been at an earlier date wrested from Moab (Num. xxi. 24; Deut. iii. 12-16). These two sections were allotted respectively to Manasseh and to Reuben and Gad, both districts being peculiarly suited to the pastoral and nomadic character of these tribes. A somewhat wild Bedouin disposition, fostered by their surroundings, was retained by the Israelite inhabitants of Gilead to a late period of their history, and seems to be to some extent discernible in what we read alike of Jephthah, of David's Gadites, and of the prophet Elijah. As the eastern frontier of Palestine, Gilead bore the first brunt of Syrian and Arabian attacks.

After the close of the Old Testament history the word Gilead seldom occurs. It seems to have soon passed out of use as a precise geographical designation; for though occasionally mentioned by Apocryphal writers, by Josephus, and by Eusebius, the allusions are all vague, and show that those who made them had no definite knowledge of Gilead proper. In Josephus and the New Testament the name Perea or περαια του Ἰωβαννου is most frequently used; and the country is sometimes spoken of as a small district, sometimes as a vast area. At present Gilead appears to include the valleys in which Greek colonists had established themselves during the reign of the Seleucidae. At present Gilead south of the Jabbok alone is known by the name of Jebel Jillut (Mount Gilead), the northern portion between the Jabbok and the Yarmuk being called Jebel Ajjūn. Jebel Jillut includes Jebel Osha, and has for its capital the town of Es-Salt. The cities of Gilead expressly mentioned in the Old Testament are Ramoth, Jabesh and Jazer. The first of these has been variously identified with Es-Salt, with Reimun, with Jerash or Gerass, with Jer-Rema, with Sirum, and with Salhān. Opinions are also divided on the question of its identity with Mizpah-Gilead (see Encyc. Biblica, art. "Ramoth-Gilead"). Jabesh is perhaps to be found at Meriamim, less probably at ed-Deir; Jazer, at Yajuz near Jogrbehah, rather than at Sar. The city named Gilead (Judg. x. 17, xii. 7; Hos. vi. 3, xii. 11) has hardly been satisfactorily explained; perhaps the text has suffered.

The "balm" (Heb. סֵבע) for which Gilead was so noted (Gen. xlvii. 11; Jer. viii. 22, xlvii. 11; Ezek. xxvii. 17), is probably identified with the essential oil of the Spicata Nelficus, or "balm of Gilead" or "Balsamodendron epoebolasium," is more likely the Hebrew מָר, which the English Bible wrongly renders "myrrh." See G. A. Smith, Hist. Geog. xxiv. foli. (R. A. M.)

GILES (Gul. GILLES, ST.), the name given to an abbot whose festival is celebrated on the 1st of September. According to the legend, he was an Athenian (Aiónbas, Aegidius) of royal descent; and on his parents' being slain he distributed his possessions among the poor, took ship, and landed at Marseilles. Thence he went to Arles, where he remained for two years with St. Caesarius. He then retired into a neighbouring desert, where he lived upon herbs and upon the milk of a hind which came to him at stated hours. He was discovered there one day by Flavius, the king of the Goths, who built a monastery on the place, of which he was the first abbot. Scholars are very much divided as to the date of his life, some holding that he lived in the 6th century, others in the 7th or 8th. It may be regarded as certain that St. Giles was buried in the hermitage which he had founded in a spot which was afterwards the town of St-Gilles (diocese of Nimes, department of Gard). His reputation for sanctity attracted many pilgrims. Important gifts were made to the church which contained his body, and a monastery grew up hard by. It is probable that the Visigothic princes who were in possession of the country protected and enriched this monastery, and that it was destroyed by the Saracens at the time of their invasion in 721. But there are no authentic data before the 9th century concerning his history. In 808 Charlemagne took the abbey of St-Gilles under his protection, and it is mentioned among the monasteries from which only prayers for the prince and the state were due. In the 12th century the pilgrimages to St-Gilles are cited as among the most celebrated of the time. The cult of the saint, who came to be regarded as the special patron of lepers, beggars and cripples, spread very extensively over Europe, especially in England, Scotland, France, Belgium and Germany. The church of St. Giles, Cripplegate, London, was built about 1000, while the hospital for lepers at St. Giles-in-the-Fields (near New Oxford Street) was
GILFILLAN—GILGAMESH

found by Queen Matilda in 1117. In England alone there are about 130 churches dedicated to this saint. In Edinburgh the church of St Giles could boast that it was the first congregation of an English St Giles are very frequently met with in early French and German art, but are much less common in Italy and Spain.

GILFILLAN, GEORGE (1813-1878), Scottish author, was born on the 30th of January 1813, at Comrie, Perthshire, where his father, the Rev. Samuel Gilfillan, the author of some theological works, was for many years minister of a Secession congregation. After an education at Glasgow University, in March 1836 he was ordained pastor of a Secession congregation in Dundee. He published a volume of his discourses in 1839, and shortly afterwards another sermon on "Hades," which brought him under the scrutiny of his co-presbyters, and was ultimately withdrawn from circulation. Gilfillan next contributed a series of sketches of celebrated contemporary authors to the Damiens Herald, then edited by Thomas Aird; and these, with several new ones, formed his first Gallery of Literary Portraits, which appeared in 1846, and had a wide circulation. It was quickly followed by a Second and a Third Gallery. In 1851 his most successful work, the Bards of the Bible, appeared. His aim was that it should be a "poem on the Bible," and it was far more rhaphesmal than critical. His Martyrs and Heroes of the Scottish Covenant appeared in 1832, and in 1836 he produced a partly autobiographical, partly fabulous, History of a Man. For thirty years he was engaged upon a long poem, on Night, which was published in 1867, but its theme was too vast, vague and unmanageable, and the result was a failure. He also edited an edition of the British Poets. As a lecturer and as a preacher he drew large crowds, but his literary reputation has not proved permanent. He died on the 13th of August 1878. He had just finished a new life of Burns designed to accompany a new edition of the works of that poet.

GILGAL (Heb. for "circle" of sacred stones), the name of several places in Palestine, mentioned in the Old Testament. The name is not found east of the Jordan.

1. The first and most important was situated "in the east border of Jericho" (Josh. iv. 19), on the border between Judah and Benjamin (Josh. xv. 7). Josephus (Ant. v. 1, 4) places it 50 stadia from Jericho and 10 from Jericho (the New Testament site). In Jerome (Onomasticon, s.v. "Galga") places Gilgal 2 Roman miles from Jericho, and speaks of it as a deserted place held in wonderful veneration ("muro cultu") by the natives. This site, which in the middle ages appears to have been lost—Gilgel being shown farther north—was in 1865 recovered by a German traveller (Hermann Schacke), and fixed by the English survey party, though not beyond dispute. It is about 2 m. east of the site of Byzantine Jericho, and 1 m. from modern er-Rihâ. A fine tamarisk, traces of a church (which is mentioned in the 9th century), and a large reservoir, now filled up with mud, remain. The place is called Jiljilieh, and its position north of the valley of Achor (Wadi Kelt) and east of Jericho agrees well with the biblical indications above mentioned. A tradition connected with the fall of Jericho is attached to the site (see C. R. Conder, Tent Work, 203 ff.). This sanctuary and camp of Israel held a place in the national regard, and is often mentioned in Judges and Samuel. But whether this is the Gilgal spoken of by Amos and Hosea in connexion with Bethel is by no means certain (see l.c.) below.

2. Gilgal, mentioned in Josh. xii. 23 in connexion with Dor, appears to have been situated in the maritime plain. Jerome (Onomasticon, s.v. "Gelgal") speaks of a town of the name of Roman miles north of Antipatris (Ras el 'Ain). This is apparently the modern Kalkilia, but about 4 m. north of Antipatris is a large village called Jilljilieh, which is more probably the biblical town.

3. The third Gilgal (2 Kings iv. 38) was in the mountains (compare 1 Sam. vii. 16, 2 Kings ii. 1-3) near Bethel. Jerome mentions this place also (Onomasticon, s.v. "Galga"). It appears to be the present village of Jilljilieh, about 7 English miles north of Beithel (Bethel). It may have absorbed the old site of Shiloh and been the sanctuary famous in the days of Amos and Hosea.

4. Deut. xi. 30 seems to imply a Gilgal near Gerizim, and there is still a place called Julejilli on the plain of Makha, 23 s. E. of Shechem. This may have been Amos' Gilgal and was almost certainly that of i. Masc. ix. 2.

5. The Gilgal described in Josh. xv. 7 is the same as the Beth-Gilgal of Neh. xii. 29; its site is not known. (R. A. S. M.)

GILGAMESH, EPIC OF, the 19th c. given to one of the most important literary products of Babylonia, from the name of the chief personage in the series of tales of which it is composed.

Though the Gilgamesh Epic is known to us chiefly from the fragments found in the royal collection of tablets made by Assur-bani-pal, the king of Assyria (668-626 B.C.) for his palace at Nineveh, internal evidence points to the high antiquity of at least some portions of it, and the discovery of a fragment of the epic in the older form of the Babylonian script, which can be dated as 2000 B.C., confirms this view. Equally certain is a second observation of a general character that the epic originating as the greater portion of the literature in Assur-bani-pal's collection in Babylonia is a composite product, that is to say, it consists of a number of independent stories or myths originating at different times, and united to form a continuous narrative with Gilgamesh as the central figure. This view naturally raises the question whether the independent stories were all told of Gilgamesh or, as almost always happens in the case of ancient tales, were transferred to Gilgamesh as a favourite popular hero. Internal evidence again comes to our aid to lend its weight to the latter theory.

While the existence of such a personage as Gilgamesh may be admitted, he belongs to an age that could only have preserved a dim recollection of his achievements and adventures through oral traditions. The name is not Babylonian, and what evidence as to its origin there is points to his having come from Elam, to the east of Babylonia. He may have belonged to the people known as the Kassites who at the beginning of the 18th century B.C. entered Babylonia from Elam, and obtained control of the Euphrates valley. Why and how he came to be a popular hero in Babylonia cannot with our present material be determined, but the epic indicates that he came as a conqueror and established himself at Erech. In so far as we have embodied in the first part of the epic dim recollections of actual events, but we soon leave the solid ground of fact and find ourselves soaring to the heights of genuine myth. Gilgamesh becomes a god, and in certain portions of the epic clearly plays the part of the sun-god of the spring-time, taking the place apparently of Tammuz or Adonis, the youthful sun-god, though the story shows traits that differentiate it from the ordinary Tammuz myths. A separate stratum in the Gilgamesh epic is formed by the story of Eabani—introduced as the friend of Gilgamesh, who joins him in his adventures. There can be no doubt that Eabani, who symbolizes primeval man, was a figure originally entirely independent of Gilgamesh, but his story was incorporated into the epic by that natural process to be observed in the national epics of other peoples, which tends to connect the favourite hero with all kinds of tales that for one reason or the other become enshrined in the popular mind. Another stratum is represented by the story of a favourite of the gods known as Ut-Napištim, who is said from a destructive storm and flood that destroys

*1 The name of the hero, written always ideographically, was for a long time provisionally read Lugalbar; but a tablet discovered by T. Pinches gave the equivalent Gilgamesh (see Jastrow, Religion of Babylonia and Assyria, p. 468).
his fellow-citizens of Shurrupak. Gilgamesh is artificially brought into contact with Ut-Napishtim, to whom he pays a visit for the purpose of learning the secret of immortal life and perpetual youth which he enjoys. During the visit Ut-Napishtim tells Gilgamesh the story of the flood and of his miraculous escape. Nature myths have been entwined with other episodes in the epic and finally the theologians took up the combined stories of Gilgamesh and the megalithic tradition and force of certain doctrines of the Babylonian religion. In its final form, the outcome of an extended and complicated literary process, the Gilgamesh Epic covered twelve tablets, each tablet devoted to one adventure in which the hero plays a direct or indirect part, and the whole covering according to the most plausible estimate about 3000 lines. Of all twelve tablets portions have been found among the remains of Assur-bani-pal’s library, but some of the tablets are so incomplete as to leave even their general contents in some doubt. The fragments do not all belong to one copy. Of some tablets portions of two, and of some tablets portions of as many as four, copies have turned up, pointing therefore to the great popularity of the production. The best preserved are Tablets VI, and XI., and of the total about 1500 lines are now known, wholly or in part, while of those partially preserved quite a number can be restored. A brief summary of the contents of the twelve may be indicated as follows:

In the 1st tablet, after a general survey of the adventures of Gilgamesh, his friend, Eabani, is described, where he enlists the services of all the young able-bodied men in the building of the great wall of the city. The people sigh under the burden imposed, and call upon the goddess Aruru to create a being who might act as a rival to Gilgamesh, curb his strength, and dispute his tyrannous control. The goddess consents, and creates Eabani, who is described as a wild man, living with the gazelles and the beasts of the field. Eabani, whose name, signifying “Ea creates,” points to the tradition which made Ea (q.v.) the creator of humanity, symbolizes primeval man. Through a hunter, Eabani and Gilgamesh are brought together, but instead of becoming rivals, they are joined in friendship. Eabani is induced by the snares of a maiden to abandon his life with the animals and to proceed to Ereh, where Gilgamesh, who has been told in several dreams of the coming of Eabani, awaits him. Together they proceed upon several adventures, which are related in the following four tablets. At first, indeed, Eabani curses the fate which led him away from his former life, and Gilgamesh is represented as bewailing Eabani’s dissatisfaction. The sun-god Shamash calls upon Eabani to remain with Gilgamesh, who pays him all honours in his palace at Ereh. With the decision of the two friends to proceed to the forest of cedars in which the goddess Irina—a form of Ishtar—dwells, and which is guarded by Khumbaba, the 2nd tablet ends. In the 3rd tablet, very imperfectly preserved, Gilgamesh appeals through a Shamash priestess Rimat-Belti to the sun-god Shamash for his aid in the proposed undertaking. The 4th tablet contains a description of the formidable Khumbaba, the guardian of the cedar forest. In the 5th tablet Gilgamesh and Eabani reach the forest. Encouraged by dreams, they proceed against Khumbaba, and despatch him near a specially high cedar over which he held guard. This adventure against Khumbaba belongs to the Eabani stratum of the epic, into which Gilgamesh is artificially introduced. The basis of the 6th tablet is the familiar nature-myth of the change of seasons, in which Gilgamesh plays the part of the youthful solar god of the springtime, who is wooed by the goddess of fertility, Ishtar. Gilgamesh, recalling to the goddess the sad fate of those who fall a victim to her charms, rejects the offer. In the course of his recital snatches of the Adonis, a second Greco-Turkish Adonis tale, in which Tammuz, the youthful bridegroom, is slain by his consort Ishtar. The goddess, enraged at the insult, asks her father Anu to avenge her. A divine bull is sent to wage a contest against Gilgamesh, who is assisted by his friend Eabani. This scene of the fight with the bull is often depicted on seal cylinders. The two friends by their united force succeed in killing the bull, and then after performing certain votive and purification rites return to Ereh, where they are hailed with joy. In this adventure it is clearly Eabani who is artificially introduced in order to maintain the association with Gilgamesh. The 7th tablet contains the Eabani stratum. The hero is smitten with sore disease, but the fragmentary condition of this and the succeeding tablet is such as to envelop in doubt the nature of his affliction. The 8th tablet records the death of Eabani. The 9th and 10th tablets, exclusively devoted to Gilgamesh, describe his wanderings in quest of Ut-Napishtim, from whom he hopes to learn how he may escape the fate that has overtaken his friend Eabani. He goes through mountain passes and encounters lions. At the entrance to the mountain Mashu, scorpion-men stand guard, from one of whom he receives advice as to how to pass through the Mashu district. He succeeds in doing so and finds himself in a wonderful park, which lies along the sea coast. In the 10th tablet the goddess Sabitu, who, as guardian of the sea, first bolts her gate against Gilgamesh, after learning of his quest, helps him to pass in a ship across the sea to the “waters of death.” The ferry-man of Ut-Napishtim brings him safely through these waters, despite the difficulties and dangers of the voyage, and at last the hero finds himself face to face with Ut-Napishtim. In the 11th tablet, Ut-Napishtim tells the famous story of the Babylonian flood, which is so patently attached to Gilgamesh in a most artificial manner. Ut-Napishtim and his wife are anxious to help Gilgamesh to the end of his years, and so far as he has it, closes.

The reason why the flood episode and the interview with the dead Eabani are introduced is quite clear. Both are intended as illustrations of doctrines taught in the schools of Babylonia; the former to explain that only the favourites of the gods can hope under exceptional circumstances to enjoy life everlasting; the latter to emphasize the impossibility for ordinary mortals to escape from the inactive shadowy existence led by the dead, and to inculcate the duty of proper care for the dead. That the astral-mythological system is also introduced into the epic is clear from the division into twelve tablets, which correspond to the yearly course of the sun, while throughout there are indications that all the adventures of Gilgamesh and Eabani, including those which have an historical background, have been submitted to the influence of this system and projected on to the heavens. This interpretation of the popular tales, according to which the career of the hero can be followed in its entirety and in detail in the movements in the heavens, in time, with the growing predominance of the astral-mythological system, overshadowed the other factors involved, and it is in this form, as an astral myth, that it passes through the ancient world and leaves its traces in the folk-tales and myths of Hebrews, Phoenicians, Syrians, Greeks and Romans throughout Asia Minor and even in India.

BIBLIOGRAPHY.—The complete edition of the Gilgamesh Epic by Paul Haupt under the title Das babylonische Nimrodepos (Leipzig, 1884–1891), with the 12th tablet in the Beiträge zur Assyriologie, was published in 1914. The present translation is adapted from the best available German text prepared by Peter Haupt in view of E. von Schrader’s Keilschriftliche Bibliothek (Berlin, 1900), pp. 116-273. See also the same author’s comprehensive work, Das Gilgamesch-Epos (Jena, 1904), vol. ii., to follow an English translation of the chief portions in a new section of Religion of Babylonia and Assyria (Boston, 1898), ch. xxxii. (M. J.)

GILGIT, an outlying province in the extreme north-west of India, over which Kashmir has reasserted her sovereignty. Only a part of the basin of the river Gilgit is included within its political boundaries. There is an intervening width of
mountainous country, represented chiefly by glaciers and ice-fields, and intersected by narrow sterile valleys, measuring some 100 to 150 m. in width, to the north and north-east, which separates the province of Gilgit from the Chinese frontier beyond the Muztagh and Karakoram. This part of the Kashmir borderland includes Kanjut (or Hunza) and Ladak. To the north-west, beyond the sources of the Yasin and Ghazar in the Shandur range (the two most westerly tributaries of the Gilgit river) is the deep valley of the Yarkhun or Chitral. South of the North-West Frontier Province in 1901, the political charge of Chitral, Dir and Swat, which was formerly included within the Gilgit agency, has been transferred to the chief commissioner of the new province, with his capital at Peshawar. Gilgit proper now forms a wazirat of the Kashmir state, administered by a wazir. Gilgit is also the headquarters of a British political agent, who exercises some supervision over the wazirs, and is directly responsible to the government of India for the administration of the outlying districts or petty states of Hunza, Nagar, Ashkuman, Yasin and Ghizar, the little republic of Chillas, &c. These states acknowledge the suzerainty of Kashmir, paying an annual tribute in gold or grain, but they form no part of its territory.

Within the wider limits of the former Gilgit agency are many mixed races, speaking different languages, which have all been usually classed together under the name Dard. The Dard, however, is unknown beyond the limits of the Kohistan district of the Indus valley to the south of the Hindu Koh, the rest of the inhabitants of the Indus valley belonging to Shin, Kirish or Chillas. The great mass of the Chitral population are Kho (speaking Khowar), and they may be accepted as representing the aboriginal population of the Chitral valley. (See Hindu Kush.) Between Chitral and the Indus the "Dards" of Daristan are chiefly Yeshkuns and Shins, and it would appear from the proportions in which these people occupy the country that they must have primarily moved up from the valley of the Indus in successive waves of conquest, first the Yeshkuns, and then the Shins. No one can put a limit to these invasions, but Biddulph is inclined to class the Yeshkuns with the Yuchi, who conquered the Bactrian kingdom about 120 B.C. The Shins are obviously a Hindu race (as is testified by their veneration for the cow), who spread themselves northwards and eastwards as far as Baltistan, where they collided with the aboriginal Tatar of the Asiatic highlands. But the ethnography of "Daristan," or the Gilgit agency (for the two are roughly speaking, synonymous), requires further investigation, and it would be premature to attempt to frame anything like an ethnographic history of the region, for the provinces of Tangir and Darel have been more fully examined. The wazirat of Gilgit contains a population (1901) of 60,885, all Mahomedans, mostly of the Shahi sect, but not fanatical. The dominant race is that of the Shins, whose language is universally spoken. This is one of the so-called Pishaca languages, an archaic Aryan group intermediate between the Iranian and the Sanskrit.

In general appearance and dress all the mountain-bred peoples extending through these northern districts are very similar. Thick felt coats reaching below the knee, loose "pyajamas" with cloth "putties" and boots (often of English make) are almost universal, the distinguishing feature in their costume being the felt cap worn close to the head and rolled up round the edges. They are on the whole a light-hearted, cheerful race of people, but it has been observed that their temperament varies much with their habitat—those who live on the shadowed sides of mountains being distinctly more morose and more serious in disposition than the dwellers in valleys who catch the winter sunlight. They are, at the same time, bloodthirsty and treacherous to a degree which would appear incredible to a casual observer of their happy and genial manners, exhibiting a strange combination (as has been observed by a careful student of their ways) of "the monkey and the tiger." Addicted to sport of every kind, they pursue no manufacturing industries whatsoever, but are excellent agriculturists, and show great ingenuity in their local irrigation works and in their efforts to bring every available acre of cultivable soil within the irrigated area. Gold washing is more or less carried on in most of the valleys north of the river Gilgit, and gold dust (contained in small packets formed with the petals of a cup-shaped flower) is an invariable item in their official presents and offerings. Gold dust still constitutes part of the annual tribute which, strangely enough, is paid by Hunza to China, as well as to Kashmir.

**Routes in the Gilgit Agency.**—One of the oldest recorded routes through this country is that which connects Mastuj in the Chitral valley with Gilgit, passing through the high ground near Shangur. This forms the high-road between Gilgit and Chitral, and has been engineered into a passable route. From the north three great glacier-bred affluents make their way to the river of Gilgit, joining it at almost equal intervals on both sides of it. The most western of them lies in a rough passage northwards. (1) The Yasin river, which follows a fairly straight course from north to south for about 40 m. from the foot of the Darköt pass across the Shandur range (15,000 ft.) to its junction with the river Gilgit, close to the little fort of Gupis, on the Gilgit-Mastuj road. Much of this valley is cultivated and extremely picturesque. At the head of it is a grand group of glaciers, one of which leads up to the well-known pass of Darköt. (2) 25 m. (by map measurement) below Gupis the Gilgit receives the Ashkuman affluent from the north. The little Lake of Karumbar is large enough to make a possible route, but the head of the lake is sometimes called the source of the river Yarkhun or Chitral; and it seems possible that a part of its waters may be directed in that direction. The Karumbar, or Ashkuman, is nearly twice the length of Yasin, and it is not surprising that half of the available drainage of this country is kept by glaciers, rendering the route along it uncertain and difficult. (3) 40 m. or so below the Ashkuman junction, and nearly opposite the little station of Yeshkuns, the river is crossed to the further contributions from the north which are collected in the Hunza and Nagar basins. These basins include a system of glaciers of such gigantic proportions that they are probably unrivalled in any part of the world. The glacial head of the Hunza is not far from that of the Karumbar, and, like the Karumbar, the river commences with a wide sweep eastwards, following a course roughly parallel to the crest of the Hindu Kush (under whose southern slopes it lies close) for about 40 m. Then striking south for another 40 m., it passes amidst the barren feet of gigantic rock-bound spurs which reach upwards to the Muztagh peaks on the east and to a mass of glaciers and bare rocks on the west, and then amidst the cols which contain towering to an average of 25,000 ft. The next great bend is again to the west for 30 m., before a final change of direction to the south at the historical position of Chitral, and a comparatively straight run of 25 m. to a junction with the Gilgit. The valley of Hunza lies some 10 m. from this point of the western bend, and 20, as the crow flies, from Chalt. Much has been written of the magnificence of the Hunza valley scenery, surrounded as it is by a stupendous ring of snow-capped peaks and brightened with all the radiant beauty that cultivation adds to these mountain valleys; but such scenery must be regarded as exceptional in these northern regions.

(North and South Mountain Tracts.)-Austen and Austen have described the glaciers of Nagar which, enclosed between the Muztagh spurs on the north-east and the frontier peaks of Kashmir (terminating in the same spurs which are the first to be crossed by the mountain passes) presents an almost uninterrupted series from the Hunza valley to the base of those gigantic peaks which stand about Mount Godwin Austen, seem to be set like an ice-sea to define the farthest bounds of the Himalayas. From its uttermost head to the foot of the Himalayas, overwhelming the valley above Nagar, the length of the glaciated ice-bed known under the name of Bisul is said to measure about 90 m. Throughout the mountain region of Kanjut (or Hunza) and Nagar the valleys are deeply sunk between mountain ranges, which are nowhere less than 15,000 ft. in altitude, and which must average about 20,000 ft. As a rule, these valleys are bare of vegetation. Where their summits or spurs of the spurs are touched by the frost, and ice are they bare, bleak and splintered, and the nakedness of the rock scenery extends downward to the very base of the cliffs. The lower levels, however, are clothed all the year round with an uninterrupted carpet of herbs and flowers, and in the spurs and cols which are shaded from the winter sun, are a mass of moss, and ferns and terracotta moss, with the alpine flowers of the mountains. Glacial sheets of snow, where it lies packed and massed together, till the pressure of accumulation forces it out into the main valleys, where it spreads in alluvial fans and up the plains. This formation is especially marked throughout the lower and middle valleys of the Jisuru and Gupis.
the Baroghil group over the main Hindu Kush watershed. The Askarman is headed by the Gazar and Kora Bohlz passes, leading to the valley of the Ab-i-Punja; and the Hunza by the Kilik and Mintaka, the northern exit of the Tashkurgan Pass through the Tashkurgan and the Gilgit basin. They are all about the same height—15,000 ft. All are passable at certain times of the year by small parties, and all are uncertain. In no case do they present insuperable difficulties in their ascent, as the mountains are in general not so lofty as being common to all; but the gorges and precipices which distinguish the approaches to them from the south, the slippery sides of shelving spurs whose feet are washed by raging torrents, the wearing down of the current, and the successive ridges multiplying the gradient indefinitely—these form the real obstacles blocking the way to these northern passes.

Gilgit.—The pretty little station of Gilgit, which lies (8900 ft.; above sea level) spreads itself in terraces above the right bank of the river nearly opposite the opening leading to Hunza, almost nestling under the cliffs of the Hindu Koh, which separates it from thesouthern range of the Kess of Dard. It is an independent and a beautiful little station for the British political officer, with about half a dozen houses for the accommodation of officials, barracks suitable for a battalion of Kashmir troops, and a hospital. Evidences of Buddhist occupation are not wanting in Gilgit, though they are few and unimportant. Such as they are, they appear to prove that Gilgit was once a Buddhist centre, and that the old Buddhist route between Gilgit and the Peshawar plain passed through the gorges and cliffs of the unexplored Dard valley to Thakot under the northern spurs of the Black Mountain.

History.—The Dards are located by Ptolemy with surprising accuracy (Daradoe) on the west of the Upper Indus, beyond the head-waters of the Swat river (Suostus), and north of the Gandarae, i.e. the Gandharis, who occupied Peshawar and the country north of it. The Dards and Chinas also appear in many of the old Pauranic lists of peoples, the latter probably representing the Shin branch of the Dards. This region was traversed by two of the Chinese pilgrims of the early centuries of our era, who have left records of their journeys, viz. Fa-hien, coming from the north in the 5th century, and Boudou, coming from the south in the 15th century. The latter says: "Perils were the roads, and dark the gorges. Sometimes the pilgrim had to pass by loose cords, sometimes by long stretched iron chains. Here there were ledges hanging in mid-air; there flying bridges across abysses; elsewhere paths cut with the chisel, or footings to climb by." Yet even in these inaccessible regions were found great convents, and marvellous images of Buddha. How old the name of Gilgit is we do not know, but it occurs in the writings of the great Mahomedan scholar-al-Biruni, who notices a geographical name of Gilgit. Speaking of the Gilgit, he says: "Leaving the ravine by which you enter Kashmir and entering the plateau, then you have for a march of two or more days on your left the mountains of Bolor and Shamian, Turkish tribes who are called Bhatiavaryan. Their king has the title Bhatta-Shah. Their towns are Gilgit, Aswira and Shiltsha, and their language is the Turkish. Kashmir suffers much from their inroads" (Trs. Sachau, i. 207). There are difficult matters for discussion here. It is impossible to say what ground the writer had for calling them Bhatiavaryan. Their name is so similar that it is very likely they are all of the same race as the Moguls of India, whatever they may mean by that. Gilgit, as far back as tradition goes, was ruled by rajas of a family called Trakane. When this family became extinct the valley was desolated by successive invasions of neighbouring rajas, and in the 20 or 30 years ending with 1842 there had been five dynastic revolutions. The most prominent character in the history was a certain Gaur Rahman or Gauhar Aman, chief of Yasin, a cruel savage and man-seller, of whom many evil deeds are told. Being remonstrated with for selling a mulhall, he said, "Why not? The Koran, the word of God, is sold; why not sell the expounder thereof?" The Sikhs entered Gilgit about 1842, and kept a garrison there. When Kashmir was made over to Maharaja Gulab Singh of Jammu in 1846, and Lord Hardinge, the Gilgit claims were transferred with it. And when a commission was sent to lay down boundaries of the tracts made over, Mr. Vans Agnew (afterwards murdered at Multan) and Lieut. Ralph Young of the Engineers visited Gilgit, the first Englishmen who did so. The Dogras (Gulab Singh's race) had much ado to hold their ground, and in 1852 a catastrophe occurred, parallel on a smaller scale to that of the English troops at Kabul. Nearly 2000 men of theirs were exterminated by Gaur Rahman and a combination of the Dards; only one person, a soldier's wife, escaped, and the Dogras were driven away for eight years. Gulab Singh would not again cross the Indus, but after his death (in 1857) Maharaja Ranbir Singh longed to recover lost prestige. In 1860 he sent a force into Gilgit. Gaur Rahman just then died, and there was little resistance. The Dogras after that took Yasin twice, but did not hold it. They also, in 1866, invaded Darel, one of the most secluded Dard states, to the south of the Gilgit basin, but withdrew again. In 1889, in order to guard against the advance of Russia, the British government, acting as the suzerain power of Kashmir, established the Gilgit agency; in 1901, on the formation of the North-West Frontier province, the rearrangement was made as stated above.

GILL, JOHN (1697-1771), English Nonconformist divine, was born at Kettering, Northamptonshire. His parents were poor and he owed his education chiefly to his own perseverance. In November 1716 he was baptized and began to preach at Higham Ferrers and Kettering, until the beginning of 1719, when he became pastor of the Baptist congregation at Horley, in the West Sussex, where he continued until 1757, when he was removed to a chapel near London Bridge. From 1727 to 1757 he was Wednesday evening lecturer in Great Eastcheap. In 1748 he received the degree of D.D. from the university of Aberdeen. He died at Camberwell on the 14th of October 1771. Gill was a great Hebrew scholar, and in his theology a sturdy Calvinist.

His principal works are Exposition of the Song of Solomon (1725); The Propheties of the Old Testament respecting the Messiah (1726); The Doctrine of the Trinity (1731); The Cause of God and Truth (4 vols., 1731); Exposition of the Bible, in 10 vols. (1745-1767), in preparing which he formed a large collection of Hebrew and Rabbinical books and MSS. The Antiquities of Bible Language—Letters, Vowel Points, and Accents (1759); A Body of Doctrinal Divinity (1767); A Book of Practical Divinity (1770); and Sermons and Tracts, with a memoir of his life (1775). An edition of his Exposition of the Bible appeared in 1816 with a memoir by John Rippon, which has also appeared separately.

GILL. (1) One of the branchiae which form the breathing apparatus of fishes and other animals that live in the water. The word is also applied to the branchiæ of some kinds of worm and arachnids, and by transference to objects resembling the branchiæ of fishes, such as the waffles of a fowl, or the radiating films on the under side of fungi. The word is of obscure origin. Danish has gisleæ, and Swedish gill with the same meaning. But it is curious that it has no other modern form. If this be correct, the word will be in origin the same as "gill," often spelled "ghyll," meaning a Glenn or ravine, common in northern English dialects and also in Kent and Surrey. The g in both these words is hard. (2) A liquid measure usually holding
GILLES DE ROYE—GILLIE

one-fourth of a pint. The word comes through the O. Fr. gille, from Low Lat. gello or gille, a measure for wine. It is thus connected with "gallon." The g is soft. (3) An abbreviation of the feminine name Gillian, also often spelled Jill, as it is pronounced. Like Jack for a boy, with which it is often coupled, as in the nursery rhyme, it is used as a homely generic name for a girl.

GILLES DE ROYE, or EGIDIUS DE ROYA (d. 1478), Flemish chronicler, was born probably at Montdidier, and became a Cistercian monk. He was afterwards professor of theology in Paris and abbot of the monastery of Royaumont at Amières-sur-Oise, retiring about 1458 to the convent of Notre Dame des Duresses, near Furnes, and devoting his time to study. Gilles wrote the Chronicon Dunense or Annales Belgici, a résumé and continuation of the work of another monk, Jean Brandon (d. 1428), which deals with the history of Flanders, and also with events in Germany, Italy and England from 702 to 1478.

The Chronicle was published by F. R. Sweet in the Rerum Belgicorum annales (Frankfort, 1600); and the earlier part of it by C. B. Kervyn de Lettenhove in the Chroniques relatives à l'histoire de la Belgique (Brussels, 1870).

GILLES LI MUISIS, or LE MUSSET (c. 1727-1752), French chronicler, was born probably at Tournai, and in 1789 entered the Benedictine abbey of St Martin in his native city, becoming prior of this house in 1737, and abbot four years later. He only secured the latter position after a contest with a competitor, but he appears to have been a wise ruler of the abbey. Gilles wrote two Latin chronicles, Chronicon majus and Chronicon minus, dealing with the history of the world from the creation until 1349. This work, which was continued by another writer to 1352, is valuable for the history of northern France, and Flanders during the first half of the 14th century. It is published by J. J. de Senet in the Corpus chroniorum Hiberniae, tome ii. (Brussels, 1845). Gilles also wrote some French poems, and these Poésies de Gilles li Muisis have been published by Baron Kervyn de Lettenhove (Louvain, 1852).

GILLESPIE, GEORGE (1613-1648), Scottish divine, was born at Kirkcaldy, where his father, John Gillespie, was parish minister, on the 21st of January 1613, and entered the university of St Andrews as a "presbytery bursar" in 1639. On the completion of a brilliant student career, he became domestic chaplain to John Gordon, 1st Viscount Kenmure (d. 1634), and afterwards to John Kennedy, earl of Cassillis, his conscience not permitting him to accept the episcopal ordination which was at that time in Scotland an indispensable condition of induction to a parish. While with the earl of Cassillis he wrote his first work, A Vindication Against the English Popish Ceremonies observed near Fumuse, a sermon preached at Northampton, where he received ordination in January 1641. In September of the same year he was admitted minister of the parish of Carnock, Fife, the presbytery of Dunfermline agreeing not only to sustain as valid the ordination which he had received in England, but also to allow a qualification of his subscription to the church's doctrinal symbol, so far as it had reference to the sphere of the civil magistrate in matters of religion. Having on conscientious grounds persistently absented himself from the meetings of presbytery held for the purpose of ordaining one John Richardson, as a respectable presbyter, minister of Inverkeithing, he was, after an unobtrusive but useful ministry of ten years, deposed by the Assembly of 1732 for maintaining that the refusal of the local presbytery to act in this case was justified. He continued, however, to preach, first at Carnock, and afterwards in Dunfermline, where a large congregation gathered round him. His conduct under the sentence of deposition produced a reaction in his favour, and an effort was made to have him reinstated; this he declined unless the policy of the church were reversed. In 1765, in conjunction with Thomas Boston of Jedburgh and Collier of Colinsburgh, he formed a distinct communion under the name of "The Presbytery of Relief,"—relief, that is to say, "from the yoke of patronage and the tyranny of the church courts." The Relief Church eventually became one of the communions combining to form the United Presbyterian Church. He died on the 10th of January 1774. His only literary efforts were an Essay on the Continuation of Immediate Revelations in the Church, and a Practical Treatise on the Holy Eucharist. Both works were printed posthumously; in the former he argues that immediate revelations are no longer vouchsafed to the church, in the latter he traces temptation to the work of a personal devil.

See Lindsay's Life and Times of the Rev. Thomas Gillespie; Smethers's History of the Relief Church; for the Relief Church see UNITED PRESBYTERIAN.

GILLIE (from the Gael. gille, Irish gille or gioita, a servant or boy), an attendant on a Gaelic chieftain; in this sense its use, save historically, is rare. The name is now applied in the Highlands of Scotland to the man-servant who attends a sportsman in shooting or fishing. A gille-wetfoot, a term now obsolete (a translation of gille-cas-fhlinn, from the Gaelic cas, foot, and especially of his encounter, with John Selden on Matt. xviii. 15-17. In 1645 he returned to Scotland, and is said to have drawn the act of assembly sanctioning the directory of public worship. On his return to London he had a hand in drafting the Westminster confession of faith, especially chap. i. Gillespie was elected moderator of the Assembly in 1648, but the laborious duties of that office (the court continued to sit from the 12th of July to the 12th of August) told fatally on an overtaxed constitution; he fell into consumption, and, after many weeks of great weakness, he died at Kirkcaldy on the 17th of December 1649. In acknowledgment of his great zeal and character, of 35000 Scots was voted, though destined never to be paid, to his widow and children by the committee of estates. A simple tombstone, which had been erected to his memory in Kirkcaldy parish church, was in 1661 publicly broken at the cross by the hand of the common hangman, but was restored in 1746.

His principal publications were controversial and chiefly against Erastianism: Three sermons against Thomas Coleman; A Sermon before the House of Lords (August 27th), on Matt. iii. 2, Nihil Respondem and Male Audis; Aaron's Rod Blossoming, or the Divine Omnipotence of Church-government vindicated (1646), which is deservedly regarded as a remarkable statement of the case for an exclusive spiritual jurisdiction in the church; One Hundred and Eleven Propositions concerning the Ministry and Government of the Church (1646), the following were published by his brother: A Treatise of Miscellany Questions (1649); The Ark of the New Testament (2 vols., 1661-1667); Notes of Debates and Proceedings of the Assembly of Divines at Westminster, from February 26th to January 17th, 1644-46. See Works, with memoir, published by Hetherington (Edinburgh, 1843-1846).

GILLESPIE, THOMAS (1708-1774), Scottish divine, was born at Clearburn, in the parish of Duddingston, Midlothian, in 1708. He was educated at the university of Edinburgh, and studied divinity first at a small theological seminary at Perth, and afterwards for a brief period under Philip Doddridge at Northampton, where he received ordination in January 1741. In September of the same year he was admitted minister of the parish of Carnock, Fife, the presbytery of Dunfermline agreeing not only to sustain as valid the ordination which he had received in England, but also to allow a qualification of his subscription to the church's doctrinal symbol, so far as it had reference to the sphere of the civil magistrate in matters of religion. Having on conscientious grounds persistently absented himself from the meetings of presbytery held for the purpose of ordaining one John Richardson, as a respectable presbyter, minister of Inverkeithing, he was, after an unobtrusive but useful ministry of ten years, deposed by the Assembly of 1752 for maintaining that the refusal of the local presbytery to act in this case was justified. He continued, however, to preach, first at Carnock, and afterwards in Dunfermline, where a large congregation gathered round him. His conduct under the sentence of deposition produced a reaction in his favour, and an effort was made to have him reinstated; this he declined unless the policy of the church were reversed. In 1765, in conjunction with Thomas Boston of Jedburgh and Collier of Colinsburgh, he formed a distinct communion under the name of "The Presbytery of Relief,"—relief, that is to say, "from the yoke of patronage and the tyranny of the church courts." The Relief Church eventually became one of the communions combining to form the United Presbyterian Church. He died on the 10th of January 1774. His only literary efforts were an Essay on the Continuation of Immediate Revelations in the Church, and a Practical Treatise on the Holy Eucharist. Both works were printed posthumously; in the former he argues that immediate revelations are no longer vouchsafed to the church, in the latter he traces temptation to the work of a personal devil.

flinch, wet), was the gillie whose duty it was to carry his master over streams. It became a term of contempt among the Lowlanders for the "tall" (as his attendants were called) of a Highland chief.

**GILLIES, JOHN** (1747-1836), Scottish historian and classical scholar, was born at Brechin, in Forfarshire, on the 18th of January 1747. He was educated at Glasgow University, where, at the age of twenty, he acted for a short time as substitute for the professor of Greek. In 1784 he completed his _History of Ancient Greece, its Colonies and Conquests_ (published 1786). This work, valuable at a time when the study of Greek history was in its infancy, and translated into French and German, was written from a strong Whig bias, and is now entirely superseded by modern works ("see Authorities"). On the death of William Robertson (1721-1793), Gillies was appointed historiographer-royal for Scotland. In his old age he retired to Clapham, where he died on the 15th of February 1836.

Of his other works, none of which are much read, the principal are: _View of the Reign of Frederic II. of Prussia, with a Parallel between that of Frangep and Philip II. of Macedon_ (1779); _A Polite Enquiry on the Nobility of the Romans_ (1782); _A Comparative View of the History of Grecian and Roman Virtue_ (1783); _Eloquence and Tyranny_ (1784); _An Essay on Greek Poetry_ (1785); _An Essay on the Reformation of Morals_ (1787); _An Essay on the History of the Roman Empire_ (1788); _An Essay on the History of the Grecian and Roman Empires_ (1789); _An Essay on the History of the Indian Manners and Customs_ (1790); _An Essay on the History of the Indian Manners and Customs_ (1791); and _An Essay on the History of the Indian Manners and Customs_ (1792). These works, and others written after them, are characterized by a close attention to detail and a critical approach to history. Gillies was a keen observer and a skilled writer, and his works are still studied by historians today.

**GILLINGHAM,** a market town in the northern parliamentary division of Dorsetshire, England, 105 m. W.S.W. from London by the London & South-Western railway. Pop. (1901) 3380. The church of St Mary the Virgin has a Decorated chancel. There is a large agricultural trade, and manufactures of bricks and tiles, cord, sacking and silk, brewing and bacon-currying are carried on. The rich undulating district in which Gillingham is situated was a forest preserved by King John and his successors, and the site of their lodge is traceable near the town.

**GILLINGHAM,** a municipal borough of Kent, England, in the parliamentary borough of Chatham and the mid-division of the county, on the Medway immediately east of Chatham, on the South-Eastern & Chatham railway. Pop. (1891) 27,800; (1901) 42,530. Its population is largely industrial, employed in the Chatham dockyards, and in cement and brick works in the neighbourhood. The church of St Mary Magdalene ranges in date from Early English to Perpendicular, retaining also traces of Norman work and some early brasses. A great battle between Edmund Ironside and Canute, c. 1016, is placed here; and there was formerly a palace of the archbishops of Canterbury. Gillingham was incorporated in 1893, and is governed by a mayor, 6 aldermen and 18 councillors. The borough includes the populous districts of Brompton and New Brompton. Area, 4355 acres.

**GILLOT, CLAUDE** (1673-1722), French painter, best known as the master of Watteau and Lancret, was born at Langres. His sportive mythological landscape pieces, with such titles as "Feast of Pan" and "Feast of Bacchus," opened the Academy of Painting at Paris to him in 1715; and he then adapted his art to the fashionable tastes of the day, and introduced the decorative _fîtes champêtres_, in which he was afterwards surpassed by his pupils. He was also closely connected with the opera and theatre as a designer of scenery and costumes.

**GILLOT, JOSEPH** (1790-1873), English pen-maker, was born at Sheffield on the 11th of October 1799. For some time he was a working cutter there, but in 1821 removed to Birmingham, where he found employment in the "steel toy" trade, the technical name for the manufacture of steel buckles, chains and light ornamental steel-work generally. About 1830 he turned his attention to the manufacture of steel pens by machinery, and in 1851 patented a process for placing elongated points on the nibs of pens. Subsequently he invented other improvements, getting rid of the hardness and lack of flexibility, which had been a serious defect in nibs, by cutting, in addition to the centre slit, side slits, and cross grinding the points. By 1859 he had built up a very large business. GIlott was a liberal art-patron, and one of the first to subscribe for the "Designs of M. W. Turner." He died at Birmingham on the 5th of January 1873. His collection of pictures, sold after his death, realized £170,000.

**GILLOW, ROBERT** (d. 1773), the founder at Lancaster of a distinguished firm of English cabinet-makers and furniture designers whose business began in 1731. He was the son of Richard (1717-1817), who after being educated at the Roman Catholic seminary at Douai was taken into partnership about 1757, when the firm became Gillow & Barton, and his younger sons Robert and Thomas, and the business was continued by his grandson Richard (1778-1866). In its early days the firm of Gillow were architects as well as cabinet-makers, and the first Richard Gillow designed the classical Custom House at Lancaster. In the middle of the 18th century the business was extended to London, and about 1761 premises were opened in Oxford Street (1781), which was continuously occupied until 1826. For a long period the Gillows were the best-known makers of English furniture—Sherraton and Hepplewhite both designed for them, and replicas are still made of pieces from the drawings of Robert Adam. Between 1760 and 1770 they invented the original form of the hilliard-table; they were the patentees (about 1800) of the telescopic dining-table which has long been universal in English houses; for a Captain Davenport they made, if they did not invent, the first writing-table of that name. Their vogue is indicated by references to them in the works of Jane Austen, Thackeray, and the earlier novelists, and more recently in one of Gilbert and Sullivan's comic operas.

**GILLRAY, JAMES** (1757-1815), English caricaturist, was born at Chelsea in 1757. His father, a native of Lanark, had served as a soldier, losing an arm at Fontenoy, and was admitted first as an inmate, and afterwards as an outdoor pensioner, at Chelsea Hospital. Gillray commenced life by learning letter-engraving, in which he soon became an adept. This employment, however, proving irksome, he wandered about for a time with a company of strolling players. After a very chequered experience he returned to London, and was admitted a student in the Royal Academy, supporting himself by engraving, and probably issuing a considerable number of caricatures under fictitious names. Hogarth's works were the delight and study of his early years. "Paddy on Horseback," which appeared in 1770, is the first caricature which is certainly his. Two caricatures on Rodney's naval victory, issued in 1782, were among the first of the memorable series of his political sketches. The name of Gillray's publisher and printseller, Miss Humphrey—whose shop was first at 227 Strand, then in New Bond Street, then in Old Bond Street, and finally in St James's Street—is inextricably associated with that of the caricaturist. Gillray lived with Miss (often called Mrs) Humphrey during all the period of his fame. It is believed that he several times thought of marrying her, and that on one occasion the pair were on their way to the church, when Gillray said: "This is a foolish affair, methinks, Miss Humphrey. We live very comfortably together; we had better let well alone." There is no evidence, however, to support the stories which scandalmongers invented about their relations. Gillray's plates were exposed in Humphrey's shop window, where eager crowds examined them. A number of his most trenchant satires are directed against George III., who, after examining some of Gillray's sketches, said, with characteristic ignorance and blindness to merit, "I don't understand these caricatures." Gillray revenged himself for this utterance by his splendid caricature entitled, "A Connoisseur Examining a Cooper," which he is doing by means of a candle on a "save-all"; so that the sketch satirizes at once the king's pretensions to knowledge of art and his miseries.

The excesses of the French Revolution made Gillray conservative; and he issued caricature after caricature, ridiculing the French and Napoleon, and glorifying John Bull. He is not, however, to be thought of as a keen political adherent of either the Whig or the Tory party; he dealt his blows pretty freely all round. His last work, from a design by Bunbury, is entitled "Interior of a Barber's Shop in Assize Time," and is dated 1811. While he was engaged on it he became mad, although he had occasional intervals of sanity, which he employed on his last work. The approach of madness must have been hastened by his intemperate habits. Gillray died on
GILLYFLOWER—GILMAN

the 1st of June 1815, and was buried in St James's churchyard, Piccadilly.

The times in which Gillray lived were peculiarly favourable to the growth of a great school of caricature. Party warfare was carried on with great vigour for and against a little bitterminded, and political cant was inked in on both sides. Gillray's incomparable wit and humour, knowledge of life, fertility of resource, keen sense of the ludicrous, and beauty of execution, at once gave him the first place among caricaturists. He is honourably distinguished in the history of caricature by the fact that his sketches are real works of art. The ideas embodied in some of them are sublime and poetically magnificent in their intensity of meaning; while the coarseness by which others are disfigured is to be explained by the general freedom of treatment common in all intellectual departments in the 18th century.

The historical value of Gillray's work has been recognized by accurate students of history. As has been well remarked: "Lord Stanhope has turned Gillray to account as a veracious reporter of speeches, as well as a suggestive illustrator of events." His contemporary political influence is borne witness to in a letter from Lord Bateman, dated November 3, 1798. "The Opposition," he writes to Gillray, "are as low as we can wish them. You have been of infinite service in lowering them, and making them ridiculous." Gillray's extraordinary industry may be inferred from the fact that caricatures have been ascribed to him; while some consider him the author of 1600 or 1700. He is invaluable to the student of English manners as well as to the political student. He attacks the social follies of the time with satirizing satire; and nothing escapes his notice, not even a trifling change in fashion in dress. The great tact Gillray displays in hitting on the ludicrous side of any subject is only equaled by the exquisite finish of his sketches—the finest of which reach an epic grandeur and Miltonic sublimity of conception.

Gillray's caricatures are divided into two classes, the political series and the social. The political caricatures form really the best history extant of the latter part of the reign of George III. They were circulated not only over Britain but throughout Europe, and exerted a powerful influence. In this series, George III., the queen, the prince of Wales, Fox, Pitt, Burke and Napoleon are the most prominent figures. In 1788 appeared two fine caricatures by Gillray, "Blood on Thunder forging the Red Sea" represents Lord Thurlow carrying Warren Hastings through a sea of gore: Hastings looks very comfortable, and is carrying two large bags of money. "Market-Day" pictures the ministerialists of the time as honest card cabbies, and the honest sitters or committees are: "Farmer George and his Wife," two companion plates, in one of which the king is dressing muffins for breakfast, and in the other the king is making puddings, where the king proposes to dispense with sugar, to the great horror of the family; "A Connoisseur Examining a Cooper," "Temperance enjoying a Frugal Meal," "Royal Affability," "A Lesson in Art," "Begone the Gillyflower," and "The Fugitive. Among his other important political caricatures may be mentioned: "Britannia between Scylla and Charybdis," a picture in which Pitt, so often Gillray's butt, figures in a favourable light; "The Bridal Night"; "The Apotheosis of Hoche," which concentrates the excesses of the French Revolution in one view; "The Nursery with Britannia reposing in Peace"; "The First Kiss these Ten Years" (1803), another satire on the peace, which is said to have greatly amused Napoleon; "The Handwriting upon the Wall;" "The Confederated Coalition," a fling at the coalition which superseded the Addison ministry; "The Old Sherry," "The Plum-Pudding in Danger," "Making Decent," i.e., "Broad-bottoms getting into the Grand Costume;" "Comforts of a Bed of Roses;" "View of the Hastings in Covent Garden;" "Phæthon Alarmed;" and "Pandora opening her Box." The miscellaneous series of caricatures, although they have scarcely the historical importance of the political series, are more readily intelligible, and are even more amusing. Among the best are: "Shakespeare Sacrifized," "Grenville Chimes" (two plates); "Two Penny Whist;" "Oh! that this solid flesh would melt!"; "Sandwich Carrots;" "The Gout;" "Comfort to the Cows;" "Begone Dull Care;" "The Cow-Pock," which describes the effect of the cowpox; "The Groats, the Dish of various;" "Dillenius Theatricals;" and "Harmony before Matrimony" and "Matrimonial Harmonies"—two exceedingly good sketches in which Gillray was still better.

A selection of Gillray's works appeared in parts in 1818; but the first good edition was Thomas M'Lean's, which was published, with a key, in 1830. A somewhat bitter attack, not only on Gillray's character, but even on his genius, appeared in the Athenaeum for October 1, 1831, which was successfully refuted by J. Landseer in "Austen'sium" a few pages after. In 1851 Henry G. Bohn put out an edition, from the original plates, in a handsome folio, following the engravings and caricatures being published in a separate volume. For this edition Thomas Wright and R. H. Evans wrote a valuable commentary, which is a good edition of Gillray's caricatures. The next edition, entitled The Works of James Gillray, the Caricaturist: with the Story of his Life and Times (Chatto & Windus, 1874), was the work of Thomas Wright, and, by its popular excellence and narrative interest, carried Gillray to a very large circle of readers, otherwise ignorant of him. This edition, which is complete in one volume, contains two portraits of Gillray, and upwards of 400 illustrations. Mr. J. G. Robertson, in a letter to the Academy (Feb. 28, 1874), drew attention to the existence of a MS. volume, in the British Museum, containing letters to and from Gillray, and other illustrative documents. The extracts he gave were used in a valuable article in the Quarterly Review for April 1874. See also the Academy for Feb. 21 and May 16, 1874.

There is a good account of Gillray in Wright's History of Caricature and Grotesque in Literature and Art (1865). See also the article Caricature.

**GILLYFLOWER**, a popular name applied to various flowers, but principally to the clove, *Dianthus Caryophyllus*, of which the carnation is a cultivated variety, and to the stock, *Matthiola incana*, a well-known garden favourite. The word is sometimes written gillyflower or gilliflower, and is reputedly a corruption of July-flower, "so called from the month they blow in." Henry Phillips (1753-1818), and W. and H. D'Urville (1568) "calls it gillower, to which he adds the word stock, as we would say gaoliers that grow on a stem or stock, to distinguish them from the clove-gelowers and the wall-gelowers. Gerard, who succeeded Turner, and after him Parkinson, calls it gilliflower, and thus it travelled from its original orthography until it was called July-flower by those who knew not whence it was derived." Dr Prior, in his useful volume on the Popular Names of British Plants, very distinctly shows the origin of the name. He considers that it "formerly spelt gilfower and gilfoilow, with the o long, from the French girofle, Italian girofalo (M. Lat. garofolum), corrupted from the Latin Caryophyllus, and referring to the spicy odour of the flower, which seems to have been used in flavouring wine and other liquors to replace the more costly clove of India. The name was originally given in Italy to plants of the pink tribe, especially the carnation, but has in England been transferred of late years to several cruciferous plants." The gillyflower of Clauier and Spenser and Shakespeare was, as in Italy, *Dianthus Caryophyllus*; that of later writers and gardeners, *Matthiola*. Much of the confusion in the name arises from the plants having doubtless arisen from the vague use of the French term girofle, aillet and violette, which were all applied to flowers of the pink tribe, but in England were subsequently extended and finally restricted to very different plants. The use made of the flowers to impart a spicy flavour to ale and wine is alluded to by Clauier, who writes:

And many a clove gilflower
To put in ale;"

also by Spenser, who refers to them by the name of sops in wine, which was applied in consequence of their being steeped in the liquor. In both these cases, however, it is the clove-gillyflower which is intended, as it is also in the passage from Gerard, in which he states that the conserve made of the flowers with sugar "is exceeding cordial, and wonderfully both comfort the heart, being eaten now and then." The principal other plants which bear the name are the wallflower, *Cheiranthus Cheiri*, called wall-gillyflower in old books; the dame's violet, *Hesperis matronalis*, called variously the queen's, the rogue's and the winter gillyflower; the ragged-robins, *Lychins Flous-cuculi*, called marsh-gillyflower and cuckoo-gillyflower; the water-violet, *Hottonia palustris*, called water-gillyflower; and the thrift, *Armeria vulgaris*, called sea-gillyflower. As a separate designation it is nowadays usually applied to the wallflower.

**GILMAN, DANIEL COIT** (1831-1908), American educationist, was born in Norwich, Connecticut, on the 6th of July 1831. He graduated at Yale in 1852, studied in Berlin, was assistant librarian of Yale in 1856-1858 and librarian in 1858-1865, and was professor of physical and political geography in the Sheffield Scientific School of Yale University and a member of the
GILMORE—GILPIN

25

Governing Board of this School in 1863–1872. From 1856 to 1860 he was a member of the school board of New Haven, and from August 1865 to January 1867 secretary of the Connecticut Board of Education. In 1872 he became president of the University of California at Berkeley. On 5th July, 1874 he was elected first president of Johns Hopkins University (q.v.) at Baltimore. He entered upon his duties on the 1st of May 1875, and was formally inaugurated on the 22nd of February 1876. This post he filled until 1901. From 1901 to 1904 he was the first president of the Carnegie Institution at Washington, D.C. He died at Norwich, Conn., on the 13th of October 1908. He received the honorary degree of LL.D. from Harvard, St John’s, Columbia, Yale, North Carolina, Princeton, Toronto, Wisconsin and Clark Universities, and William and Mary College. His influence upon higher education in America was great, especially at Johns Hopkins, where many wise details of administration, the plan of bringing to the university as lecturers for a part of the year scholars from other colleges, the choice of a singularly brilliant and able faculty, and the marked willingness to recognize workers in new branches of science were all largely due to him. To the organization of the Johns Hopkins hospital, of which he was made director in 1889, he contributed greatly. He was a singularly good judge of men and an able administrator, and the influence which he exercised had an immense influence, especially in the promotion of original and productive research. He was always deeply interested in the researches of the professors at Johns Hopkins, and it has been said of him that his attention as president was turned inside and not outside the university. He was instrumental in determining the policy of the Sheffield Scientific School of Yale University while he was a member of its governing board; on the 28th of October 1897 he delivered at New Haven a semi-centennial discourse on the school, which appears in his University Problems. He was a prominent member of the American Archaeological Society and of the American Oriental Society; was one of the original trustees of the John F. Slater Fund (for a time he was secretary, and from 1893 until his death was president of the board); from 1891 until his death was a trustee of the Peabody Educational Fund (being the vice-president of the board); and was an original member of the General Education Board (1902) and a trustee of the Russell Sage Foundation for Social Betterment (1907). In 1896–1897 he served on the Venezuela Boundary Commission appointed by President Cleveland. In 1900 he succeeded Carl Schurz as president of the National Civil Service Reform League and served until 1907. Some of his papers and addresses are collected in a volume entitled University Problems in the United States (1888). He wrote, besides, James Monroe (1883), in the American Statesmen Series; A Life of James D. Dana, the geologist (1899); Science and Letters at Yale (1901), and The Launching of a University (1906), an account of the early years of Johns Hopkins.

GILMORE, PATRICK SARSFIELD (1859–1892), American bandmaster, was born in Ireland, and settled in America about 1850. He had been in the band of an Irish regiment, and he had great success as leader of a military band at Salem, Massachusetts, and subsequently (1859) in Boston. He increased his reputation during the Civil War, particularly by organizing a monster orchestra of massed bands for a festival at New Orleans in 1864; and at Boston in 1866 and 1872 he gave similar performances. He was enormously popular as a bandmaster, and composed or arranged a large variety of pieces for orchestra. He died at St Louis on the 24th of September 1892.

GILPIN, BERNARD (1517–1583), the “Apostle of the North,” was descended from a Westmoreland family, and was born at Kentmere in 1517. He was educated at Queen’s College, Oxford, graduating B.A. in 1540, M.A. in 1542 and B.D. in 1549. He was elected fellow of Queen’s and ordained in 1542; subsequently he was elected student of Christ Church. At Oxford he first adhered to the conservative side, and defended the doctrines of the church against Hooper; but his confidence was somewhat shaken by another public disputation which he had with Peter Martyr. In 1552 he preached before King Edward VI. a sermon on sacrifice, which was duly published, and displays the high ideal which even then he had formed of the clerical office; and about the same time he was presented to the vicarage of Norton, in the diocese of Durham, and obtained a licence, through the influence of William Cecil, to preach in that parish for as long as the king lived. On Mary’s accession he went abroad to pursue his theological investigations at Louvain, Antwerp and Paris; and from a letter of his own, dated Louvain, 1554, we get a glimpse of the quiet student rejoicing in an “excellent library belonging to a monastery of Minorites.” Returning to England towards the close of Queen Mary’s reign, he was invested by his mother’s uncle, Tunstall, bishop of Durham, with the archdeaconry of Durham, to which the rectory of Easington was annexed. The enclosure of the fishponds, which especially the clerical vices, of his times excited hostility against him, and he was formally brought before the bishop on a charge consisting of thirteen articles. Tunstall, however, not only dismissed the case, but presented the offender with the rich living of Houghton-le-Spring; and when the accusation was again brought forward, he again protected him. Enraged at this defeat, Gilpin’s enemies laid their complaint before Bonner, bishop of London, who secured a royal warrant for his apprehension. Upon this Gilpin prepared for martyrdom; and, having ordered his house-steward to provide him with a long garment that he might “goe the more comely to the stake,” he set out for London. Fortunately, however, for him, he broke his leg on the journey, and his arrival was thus delayed till the news of Queen Mary’s death freed him from further danger. He at once returned to Houghton, and there he continued to labour till his death on the 4th of March 1583. When the Roman Catholic bishops were deprived he was offered the see of Carlisle; but he declined this honour and also the provostship of Queen’s, William Cecil’s general preaching throughout the kingdom and the example of his action. All this was a ceaseless round of benevolent and energetic work. In June 1560 he entertained Cecil and Dr Nicholas Wotton on their way to Edinburgh. His hospitable manner of living was the admiration of all. His living was a comparatively rich one, his house was better than many bishops’ palaces, and his position was that of a clerical magnate. In his household he spent “every fortnight 40 bushels of corn, 20 bushels of malt and an ox, besides a proportional quantity of other kinds of provisions.” Strangers and travellers found a ready reception; and even their horses were treated with so much care that it was humorously said that, if one were turned loose in any part of the country, it would immediately make its way to the rector of Houghton. Every Sunday from Michaelmas till Easter was a public day with Gilpin. For the reception of his parishioners he had three tables well covered—one for gentlemen, the second for husbandmen, the third for day-labourers; and this piece of hospitality he never omitted, even when losses or scarcity made its continuance difficult. He built and endowed a grammar-school at a cost of upwards of £500, educated and maintained a large number of poor children at his own charge, and provided the most promising pupils with means of studying at the universities. So many young people, indeed, flocked to his school that there was not accommodation for them in Houghton, and he had to fit up part of his house as a boarding establishment. Grieved at the ignorance and superstition which the remissness of the clergy permitted to flourish in the neighbouring parishes, he used every year to visit the most neglected parts of Northumberland, Yorkshire, Cheshire, Westmorland and Cumberland; and that his own flock might not suffer, he was at the expense of a constant assistant. Among his parishioners he was looked up to as a judge, and did great service in preventing law-suits amongst them. If an industrious man suffered a loss, he delighted to make it good; if the harvest was bad, he was liberal in the remission of tithes. The boldness which he could display at need was well illustrated by his action in regard to duelling. Finding one day a challenge-glove stuck up on the door of a church where he was to preach, he took it down with his own hand, and proceeded to the pulpit to inveigh against the unchristian custom. His theological position was not in accord with any of
the religious parties of his age, and Gladstone thought that the
church was better exemplified in, his career than in those of more prominent ecclesiastics
(pref. to A. W. Hutton's edition of S. R. Maitland's Essays on the
Reformation). He was not satisfied with the Elizabethan
settlement, it had great respect for the Fathers, and was with
difficulty induced to issue a Catholic settlement. He confessed
his unorthodoxy but held him; but on the other hand he main-
tained friendly relations with Bishop Fulkington and Thomas
Lever, and the Puritans had some hope of his support.
A life of Bernard Gilpin, written by George Carleton, bishop of
Chichester, who had been a pupil of Gilpin's at Houghton, will be
found in the Life and Letters of Bishop Berkeley (1681).
A translation of this sketch by William Freake, minister,
was published at London, 1629; and in 1835 it was reprinted in
Glasgow, with an introductory essay by Edward Irving. It forms
one of the lives in Christopher Wordsworth's Ecclesiastical Biography
(vol. iii., 4th ed.), having been compared with Carleton's Latin
text. Another biography of Gilpin, which, however, adds little to
Bishop Carleton's, was written by William Gilpin, M.A., prebendary
GILSONITE (so named after S. H. Gilson of Salt Lake City),
or Uintaite, or Uintaite, a description of asphalt occurring in
masses several inches in diameter in the Uinta (or Uintah)
valley, near Fort Duchesne, Utah. It is black of colour; its
fracture is conchoidal, and it has a lustrous surface. When
warmed it becomes plastic, and on further heating fusces perfectly.
It has a specific gravity of 1.65 to 1.70. It dissolves freely
in hot oil of turpentine. The output amounted to 19,016 short
tons for the year 1905, and the value was $4.31 per ton.
GILYAKS, a hybrid people, originally widespread throughout
the Lower Amur district, but now confined to the Amur delta
and the north of Sakhalin. They have been affiliated by some
authorities to the Ainu of Sakhalin and Yezo; but they are more
probably a mongrel people, and Dr A. Anuchin states that
there are two types, a Mongoloid with sparse beard, high-check
borne skull, and thin ailing limbs, and a diminutive with
bushy beard and more regular features. The Chinese call them
Yupilats, "Fish-skink clad people," from their wearing a peculiar dress made from
salmon skin.
See E. G. Ravenstein, The Russians on the Amur (1861); Dr A.
Anuchin, Mem. Imp. Soc. Nat. Sx., Supplement (Moscow, 1871); H.
von Siebold, Über die Aino (Berlin, 1881); J. Deniker in Revue
d'ethnographie (Paris, 1884); L. Schrenck, Die Völker des Amur
landes (St Petersburg, 1891).
GIMBAL, a mechanical device for hanging some object so
that it should keep a horizontal and constant position, while
the body from which it is suspended is in free motion, so that
the motion of the supporting body is not communicated to it.
It is thus used particularly for the suspension of compasses or
chronometers and lamps at sea, and usually consists of a ring
freely moving on an axis, within which the object swings on an
axis at right angles to the ring.
The word is derived from the O. Fr. gemel, from Lat. gemellus,
diminutive of geminus, a twin, and appears also in gimel or
jimbel and as gemel, especially as a term for a ring formed of
two hoops linked together and capable of separation, used in
the 16th and 17th centuries as betrothal and keepsake rings. They
sometimes were made of three or more hoops linked together.
GIMLET (from the O. Fr. guiemelet, probably a diminutive of
the O.E. wimple, and the Scandinavian wammle, to bore or
twist; the modern French is gibelet), a tool used for boring small
holes. It is made of steel, with a shaft having a hollow side,
and a screw at the end for boring the wood; the handle of wood
is fixed transversely to the shaft. A gimlet is always a small
tool. A similar tool of large size is called an "auger" (see
Tools).
GIMLI, in Scandinavian mythology, the great hall of heaven
whither the righteous will go to spend eternity.
GIMP, or GYM. (1) (Of somewhat doubtful origin, but prob-
ably a nasal form of the Fr. guipure, from guioper, to cover or
"whip" a cord over with silk), a stiff trimming made of silk
or cotton woven around a firm cord, often further ornamented
by a metal cord running through it. It is also sometimes
covered with bugles, beads or other glistening ornaments. The
trimming employed by upholsterers to edge curtains, draperies,
the seats of chairs, &c., is also called gimp; and in lace work
it is the firmer or coarser thread which outlines the pattern and
strengthens the material. (2) A shortened form of gimble (the
O.E. wimple), the kerchief worn by a nun around her throat,
sometimes also applied to a nun's stomach.
Gin is a distilled spirit of the juniper berry, the charac-
teristic flavour of which is derived from the juniper berry.
The word "gin" is an abbreviation of Geneva, both being primarily
derived from the Fr. genevière (juniper). The use of the
juniper for flavouring alcoholic beverages may be traced to
the invention, or perfecting, by Count de Morret, son of
Henry IV. of France, of juniper wine. It was the custom in the early
days of the spirit industry, in distilling spirit from fermented
liquors, to add in the working some aromatic ingredients, such
as Juniper (Juniperus communis), to take off the nauseous
flavour of the crude spirits then made. The invention of juniper
wine, no doubt, led some one to try the juniper berry for this
purpose, and as this flavouring agent was found not only to
yield a agreeable beverage, but also to impart a valuable
medicinal quality to the spirit, it was generally made use of by
makers of aromatised spirits thereafter. It is probable that the
use of grains of paradise, pepper and so on, in the early days
of spirit manufacture, for the object mentioned above, indirectly
gave rise to the statements which are still found in current
texts: "the addition of to the distillation of the pepper
(artemisia vulgaris, &c.,) not only induces the formation of the
crude spirit, but also strengthens the distillate, and may be
called the alembic of all other distillers."
There are two distinct types of gin, namely, the Dutch geneva
or holland and the British gin. Each of these types exists in
numerous varieties. Broadly speaking, British
gin is prepared with a highly rectified spirit, whereas in the
manufacture of Dutch gin a preliminary rectification is not
an integral part of the process. The old-fashioned Hollands is
prepared much after the following fashion. A mash consisting of
about one-third of malted barley or bier and two-thirds rye
meal is prepared, and infused at a somewhat high temperature.
After cooling, the whole is fermented with a small quantity of
yeast. After two to three days the attenuation is complete, and
the wash so obtained is distilled, and the resulting distillate
(aqua vitiis) is redistilled, with the addition of the flavouring
matter (juniper berries, &c.) and a little salt. Originally the
juniper berries were ground with the malt, but this practice no
longer obtains, but some distillers, it is believed, still mix the
juniper berries with the wort and subject the whole to fermenta-
tion. When the redistillation over juniper is repeated, the
product is termed double (geneva, &c.). There are numerous
variations in the process described, wheat being frequently
employed in lieu of rye. In the manufacture of British gin,1
a highly rectified spirit (see SPIRITS) is redistilled in the presence
of the flavouring matter (principally juniper and coriander),
and frequently this operation is repeated several times.
The product so obtained constitutes the "dry" gin of commerce.
Sweetened or cordialized gin is obtained by adding sugar and
1 The precise origin of the term "Old Tom," as applied to un-
sweetened gin, appears to be somewhat obscure. In the English
case of Board & son v. Huddart (1903), in which the plaintiffs estab-
lished their right to the "Caret Brand" trade-mark, it was proved
before Mr Justice Swinfin Eady that this firm had first adopted
about 1849 the punning association of the picture of a Tom cat
on a barrel with the name of "Old Tom"; and it was a natural
consequence that this was due to a tradition that a cat had fallen into
one of the vats, the gin from which was highly esteemed. But the
term "Old Tom" had been known before that, and Messrs Board &
Son inform us that previously "Old Tom" had been a name employed by
Lock & Co. of Thomas Channon & Co., of Shaldon's distillery; an old label
book in their possession (1909) shows a label and bill-head with a picture
of "Old Tom" the man on it, and another label shows a picture of
a sailor lad on shipboard described as "Young Tom."
flavouring matter (juniper, coriander, angelica, &c.) to the dry variety. Inferior qualities of gin are made by simply adding essential oils to plain spirit, the distillation process being omitted. The essential oil of juniper is a powerful diuretic, and gin is frequently prescribed in affections of the urinary organs.

**GINDELY, ANTON** (1829—1892), German historian, was the son of a German father and a Slavonic mother, and was born at Prague on the 3rd of September 1829. He studied at Prague and at Olmitz, and, after travelling extensively in search of historical material, became professor of history at the university of Prague and archivist for Bohemia in 1862. He died at Prague on the 24th of October 1892. Gindey’s chief work is his *Geschichte des dreissigjährigen Kriegs* (Prague, 1869—1880), which has been translated into English (New York, 1884), and his historical work is mainly concerned with the period of the Thirty Years’ War. Perhaps the most important of his numerous other works are: *Geschichte der böhmischen Brüder* (Prague, 1857—1858); *Rudolf II. und seine Zeit* (1862—1868), and a criticism of Wallenstein, *Waldstein während seines ersten Generalats* (1886). He wrote a history of Bethlen Gabor in Hungarian, and edited the *Monumenta historiae Bohemicae*. Gindey’s posthumous work, *Geschichte der Gegenformation in Böhmen*, was edited by T. Tuptzes (1894).

See the *Allgemeine deutsche Biographie*, Band 49 (Leipzig, 1903).

**GINGAL** or **GINGAL** (Hindustani *jungal*), a gun used by the armies throughout the East, usually a light piece mounted on a swivel; it sometimes takes the form of a heavy musket fired from a rest.

**GINGER** (Fr. *gingembre*, Ger. *Ingwer*), the rhizome or underground stem of *Zingiber officinale* (nat. ord. Zingiberaceae), a perennial reed-like plant growing from 3 to 4 ft. high. The flowers and leaves are borne on separate stems, those of the former being shorter than those of the latter, and averaging from 6 to 12 in. The flowers themselves are borne at the apex of the stems in dense ovato-oblong cone-like spikes from 2 to 3 in. long, composed of obtuse strongly-imbricated bracts with membranous margins, each bract enclosing a single small sessile flower. The leaves are alternate and arranged in two rows, bright green, smooth, tapering at both ends, with very short stalks and long sheaths which stand away from the stem and end in two small rounded auricles. The plant rarely flowers and the fruit is unknown. Though not found in a wild state, it is considered with very good reason to be a native of the warmer parts of Asia, over which it has been cultivated from an early period and the rhizomes transported into Europe. From Asia the plant has spread into the West Indies, South America, western tropical Africa, and Australia. It is commonly grown in botanic gardens in Britain.

The use of ginger as a spice has been known from very early times; it was supposed by the Greeks and Romans to be a product of southern Arabia, and was received by them by way of the Red Sea; in India it has also been known from a very remote period, the Greek and Latin names being derived from the Sanskrit. Flückiger and Hanbury, in their *Pharmacographia*, give the following notes on the history of ginger. On the authority of Vincent’s *Commercium et Navigatione of the Ancients*, it is stated that in the list of imports from the Red Sea into Alexandria, which in the second century of our era were there liable to the Roman fiscal duty, ginger occurs among other Indian spices. So frequent is the mention of ginger in similar lists during the middle ages, that it evidently constituted an important item in the commerce between Europe and the East. It thus appears in the tariffs of duties levied at Acre in Palestine about 1273., in the registers of Barcelona and Paris in 1296. Ginger seems to have been well known in England even before the Norman Conquest, being often referred to in the Anglo-Saxon leech-books of the 11th century. It was very common in the 13th and 14th centuries, ranking next in value to pepper, which was then the commonest of all spices, and costing on an average about 1s. 7d. per lb. Three kinds of ginger were known among the merchants of Italy about the middle of the 14th century: (1) *Belladi* or *Baladi*, an Arabic name, which, as applied to ginger, would signify country or wild, and denotes common ginger; (2) *Colombino*, which refers to Columbus, Kolam or Quilon, a port in Travancore, frequently mentioned in the middle ages, and (3) *Michino*, a name which denoted that the spice had been brought from or by way of Mecca. Marco Polo seems to have seen the ginger plant both in India and China between 1280 and 1290. John of Montecorvino, a missionary friar who visited India about 1292, gives a description of the plant, and refers to the fact of the root being dug up and transported. Nicolo di Conto, a Venetian merchant in the early part of the 15th century, also describes the plant and the collection of the root, as seen by him in India. Though the Venetians received ginger by way of Egypt, some of the superior kinds were taken from India overland by the Black Sea. The spice is said to have been introduced into America by Francisco de Mendoça, who took it from the East Indies to New Spain. It seems to have been shipped for commercial purposes from San Domingo as early as 1585. and from Barbados in 1654; so early as 1547 considerable quantities were sent from the West Indies to Spain.

Ginger is known in commerce in two distinct forms, termed respectively cooked and uncooked ginger, as having or wanting the epidermis. For the first, the pieces, which are called "races" or "hands," from their irregular palmate form, are washed and simply dried in the sun. In this form ginger presents a brown, more or less irregularly wrinkled or striated surface, and when broken shows a dark brownish fracture, hard, and sometimes horny and resinous. To produce uncooked ginger the rhizomes are washed, scraped and sun-dried, and are often subjected to a system of bleaching, either from the fumes of burning sulphur or by immersion for a short time in a solution of chlorinated lime. The whitewashed appearance that much of the ginger has, as seen in the shops, is due to the fact of its being washed in whiting and water, or even coated with sulphate of

by Francisco de Mendoça, who took it from the East Indies to New Spain. It seems to have been shipped for commercial purposes from San Domingo as early as 1585, and from Barbados in 1654; so early as 1547 considerable quantities were sent from the West Indies to Spain.
GINGHAM and GINKEL

Lime. This artificial coating is supposed by some to give the ginger a better appearance; it often, however, covers an inferior quality, and can readily be detected by the ease with which it rubs off, or by its leaving a white powdery substance at the bottom of the jar in which it is contained. Uncoated ginger, as seen in trade, varies from single joints an inch or less in length to flattish irregularly branched pieces of several joints, the "races" or "bands," and from 3 to 4 in. long; each branch has developed on its surface showing the former attachment of a leafy stem. The colour, when not whitewashed, is a pale buff; it is somewhat rough or fibrous, breaking with a short mealy fracture, and presenting on the surfaces of the broken parts numerous short bristly fibres.

The principal constituents of ginger are starch, volatile oil (to which the characteristic odour of the spice is due) and resin (to which is attributed its pungency). Its chief use is as a condiment or spice, but as an aromatic and stomachic medicine it is also used internally. "The stimulant, aromatic and carminative properties render it of much value in atonic dyspepsia, especially if accompanied with much flatulence, and as an adjunct to purgative medicines to correct griping." Externally applied as a rubefacient, it has been found to relieve headache and toothache. The rhizomes, cooked in a young green state, washed, scraped and preserved in syrup, form a delicious preserve, which is largely exported both from the West Indies and from China. Cut up into pieces like lozenges and preserved in sugar, ginger also forms a very agreeable sweetmeat.

GINGHAM, a cotton or linen cloth, for the name of which several origins are suggested. It is said to have been made at Guingamp, a town in Brittany; the New English Dictionary derives the word from Malay ging-gang, meaning "striped." The cloth is now of a light or medium weight, and woven of dyed or white yarn either in a single colour or different colours, and in stripes, checks or plaids. It is made in Lancashire and in Glasgow, and also to a large extent in the United States. Imitations of it are obtained by calico-printing. It is used for dresses &c.

GINGI, or GINGEE, a rock fortress of southern India, in the South Arcot district of Madras. It consists of three hills, connected by walls enclosing an area of 7 sq. m., and practically impregnable to assault. The origin of the fortress is shrouded in legend. When occupied by the Maharrats at the end of the 17th century, it withstood a siege of eight years against the armies of Aurangzeb. In 1750 it was captured by the French, who held it with a strong force for eleven years. It surrendered to the English, however, in 1760, after a 1000 day siege. It contained a number of English họcers, between whom the hostility between the two rival European powers in Coromandel, and left not a single ensign of the French nation avowed by the authority of its government in any part of India."}

GINGUENÉ, PIERRE LOUIS (1748–1815), French author, was born on the 27th of April 1748 at Rennes, in Brittany. He was educated at a Jesuit college in his native town, and came to Paris in 1772. He wrote criticisms for the Mercure de France, and composed a comic opera, Pomponia (1777). The Satire des saitres (1778) and the Confession de Zulmi (1779) followed. The Confession was claimed by six or seven different authors, and though the value of the piece is not very great, it obtained great success. His defence of Piccini against the partisans of Gluck made him still more widely known. He hailed the first symptoms of the Revolution, joined Giuseppe Cerutti, the author of the Mémoire pour le peuple français (1788), and others in producing the Feuille villageoise, a weekly paper addressed to the villages of France. He also celebrated in an indifferent ode the opening of the states-general. In his Lettres sur les confessions de J.-J. Rousseau (1791) he defended the life and principles of the author. He was imprisoned during the Terror, and only escaped with life by the downfall of Robespierre. Some time after his release he assisted, as director-general of the "commission exécutive de l'instruction publique," in reorganizing the system of public instruction, and he was an original member of the Institute of France. In 1797 the directory appointed him minister plenipotentiary to the king of Sardinia. After fulfilling his duties for seven months, very little to the satisfaction of his employers, Ginguène retired for a time to his country house of St. Prix, in the valley of Montmorency. He was appointed a member of the tribunate; but Napoleon, finding that he was not sufficiently tractable, had him expelled at the first "purge," and Ginguène returned to his literary pursuits. He was one of the commission charged to continue the Histoire littéraire de la France, and he contributed to the volumes of this series which appeared in 1814, 1817 and 1820. Ginguène's most important work is the Histoire de la littérature (1823, 1824, 1825, 1826). He was putting the finishing touches to the eighth and ninth volumes when he died on the 11th of November 1815. The last five volumes were written by Francesco Salvi and revised by Pierre Daunou.

In the composition of his history of Italian literature he was guided for the most part by the great work of Girolamo Tiraboschi, but he avoids the prejudices and party views of his model.

Ginguène edited the Décade philosophique, politique et littéraire till it was suppressed by Napoleon in 1807. He contributed largely to the Biographie universelle, the Mercure de France and the Encyclopédie méthodique; and he edited the works of Chamfort and of Lebrun. Among his minor productions are an opera, Pomponia or le tuteur mystifié (1777); La Satire des saitres (1778); De l'autorité de Rabelais dans la révolution présente (1791); De M. Necker (1798); Fables nouvelles (1810); Fables indécesses (1814). See "Encyclopédie" (1774) in the articles "M." and "J.-J." "Discours" by M. Daunou, prefixed to the 2nd ed. of the Hist. litt. d'Italie; D. J. Garat, Notice sur la vie et les ouvrages de P. L. Ginguène, prefixed to a catalogue of his library (Paris, 1817).

GINGKEL, GEORGE (1650–1703), Dutch general in the service of England, was born at Utrecht in 1650. He came of a noble family, and bore the title of Baron van Reece, being the eldest son of Godart Adrian van Reece, Baron Ginkel. In his youth he entered the Dutch army, and in 1688 he followed William, prince of Orange, in his expedition to England. In the following year he distinguished himself by a memorable exploit—the pursuit, defeat and capture of a Scottish regiment which had mutinied at Ipswich, and was marching northward across the Fens. It was the alarm excited by this mutiny that facilitated the passing of the first Mutiny Act in 1750. Ginkel accompanied William III. to Ireland, and commanded a body of Dutch cavalry at the battle of the Boyne. On the king's return to England General Ginkel was entrusted with the conduct of the war. He took the field in the spring of 1691, and established his headquarters at Mullingar. Among those who held a command under him was the marquis of Ruvigny, the recognized chief of the Huguenot refugees. Early in June Ginkel took the fortress of Ballymore, capturing the whole garrison, and also the English lords of the island in the Shannon, the castle of Limerick, the fort of Athlone, and the castle of Athlone, and reconquering the fortifications of Ballymore the army marched to Athlone, then one of the most important of the fortified towns of Ireland. The Irish defenders of the place were commanded by a distinguished French general, Saint-Ruth. The firing began on June 19th, and on the 30th the town was stormed, the Irish army retreating towards Galway, and taking up their position at Aughrim. Having strengthened the fortifications of Athlone and left a garrison there, Ginkel led the English, on July 13th, to Aughrim. An immediate attack was resolved on, and, after a severe and at one time doubtful contest, the crisis was precipitated by the fall of Saint-Ruth, and the disorganized Irish were defeated and fled. A horrible slaughter of the Irish followed the struggle, and 4000 corpses were left unburied on the field, besides a multitude of others that lay along the line of the retreat. Galway next capitulated, its garrison being permitted to retire to Limerick. There the viceroy Tyrconnel was in command of a large force, but his sudden death early in August left the command in the hands of General Sarsfield and the Frenchman D'Usson. The English came in sight of the town on the day of Tyrconnel's death, and the bombardment was immediately begun. Ginkel, by a bold device, crossed the Shannon and captured the camp of the Irish cavalry. A few days later he stormed the fort on Thomond Bridge, and after difficult negotiations a capitulation was signed, the terms of which were divided into a civil and a military treaty. Thus was completed the conquest or pacification of Ireland, and the services of the Dutch general were amply recognized and rewarded. He received the formal thanks of the House of Commons, and was
creating the king 1st earl of Athlone and baron of Aughtim. The immense forfeited estates of the earl of Limerick were given to him, but the grant was a few years later revoked by the English parliament. The earl continued to serve in the English army, and accompanied the king to the continent in 1693. He fought at the sieges of Namur and the battle of Neerwinden, and assisted in destroying the French magazine at Givet. In 1702, weaving his own claim to the position of commander-in-chief, he commanded the Dutch serving under the duke of Marlborough. He died at Utrecht on the 11th of February 1703, and was succeeded by his son the 2nd earl (1669-1710), a distinguished soldier in the reigns of William III and Anne. On the death of the 9th earl without issue in 1844, the title became extinct.

GINSBURG, CHRISTIAN DAVID (1831- ), Hebrew scholar, was born at Warsaw on the 25th of December 1831. Coming to England shortly after the completion of his education in the Rabbinic College at Warsaw, Dr Ginsburg continued his study of the Hebrew Scriptures, with special attention to the Megilloth. The first result of these studies was a translation of the Song of Songs, with a commentary historical and critical, published in 1857. A similar translation of Ecclesiastes, followed by treatises on the Karaites, on the Essenes and on the Kabbala, kept the author prominently before biblical students while he was preparing the first sections of his magnus opus, the critical study of the Massorah. Beginning in 1867 with the publication of Jacob ben Chajim's Introduction to the Rabbinic Bible, and the elaboration to it (1867), Dr Ginsburg had one of the most important tasks of the century on his hands, and in 1824-1853 published the second Rabbinic Bible, containing what has ever since been known as the Massorah; but neither were the materials available nor was criticism sufficiently advanced for a complete edition. Dr Ginsburg took up the subject almost where it was left by those early pioneers, and collected portions of the Massorah from the countless MSS scattered throughout Europe and the East. More recently Dr Ginsburg has published Fascimiles of Manuscripts of the Hebrew Bible (1897 and 1898), and The Text of the Hebrew Bible in Abbreviations (1901), in addition to a critical treatise on "the relationship of the so-called Codex Babylonicus of A.D. 918 to the Eastern Recension of the Hebrew Text" (1890, for private circulation). In the last-mentioned work he seeks to prove that the St Petersburg Codex, for so many years accepted as the genuine text of the Babylonian school, is in reality a Palestinian text carefully altered so as to render it conformable to the Babylonian recension. He subsequently undertook the preparation of a new edition of the Hebrew Bible for the British and Foreign Bible Society. He also contributed many articles to J. Kitto’s Encyclopaedia, W. Smith’s Dictionary of Christian Biography and the Encyclopedia Britannica.

GINSENG, the root of a species of Panax (P. Ginseng), native of Manchuria and Korea, belonging to the natural order Araliaceae, used in China as a medicine. Other roots are substituted for it, notably that of Panax quinquefolium, distinguished as American ginseng, and imported from the United States. At one time the ginseng obtained from Manchuria was considered to be the finest quality, and in consequence became so scarce that an increased demand produced its fall in price. The prepared in Korea is now the most esteemed variety. The root of the wild plant is preferred to that of cultivated ginseng, and the older the plant the better is the quality of the root considered to be. Great care is taken in the preparation of the drug. The account given by Koemper of the preparation of nindin, the root of Sium.linalg, in Korea, will give a good idea of the preparation of ginseng, nindin being a similar drug of supposed weaker virtue, obtained from a different plant, and often confounded with ginseng. "In the beginning of winter nearly all the population of Siansi turn out to collect the root, and make preparations for sleeping in the fields. The root, when collected, is macerated for three days in fresh water, or water in which rice has been boiled twice; it is then suspended in a closed vessel over the fire, and afterwards dried, until from the plate to which the moisture is condensed it presents a somewhat translucent appearance, which is considered a proof of its good quality." Ginseng of good quality generally occurs in hard, rather brittle, translucent pieces, about the size of the little finger, and varying in length from 2 to 4 in. The taste is mucilaginous, sweetish and slightly bitter and aromatic. The root is frequently forked, and it is probably owing to this circumstance that medicinal properties were in the first place attributed to it, its resemblance to the body of a man being supposed to indicate that it could restore virile power to the aged and impotent. In price it varies from 6 or 12 dollars to the enormous sum of 300 or 400 dollars an ounce.

Lockhart gives a graphic description of a visit to a ginseng merchant. Opening the outer box, the merchant removed several paper bags, and a cloth box, but these were found to be small boxes, or perhaps two small boxes, which, when taken out, showed the bottom of the large box and all the intervening space filled with more paper parcels. These parcels, he said, "contained quicklime, which spoils the appearance of the root by its moisture and moisture by its dryness, the live being packed in paper for the sake of cleanliness. The smaller box, which held the ginseng, was lined with sheet-lead; and a further covering of light paper was kept in little silken-covered boxes. Taking up a piece, he would not acclimatize the root to breath upon it, nor handle it; he would dilute upon the many merits of the drug and the curea it had effected. The cover of the root remaining to its qualities, was silk, either embroidered or plain, cotton cloth or paper." In China the ginseng is often sent to friends as a valuable present; in such cases, "accompanying the medicine is usually given a small, beautifully-finished double kettle, which the ginseng is prepared as follows. The inner kettle is made of silver, and between this and the outside vessel, which is a copper jacket, is a small space for holding water. The silver kettle, containing the medicine, is filled with rice, and the covers, made in cover in which rice is placed with a little water; the ginseng is put in the inner vessel with water, a cover is placed over the whole, and the apparatus is put on the fire. When the rice in the cover is sufficiently cooked, the medicine is ready, and is then eaten by the patient, who drinks the ginseng tea at the same time." The dose of the root is from 60 to 90 grains. During the use of the drug teadrinking is forbidden for at least a month, but no other change is made in the diet. It is taken in the morning, and usually from three to eight days together, and sometimes it is taken in the evening before going to bed.

The action of the drug appears to be entirely psychic, and comparable to that of the mandrake of the Hebrews. There is no evidence that it possesses any pharmacological or therapeutic properties.

GIOBERTI, VINCENZO (1801-1853), Italian philosopher, publicist and politician, was born in Turin on the 5th of April 1801. He was educated by the Jesuits, but under the influence of Mazzini, the freedom of Italy became his ruling motive in—his emancipation, not only from foreign masters, but from modes of thought alien to his genius, and detrimental to its European authority. This authority was in his mind connected with papal supremacy, though in a way quite novel—intellectual rule by the political authority, and this must be remembered of course in reading nearly all his writings, and also in estimating his position, both in relation to the ruling clerical party—the Jesuits—and also to the politics of the court of Piedmont after the accession of Charles Albert in 1831. He was now noticed by the king and made one of his chaplains. His popularity and private influence, however, were reasons enough for the court party to mark him
for exile; he was not one of them, and could not be depended on. Knowing this, he resigned his office in 1833, but was suddenly arrested on a charge of conspiracy, and, after an imprisonment of four months, was banished without a trial. Gioberti first went to Paris, and, a year later, to Brussels, where he remained till 1845, teaching philosophy, and assisting a friend in the work of a periodical. He spent his leisure time to work on a history of philosophical importance, with special reference to his country and its position. An amnesty having been declared by Charles Albert in 1846, Gioberti (who was again in Paris) was at liberty to return to Italy, but refused to do so till the end of 1847. On his entrance into Turin on the 29th of April 1848 he was received with the greatest enthusiasm. He refused the dignity of senator offered him by Charles Albert, preferring to represent his native town in the Chamber of Deputies, of which he was soon elected president. In the same year, a new ministry was formed, headed by Gioberti; but with the accession of Victor Emmanuel in March 1849, his active life came to an end. For a short time indeed he held a seat in the cabinet, though without a portfolio; but an irreconcilable disagreement soon followed, and his removal from Turin was accomplished by his appointment on a mission to Paris, whence he never returned. There, refusing the pension which had been offered him and all ecclesiastical preferment, he lived frugally, and spent his days and nights as at Brussels in literary labour. He died of apoplexy, on the 26th of October 1852.

Gioberti's writings are more important than his political career. In the general history of European philosophy they stand as milestones. As the speculations of Rosmini-Serbati, against which he wrote, have been called the last link added to medieval thought, so the system of Gioberti, known as 'Dominionism', more especially in its second and earlier works, is unrelated to other modern schools of thought. It shows a harmony with the Roman Catholic faith which caused Gioberti to declare that "Italian philosophy was still in the bonds of theology," and that Gioberti was no atheist in this life, is, with him a synthetic, subjective and psychological instrument. He constructs, as he declares, ontology, and begins with the "ideal form" (Ideale Forme, E.S., 1819) or "real being" (Essai, 1820); all other things are merely existences. God is the origin of all human knowledge (called Vida, thought), which is one and so to say identical with God himself. It is directly beheld (intuited) by reason, but in order to be of use it has to be reflected on, and this by means of language. A knowledge of being and existences (concrete, not abstract) and their mutual relations, is necessary as the beginning of philosophy. Gioberti is in some respects a Platonist. He identifies religion with civilization, and in his treatise Del primato morale e civile degli Italiani his arrival at the conclusion that the church is the axis on which the well-being of humanity turns, if he affirms the supremacy of the Christian religion in Italy, brought about by the restoration of the papacy as a moral dominion, founded on religion and public opinion. In his later works, the Italian policy of Pius IX by some of his statements was shifted his ground under the influence of events. His first work, written when he was thirty-seven, had a personal reason for its existence. A young fellow-exile and friend, Paolo Pallia, having many doubts and misgivings as to the reality of revelation and a future life, Gioberti at once set to work with La teoria del sorv-naturale, which was his first publication (1838). After this, philosophical treatises followed in rapid succession. The Teoria was followed by Introduzione allo studio della natura in three volumes (1839-1840). In this work he states his reasons for requiring a new method and new terminology. Here he brings out the doctrine that religion and philosophy are two distinct things, the one with true civilization in history. Civilization is a conditioned mediate tendency to perfection, to which religion is the final completion if carried out; it is the end of the second cycle expressed by the church and the sciences redemains existences. Gioberti (lished till 1846) on the lighter and more popular subjects, Del bello and Del buono, followed the Introduzione. Del primato morale e civile degli Italiani and the Prolegomeni to the same, and soon after his triumphant exhibition of the Jesuits, Il Gesù moderno, no doubt hastened the transfer of rule from clerical to civil hands. It was the popularity of these semi-political works, increased by other pamphlets, that gave the road to the pronounced anti-clerical sentiments that caused Gioberti to be welcomed with such enthusiasm on his return to his native country. All these works were perfectly orthodox and系统的izing the idealist trend of the era, though they had been written in the period of Gioberti's 'Dominionism', which has resulted since his time in the unification of Italy. The Jesuits, however, closed round the pope more firmly after his return to Rome, and in the end Gioberti's writings were placed on the Index of forbidden books (1862; also in 1870).

See monographs by G. D. Romagnosi (1829), F. Falco (1866); G. Pecchio, Storia dell' economia pubblica in Italia (1829), and article in Ersch and Gruber's Allgemeine Encyclopädie; for Gioberti's philosophy, L. Ferri, Essai sur l'histoire de la philosophie en XIX siècle (Paris, 1851); G. Werner, Die philoso-philosophie des XIX. Jahrhunderts, ii. (1888); appendix to Ueberweg's History of Philosophy (Eng. tr.) art. in Brownson's Quarterly Review (Boston, 1881); H. E. and the Italian Philosophy contemporanea in Italia (1866); R. Seydel's exhaustive article in Ersch and Gruber's Allgemeine Encyclopädie. The centenary of Gioberti called forth several monographs in Italy.
GIOLITTI—GIORGIONE

GIOFFI, GIOVANNI (1842— ), Italian statesman, was born at Mondovì on the 27th of October 1842. After a rapid career in the financial administration he was, in 1882, appointed councillor of state and elected to parliament. As deputy he chiefly acquired prominence by attacks on Magliani, treasury minister in the Depretis cabinet, and on the 9th of March 1889 was himself selected as treasury minister in the Depretis cabinet. On the fall of the Rudini cabinet in May 1893, Gioliti, with the help of a court clique, succeeded to the premiership. His term of office was marked by misfortune and misgovernment. The building crisis and the commercial rupture with France had impaired the situation of the state banks, of which one, the Banca Romana, had been further undermined by maladministration. A bank law, passed by Gioliti failed to effect an improvement. Moreover, he irritated public opinion by raising to senatorial rank the director-general of the Banca Romana, Signor Tanlongo, whose irregular practices had become a byword. The senate declined to admit Tanlongo, whom Gioliti, in consequence of an interpellation in parliament upon the condition of the Banca Romana, was obliged to arrest and prosecute. During the prosecution Gioliti abused his position as premier to abstract documents bearing on the case. Simultaneously a parliamentary commission of inquiry investigated the condition of the state banks. Its report, though acquitting Gioliti of personal dishonesty, proved disastrous to his political position, and obliged him to resign. His fall left the finances of the state disorganized; the pensions fund depleted, diplomatic relations with France strained in consequence of the massacre of Italian workmen at Aigue-Mortes, and Sicily and the Ligure in a state of revolt, which he had proved impotent to suppress. After his resignation he was impeached for abuse of power as minister, but the supreme court quashed the impeachment depending on the competence of the ordinary tribunals to judge ministerial acts. For several years he was compelled to play a passive part, having lost all credit. But by keeping in the background and giving public opinion time to forget his past, as well as by parliamentary intrigue, he gradually regained much of his former influence. He made capital of the Socialist agitation and of the repression to which other statesmen resorted, and gave the agitators to understand that were he premier they would be allowed a free hand. Thus he gained their favour, and on the fall of the Pelloux cabinet he became minister of the Interior in Zanardelli's administration, of which he was the real head. His policy of never interfering in strikes and leaving even violent demonstrations undisturbed at first proved successful, but indiscipline and disorder entering upon a pitch that Zanardelli had handled with caution, and upon which Gioliti, with his usual recklessness, had set his hand, Gioliti succeeded him as prime minister (November 1903). But during his tenure of office he, too, had to resort to strong measures in repressing some serious disorders in various parts of Italy, and thus he lost the favour of the Socialists. In March 1905, feeling himself no longer secure, he resigned, indicating Fortis as his successor. When Sonnino became premier in February 1906, Gioliti did not openly oppose him, but his followers did, and Sonnino was defeated in May, Gioliti becoming prime minister once more. GIORDANO, LUCA (1632—1705), Italian painter, was born in Naples, son of a very indifferently painter, Antonio, who imparted to him the first rudiments of drawing. Nature predestined him for the art, and at the age of eight he painted a cherub into one of his father's pictures, a feat which was at once noise abroad, and induced the vicerey of Naples to recommend the child to Ribera. His father afterwards took him to Rome, to study under Pietro da Cortona. He acquired the nickname of Luca Fa-presto (Luke Work-fast). One might suppose this nickname to be derived merely from the almost miraculous celebrity with which from an early age and throughout his life he handled the brush; but it is said to have had a more express origin. The father, we are told, poverty-stricken and greedy of gain, was perpetually urging his boy to exertion with the phrase, "Luca, få presto." The youth obeyed his parent to the letter, and would actually not so much as pause to snatch a hasty meal, but received into his mouth, while he still worked on, the food which his father's hand supplied. He copied nearly twenty times the "Battle of Constantine" by Julio Romano, and with proportionate frequency several of the great works of Raphael and Michelangelo. His rapidity, which belonged as much to invention as to mere handiwork, and his versatility, which enabled him to imitate other painters descriptively, earned for him two other epithets, "The Thunderbolt," (Falmine), and "The Proteus" of Painting. He shortly visited all the main seats of the Italian school of art, and formed for himself a style combining in a certain measure the ornamental pomp of Paul Veronese and the contrasting compositions and large schemes of chiaroscuro of Pietro da Cortona. He was noted also for lively and showy colour. Returning to Naples, and accepting every sort of commission by which money was to be made, he practised his art with so much applause that Charles II. of Spain towards 1687 invited him over to Madrid, where he remained thirteen years. Giordano was very popular at the Spanish court, being a sprightly talker along with his other marvellously facile gifts, and the king created him a cavalier. One anecdote of his rapidity of work is that the queen of Spain having one day made some inquiry about his wife, he at once showed Her Majesty what the lady was like by painting her portrait into the picture on which he was engaged. Soon after the death of Charles in 1700 Giordano, gorged with wealth, returned to Naples. He spent large sums in acts of munificence, and was particularly liberal to his poorer brethren of the art. He again visited various parts of Italy, and died in Naples on the 14th of January 1705, his last words being "O Napoli, sogliamio!" (O Naples, my heart's love!). One of his maxims was that the good painter is the one whom the public like, and that the public are attracted more by colour than by design.

Giordano had an astonishing readiness and facility, in spite of the general commonness and superficiality of his performances. He left many works in Rome, and far more in Naples. Of the latter one of the most renowned is "Christ expelling the Traders from the Temple," in the church of the Padri Girolamini, a colossal work, full of expressive lazzoroni; also the frescoes of S. Martino, and those in the Tesoro della Certosa, including the subject of "Moshe and the Brazen Serpent," and the cupola-paintings in the Church of S. Briga, which contains the artist's own tomb. In Spain he executed a surprising number of works,—continuing in the Escorial the series commenced by Cambiasi, and painting frescoes of the "Triumphs of the Church," the "Genealogy and Life of the Madonna," the stories of Moses, Gideon, David and Solomon, and the "Celebrated Women of Scripture," all works of large dimensions. His pupils, Aniello Magliani, Pietro Magliani, and Fausto Magliani, were assisted him in Spain. In Madrid he worked more in oil-colour, a Nativity there being one of his best productions. Other superior examples are the "Judgment of Paris" in the Berlin Museum, and "Christ with the Doctors in the Temple," in the Corsini Gallery of Rome. In Florence, in his closing days, he painted the Cappella Corsini, the Galleria Riccardi and other works. In youth he etched with considerable skill some of his own paintings, such as the "Slaughter of the Priests of Baal." He also painted much on the crystal borderings of looking-glasses, cabinets, &c., in many Italian palaces, and was, in this form of art, the master of Pietro Carofolo. His best pupil, in painting of the ordinary kind, was Paolo de Matteis. Bellori, in his Vite de' pittori moderni, is a leading authority regarding Luca Giordano. P. Benvenuto (1882) has written a work on the Riccardi paintings.

GIORGIONE (1477—1510), Italian painter, was born at Castelfranco in 1477. In contemporary documents he is always called (according to the Venetian manner of pronunciation and spelling) Zoro, Zoro or Zorzon of Castelfranco. A tradition, having its origin in the 17th century, represented him as the natural son of some member of the great local family of the Barbarelli, by a peasant girl of the neighbouring village of Vedelago; consequently he is commonly referred to in histories and
catalogues under the name of Giorgio Barbarelli or Barbarella. This tradition has, however, on close examination been proved baseless. On the other hand mention has been found in a contemporary document of an earlier Zorzon, a native of Velledago, living in Castelfranco in 1466. Vasari, who wrote before the Barbarella legend had sprung up, says that Giorgione was of very humble origin. It seems probable that he was simply the son or grandson of the afore-mentioned Zorzon the elder; that the after-claim of the Barbarelli to kindred with him was a mere piece of family vanity, very likely suggested by the analogous case of Leonardo da Vinci; and that, this impetus put abroad, the peasant-mother of Velledago was invented on the ground of some dim knowledge that his real progenitors came from that village.

Of the facts of his life we are almost as meagrely informed as of the circumstances of his birth. The little city, or large fortified village, for it is scarcely more, of Castelfranco in the Trevisan stands in the midst of a rich and broken plain at some distance from the last spurs of the Venetian Alps. From the natural surroundings of Giorgione's childhood was no doubt derived his ideal of pastoral scenery, the country of pleasant copses, glades, brooks and hills amid which his personages love to wander or recline with lute and pipe. How early in boyhood he went to Venice we do not know, but internal evidence supports the statement of Ridolfi that he served his apprenticeship there under Giovanni Bellini; and there he made his fame and had his home. That his gifts were early recognized we know from the facts, recorded in contemporary documents, that in 1500, when he was only twenty-three (that is if Vasari gives rightly the age at which he died), he was chosen to paint portraits of the Doge Agostino Barbarigo and the condottiere Consalvo Ferrante; that in 1504 he was commissioned to paint an altarpiece in memory of Matteo Costanzo in the cathedral of his native town, Castelfranco; that in 1507 he received at the order of the Council of Ten part payment for a picture (subject not mentioned) on which he was engaged for the Hall of the Audience in the ducal palace; and that in 1507-1508 he was employed, with other artists of his own generation, to decorate with frescoes the exterior of the newly rebuilt Fondaco dei Tedeschi or German merchants' hall at Venice, having already done similar work on the exterior of the Casa Soranzo, the Casa Grimani alli Servi and other Venetian palaces. Vasari gives also an important event in Giorgione's life, and one which had influence on his work, his meeting with Leonardo da Vinci on the occasion of the Tuscan master's visit to Venice in 1500. In September or October 1510 he died of the plague then raging in the city, and within a few days of his death we find the great art-patroness and amateur, Isabella d'Este, writing from Mantua and trying in vain to secure for her collection a night-piece by his hand of the fame which had reached her.

All accounts agree in representing Giorgione as a personage of distinguished and romantic charm, a great lover, a great musician, made to enjoy in life and to express in art to the uttermost the delight, the splendour, the sensuous and imaginative grace and fulness, not untinged with poetical melancholy, of the Venetian existence of his time. They represent him further as having made in Venetian painting an advance analogous to that made in Tuscan painting by Leonardo more than two years before; that is as having released the art from the last shackles of archaic rigidity and placed it in possession of full freedom and the full mastery of its means. He also introduced a new range of subjects. Besides altarpieces and portraits he painted pictures that told no story, whether biblical or classical, or if they professed to tell such, neglected the action and simply embodied in form and colour moods of lyrical or romantic feeling, much as a musician might embody them in sounds. Immortal were the tenderness and felicity of genius, he had for a time an overwhelming influence on his contemporaries and immediate successors in the Venetian school, including Titian, Sebastian del Piombo, the elder Palma, Cariani and the two Campagnolas, and not a little even on seniors of long-standing fame such as Giovanni Bellini. His name and work have exercised, and continue to exercise, no less a spell on posterity. But to identify and define, among the relics of his age and school, precisely what that work is, and to distinguish it from the kindred work of other men whom his influence inspired, is a very difficult matter. There are inclusive critics who still claim for Giorgione nearly every painting of the time that at all resembles his manner, and there are exclusive critics who pare down to some ten or a dozen the list of extant pictures which they will admit to be actually his.

To name first those which are either certain or command general acceptance, placing them in something like an approximate and probable order of date. In the Uffizi at Florence are two companion pieces of the "Trial of Moses" and the "Judgment of Solomon," the latter the finer and better preserved of the two, which pass, no doubt justly, as typical works of Giorgione's youth, and exhibit, though not yet ripely, his special qualities of colour-richness and landscape romance, the peculiar facial types of his predilection, with the pure form of forehead, fine oval of cheek, and somewhat close-set eyes and eyebrows, and the intensity of that still and brooding sentiment with which, rather than with dramatic life and movement, he instinctively invests his figures. Probably the earliest of the portraits by common consent called his is the beautiful one of a young man at Berlin. His earliest devotional picture would seem to be the highly finished "Christ bearing his Cross" (the head and shoulders only, with a peculiarly serene and high-bred cast of features) formerly at Vicenza and now in the collection of Mrs Gardner at Boston. Other versions of this picture exist, and it has been claimed that one in private possession at Vienna is the true original: erroneously in the judgment of the present writer. Another "Christ bearing the Cross," with a Jew dragging at the rope round his neck, in the church of San Rocco at Venice, is a ruined but genuine work, quoted by Vasari and Ridolfi, and copied with the name of Giorgione appended, by Van Dyck in that master's Chatsworth sketch-book. (Vasari gives it to Giorgione in his first and to Titian in his second edition.) The composition of a lost early picture of the birth of Paris is preserved in an engraving of the "Teniers Gallery" series, and an old copy of part of the same picture is at Budapest. In the Giovannielli Palace at Venice is that fascinating and enigmatical mythology or allegory, known to the Anonimo Morelliano, who saw it in 1550 in the house of Gabriel Vendramin, simply as "the small landscape with the storm, the gipsy woman and the soldier"; the picture is conjecturally interpreted by modern authorities as illustrating a passage in Statius which describes the meeting of Aedrastus with Hypsipyle when she was serving as nurse with the King of Nemea. Still belonging to the earlier part of the painter's brief career is a beautiful and pessimically judicious at St Peter's, a picture of great simplicity on either side of the foot of the throne, a high parapet behind them, and a beautiful landscape of the master's usual type seen above it. Nearly akin to this masterpiece, not in shape or composition but by the type of the Virgin and the very Bellinesque St Francis, is the altarpiece of the Madonna with St Francis and St Roch at Madrid. Of the master's fully ripened time is the fine and again enigmatical picture formerly in the house of Tadddeo Contarini at Venice, described by contemporary witnesses as the "Three Philosophers," and now, on slender enough grounds, supposed to represent Evander showing Aeneas the site of Troy as narrated in the eighth Aeneid. The portrait of a knight of Malta in the Uffizi at Florence has more power and authority, if less sentiment, than the earlier example at Berlin, and may be taken to be the
GIOTTINO

master's middle time. Most entirely central and typical of all Giorgione's extant works is the Sleeping Venus at Dresden, first recognized by Morelli, and now universally accepted, as being the same as the picture seen by the Anonimo and later by Ridolfi in the Casa Marcello at Venice. An exquisitely pure and severe rhythm of line and contour chastens the sensuous richness of the presentment: the sweep of white drapery on which the goddess lies, and of glowing landscape that fills the space behind her, most harmoniously frame her divinity. It is recorded that the master left this piece unfinished and that the landscape, with a Cupid which subsequent restoration has removed, were completed after his death by Titian. The picture of Antonio Gricciad at Bordeaux is the poet's own Venus at the Uffizi and of many more by other painters of the school; but none of them attained the quality of the first exemplar. Of such small scenes of mixed classical mythology and landscape as early writers attribute in considerable number to Giorgione, there have survived at least two which bear strong evidences of his handiwork, though the action is in both of unwonted liveliness, namely the Apollo and Daphne of the Seminario at Venice and the Orpheus and Eurydice of Bergamo. The portrait of Antonio Gricciad at Bordeaux represents his fullest and most penetrating power in that branch of art. In his last years the purity and relative slenderness of form which mark his earlier female nudes, including the Dresden Venus, gave way to ideals of ampler mould, more nearly approaching those of Titian and his successors in Venetian art; as is proved by those last remaining fragments of the frescoes on the Grand Canal front of the Fondaco del Tedeschi which were seen and engraved by Zanetti in 1766, but have now totally disappeared. Such change of ideal is apparent enough in the famous "Concert" or "Pastoral Symphony" of the Louvre, probably the latest, and certainly one of the most characteristic and harmoniously splendid, of Giorgione's creations that has come down to us, and has caused some critics hastily to doubt its authenticity.

We pass now to pictures for which some affirms and others deny the right to bear Giorgione's name. As youthful in style as the two early pictures in the Uffizi, and closely allied to them in feeling, though less so in colour, is an unexplained subject in the National Gallery, sometimes called for want of a better title the "Golden Age"; this is officially and by many critics given only to the "school of" Giorgione, but may not unreasonably be claimed for his own work (No. 1173). There is also in England a group of three paintings which are certainly by one hand, and that a hand very closely related to Giorgione if not actually his own, namely the small oblong "Adoration of the Magi" in the National Gallery (No. 1160), the "Adoration of the Shepherds" belonging to Lord Allenendale (with its somewhat inferior but still attractive replica at Vienna), and the small "Holy Family" in the collection of Mr. H. Benson. The type of the Madonna in all these three pieces is different from that customary with the master, but there seems no reason why he should not at some particular moment have changed his model. The sentiment and figures of the scenes, the cast of draperies, the technical handling, and especially, in Lord Allenendale's picture, the romantic richness of the landscape, all incline us to accept the group as original, notwithstanding the deviation of type already mentioned and certain weaknesses of drawing and proportion which we should hardly looked for. Better known to European students in general are the two fine pictures commonly given to the master at the Pitti gallery in Florence, namely the "Three Ages" and the "Concert." Both are very Giorgionesque, the "Three Ages" leaning rather towards the early manner of Lorenzo Lotto, to whom by some critics it is actually given. The "Concert" is held on technical grounds by some of the best judges rather to bear the character of Titian at the moment when the inspiration of Giorgione was strongest on him, at least so far as concerns the extremely beautiful and courageous handling of that beautiful picture playing on the clavicord with reverted head, a very incarnadine, sustaining, and appealing note and yearning—the other figures are too much injured to judge.

There are at least two famous single portraits to which critics will probably never agree whether they are among the later works of Giorgione or among the earliest of Titian under his influence: these are the jovial and splendid half-length of Catherine Cornaro (or a stout lady much resembling her) with a bas-relief, in the collection of Signor Crespi at Milan, and the so-called "Ariosto" from Lord Ardenly's collection acquired for the National Gallery in 1904. Ancient and half-effaced inscriptions, of which there is no cause to doubt the genuineness, ascribe them both to Titian; both, to the mind of the present writer at least, are more nearly akin to such undoubted early Titians as the "Man with the Book" at Hampton Court and the "Man with the Glove" at the Louvre than to any authenticated work of Giorgione. At the same time it should be remembered that Giorgione is known to have actually enjoyed the patronage of Catherine Cornaro and to have painted her portrait. The Giorgionesque influence and feeling, to a degree almost of sentimental exaggeration, encounter us again in another beautiful Venetian portrait at the National Gallery which has sometimes been claimed for him, that of a man in crimson velvet with white pleated shirt and a background of bays, long attributed to a man called "Francesco da Zanetti." The full-face portrait of a woman in the Borghese gallery at Rome has the marks of the master's design and inspiration, but in its present sadly damaged condition can hardly be claimed for his handiwork. The head of a boy with a pipe at Hampton Court, a little over life size, has been enthusiastically claimed as Giorgione's workmanship, but is surely too slack and soft in handling to be anything more than an early copy of a lost work, analogous to, though better than, the similar copy at Vienna of a young man with an arrow, a subject he is known to have painted. The early records prove indeed that not a few such copies of Giorgione's most admired works were produced in his own time or shortly afterwards. One of the most interesting and unmistakable such copies still extant is the picture formerly in the Manfrin collection at Venice, afterwards in that of Mr. Barker in London, and now at Dresden, which is commonly called "The Horoscope," and represents a woman seated near a classic ruin with a young child at her feet, an armed youth standing looking down at them, and a turbanned sage seated near with compasses, disk and book. Of important subject pictures belonging to the debatable borderland between Giorgione and his imitators are the large and interesting unfinished "Judgment of Solomon" at Kingston Lacy, which must certainly be the same that Ridolfi saw and attributed to him in the Casa Grimani at Venice, but has weaknesses of design and drawing sufficiently baffling to criticism; and the "Woman taken in Adultery" in the public gallery at Glasgow, a picture truly Giorgionesque in richness of colour, but betraying in its awkward composition, the relative coarseness of its types and the insincere, mechanical animation of its movements, the hand of some lesser master of the school, almost certainly (by comparison with his existing engravings and woodcuts) that of Domenico Campagnola. It seems unnecessary to refer, in the present notice, to any of the numerous other and inferior works which have been claimed for Giorgione by a criticism unable to distinguish between a living voice and its echoes.

This biography—Morelli, Notizie, &c. (ed. Frizzi, 1884); Vasari (ed. Milanesi), vol. iv.; Ridolfi, Le Maraviglie dell' arte, vol. i.; Zanetti, Varie Pitture (1766); Crowe-Cavalcaselle, History of Painting in North Italy; Morelli, Kunstkritische Studien; Gronau, Zorzi da to the elder, sua origine (1858); Hegel-Codka, are present in "Great Masters" series, 1900; Ugo Monneret de Villard, Giorgione da Castelfranco (1905). The two last-named works are critically far too inclusive, but useful as going over the whole ground of discussion of all references to earlier authorities, &c.

GIOTTINO (1342–1357), an early Florentine painter. Vasari is the principal authority in regard to this artist; he claims that the older forerunners of the early masters were brought into harmony with such facts as can now be verified. It would appear that there was a painter of the name of Tommaso (or Maso) di Stefano,
GIOTTO

termed Giottino; and the Giottino of Vasari is said to have been born in 1324, and to have died early, of consumption, in 1357, dates which must be regarded as open to considerable doubt. Stefano, the father of Tommaso, was himself a celebrated painter in the early revival of art; his naturalism was indeed so highly appreciated by contemporaries as to earn him the appellation of "Scienza della Natura" (ape of nature). He, it seems, instructed his son, who, however, applied himself with greater predilection to studying the works of the great Giotto, formed his style on these, and hence was called Giottino. It is even said that Giottino was really the son (others say the great-grandson) of Giotto. To this statement little or no importance can be attached. To Marsilius Ficino, and to Vasari, who attributed the frescoes in the church of S. Silvestro in the lower church of Assisi, to Giotto di Stefano, who worked in the second half of the 14th century—very excellent productions of their period. They are much damaged, and the style is hardly similar to that of the Sylvester frescoes. It might hence be inferred that two different men produced the works which are unitedly fathered upon the half-legendary "Giotto," the consumptive youth, solitary and melancholic, but passionately devoted to his art. A large number of other works have been attributed to the same hand; we need only mention an "Apparition of the Virgin to St Bernard," in the Florentine Academy; a lost painting, very popular in its day, commemorating the expulsion, which took place in 1343, of the duke of Athens from Florence; and a marble statue erected on the Florentine campanile. Vasari particularly praises Giottino for well-blended chiaroscuro.

GIOTTO [GIOTTO DI BONDONE] (1267?–1337), Italian painter, was born at Vespignano in the Mugello, a few miles north of Florence, according to one account in 1267, and according to another, which from the few known circumstances of his life seems more likely to be correct, in 1266 or 1267. His father was a landowner at Colle in the commune of Vespignano, described in a contemporary document as vir praedator, but by biographers both early and late as a poor peasant; probably therefore a peasant proprietor of no large possessions but of reputable stock and descent. It is impossible to tell whether there is any truth in the legend of Giotto's boyhood which relates how he first showed his disposition for art, and attracted the attention of Cimabue, by being found drawing one of his father's sheep with a sharp stone on the face of a smooth stone or slate. With his father's consent, the story goes on, Cimabue carried off the boy to be his apprentice, and it was under Cimabue's tuition that Giotto took his first steps in the art of which he was afterward to be the great emancipator and renovator. The place where these early steps can still, according to tradition, be traced, is in the first and second, reckoning downwards, of the three courses of frescoes which adorn the walls of the nave in the Upper Church of St Francis at Assisi. These frescoes represent subjects of the Old and New Testament, and great labour, too probably futile, has been spent in trying to pick out those in which the youthful handiwork of Giotto can be discerned, as it is imagined, among that of Cimabue and his other pupils. But the truth is that the figure of Cimabue himself, in spite of Dante's testimony to the contrary, is of the very first order of mediocrity, of which Giottino, the youngest son of Cimabue, had, under the search-light of modern criticism melted into almost mythical vagueness. His accepted position as Giotto's instructor and the pioneer of reform in his art has been attacked by modern critics, who consider that Giotto, the father of Tommaso, was himself a celebrated painter in the early revival of art; his naturalism was indeed so highly appreciated by contemporaries as to earn him the appellation of "Scienza della Natura" (ape of nature). He, it seems, instructed his son, who, however, applied himself with greater predilection to studying the works of the great Giotto, formed his style on these, and hence was called Giottino. It is even said that Giottino was really the son (others say the great-grandson) of Giotto. To this statement little or no importance can be attached. To Marsilius Ficino, and to Vasari, who attributed the frescoes in the church of S. Silvestro in the lower church of Assisi, to Giotto di Stefano, who worked in the second half of the 14th century—very excellent productions of their period. They are much damaged, and the style is hardly similar to that of the Sylvester frescoes. It might hence be inferred that two different men produced the works which are unitedly fathered upon the half-legendary "Giotto," the consumptive youth, solitary and melancholic, but passionately devoted to his art. A large number of other works have been attributed to the same hand; we need only mention an "Apparition of the Virgin to St Bernard," in the Florentine Academy; a lost painting, very popular in its day, commemorating the expulsion, which took place in 1343, of the duke of Athens from Florence; and a marble statue erected on the Florentine campanile. Vasari particularly praises Giottino for well-blended chiaroscuro.
in colour and design; the compositions, especially the first three, fitted with admirable art into the cramped spaces of the vaulting, the subjects, no doubt in the main dictated to the artist by his Franciscan employers, treated in no cold or mechanical spirit but with a full measure of vital humanity and original feeling. Had the career and influence of St Francis had not been cut short before the completion of the frescoes the same spirit, that of inspiring these noble works of art, they would still have been entitled to no small gratitude from mankind. Other works at Assisi which most modern critics, but not all, attribute to Giotto himself are three miracles of St Francis and portions of a group of frescoes illustrating the history of Mary Magdalene, both in the Lower Church; and again, in one of the transepts of the same Lower Church, a series of ten frescoes of the Life of the Virgin and Christ, concluding with the Crucifixion. It is to be remarked as to this transept series that several of the frescoes present not only the same subjects, but with a certain degree of variation the same compositions, as are found in the master's great series executed in the Arena chapel at Padua in the fullness of his powers about 1306; and that the versions in the Assisi transept show a relatively greater degree of technical accomplishment than the Paduan versions, with a more attractive charm and more abundance of accessory ornament, but a proportionately less degree of that simple grandeur in composition and direct strength of human motive which are the special notes of Giotto's style. Therefore a minority of critics refuse to accept the modern attribution of this transept series to Giotto himself, and see in it later work by an accomplished pupil softening and refining upon his master's original creations at Padua. Others, insisting that these unquestionably beautiful works must be by the hand of Giotto and none but Giotto, maintain that in comparison with the Paduan examples they illustrate a gradual progress, which can be traced in other of his extant works, from the relatively ornate and soft to the austerely grand and simple.

This argument is enforced by comparison with early work of the master's at Rome as to the date of which we have positive evidence. In 1298 Giotto completed for Cardinal Stefaneschi for the price of 2200 gold ducats a mosaic of Christ saving St Peter from the waves (the celebrated "Navicella"); this is still to be seen, but in a completely restored and transformed state, in the vestibule of St Peter's. For the same patron he executed, probably just before the "Navicella," an elaborate ciborium or altar-piece for the high altar of St Peter's, for which he received 800 ducats. It represents on the principal face a colossal Christ enthroned with adoring angels beside him and a kneeling donor at his feet, and the martyrology of St Peter and St Paul on separate panels to right and left; on the reverse is St Peter attended by St George and other saints, receiving from the donor a model of his gift, with stately full-length figures of two apostles to right and two to left, besides various accessory scenes and figures in the predellas and the margins. The separated parts of this altar-piece are still to be seen, in a quite genuine though somewhat tarnished condition, in the sacristy of St Peter's. A third work by the master at Rome is a repaired fragment at the Lateran of a fresco of Pope Boniface VIII. proclaiming the jubilee of 1300. The "Navicella" and the Lateran fragment are too much ruined to argue from; but the ciborium panels, it is contended, combine with the aspects of majesty and strength a quality of ornate charm and suavity such as is remarked in the transept frescoes of Assisi. The sequence proposed for these several works is accordingly, first the St Peter's ciborium, next the allegories in the vaulting of the Lower Church, next the three frescoes of St Francis' miracles in the portal transept, next the panels in the Upper Church; and last, perhaps after an interval and with the help of pupils, the scenes from the life of Mary Magdalene in her chapel in the Lower Church. This involves a complete reversal of the prevailing view, which regards the unequal and sometimes clumsy compositions of this St Francis series as the earliest independent work of the master. It must be admitted that there is something paradoxical in the idea of a progress from the manner of the Lower Church transept series of the life of Christ to the much ruder manner of the Upper Church series of St Francis. A kindred obscurity and little less conflict of opinion await the inquirer at almost all stages of Giotto's career. In 1341 there were partially recovered from the wattle the three frescoes executed in the chapel of the Magdalene, in the Bargello or Palace of the Podesta at Florence, to celebrate (as was supposed) a pacification between the Black and White parties in the state effected by the Cardinal d'Acquasparta as delegate of the pope in 1302. In them are depicted a series of Bible scenes, besides great compositions of Hell and Paradise, and in the Paradise are introduced portraits of Dante, Brunetto Latini and Corso Donato. These recovered fragments, freely restored as soon as they were disclosed, were acclaimed as the work of Giotto and long held in especial regard for the sake of the portrait of Dante. Latterly it has been shown that if Giotto ever executed them at all, which is doubtful, it must have been at a later date than the supposed pacification, and that they must have suffered grievous injury in the fire which destroyed a great part of the building in 1332, and been afterwards repainted by some well-trained follower of the school. To about 1302 or 1303 would belong, if there is truth in it, the familiar story of Giotto's O. Pope Benedict XI., the successor of Boniface VIII., sent, as the tale runs, a messenger to bring him proofs of the painter's powers. Giotto would give the pope a sample of his talent than an O drawn with a free sweep of the brush from the elbow; but the pope was satisfied and engaged him at a great salary to go and adorn with frescoes the papal residence at Avignon. Benedict, however, dying at this time (1309), nothing came of this commission; and the remains of Italian 14th-century frescoes still to be seen at Avignon are now recognized as the work, not, as was long supposed, of Giotto, but of the Sienese Simone Martini and his school. At this point in Giotto's life we come to the greatest by far of his undestroyed and undisputed enterprises, and one which can with some certainty be dated. This is the series of frescoes with which he decorated the entire internal walls of the chapel built at Padua in honour of the Virgin of the Annunciation by a rich citizen of the town, Enrico Scrovegni, perhaps in order to atone for the sins of his father, a notorious usurer whom Dante places in the seventh circle of hell. The building is on the site of an ancient amphitheatre, and is therefore generally called the chapel of the Arena. Since it is recorded that Dante was Giotto's guest at Padua, and since we know that it was in 1306 from Bologna to that city, we may conclude that to the same year, 1306, belongs the beginning of Giotto's great undertaking in the Arena chapel. The scheme includes a Saviour in Glory over the altar, a Last Judgment, full of various and impressive incident, occupying the whole of the entrance wall, with a series of subjects from the Old and New Testament and the apocryphal Life of Christ painted in three tiers on either side wall, and lowest of all a fourth tier with emblematic Virtues and Vices in monochrome; the Virtues being on the side of the chapel next the incidents of redemption in the entrance fresco of the Last Judgment, the Vices on the side next the incidents of perdition. A not improbable tradition asserts that Giotto was helped by Dante in the choice and disposition of the subjects. The frescoes, though not free from injury and retouching, are upon the whole in good condition, and nowhere else can the highest powers of the Italian mind and hand at the beginning of the 14th century be so well studied as here. At the close of the middle ages we find Giotto laying the foundation upon which all the progress of the Renaissance was afterwards securely based. In his day the knowledge possessed by painters of the human frame and its structure rested only upon general observation and not upon detailed or scientific study; while to facts other than those of humanity their observation had never been closely directed. Of linear perspective they possessed but elementary and empirical ideas, and their endeavours to express aerial perspective and deal with the problems of light and shade were rare and partial. As far as painting could possibly be carried under these conditions, it was carried by Giotto. In its choice of
subjects, his art is entirely subservient to the religious spirit of his age. Even in its mode of conceiving and arranging those subjects it is in part still tramelled by the rules and consecrated traditions of the past. Many of those truths of nature to which the painters of succeeding generations learned to give accurate and expressive representation were almost effaced. He was naturally alive to the truth of imperfect symbol and suggestion. But among the elements of art over which he has control he maintains so just a balance that his work produces in the spectator less sense of imperfection than that of many later and more accomplished masters. In some particulars his mature painting, as we see it in the Arena chapel, has never been surpassed—in mastery of concise and expressive generalized line and of inventive and harmonious decorative tint; in the judicious division of the field and massing and scattering of groups; in the combination of high gravity with complete frankness in conception, and the union of noble dignity in the types with direct and vital truth in the gestures of the personages.

The frescoes of the Arena chapel must have been a labour of years, and of the date of their termination we have no proof. Of many other works said to have been executed by Giotto at Padua, all that remains consists of some scarce recognizable traces in the chapter-house of the great Franciscan church of St. Antonio. For twenty years or more we lose all authentic data as to Giotto’s doings and movements. Vasari, indeed, sends him on a giddy but in the main evidently fabulous round of travels, including a sojourn in France, which it is certain he never made. Besides Padua, he is said to have resided and left great works at Ferrara, Ravenna, Urbino, Rimini, Faenza, Lucca and other cities; in some of them paintings of his school are still shown, but nothing which can fairly be claimed to be by his hand. It is recorded also that he was much employed in his native city of Florence; but the vandalism of later generations has effaced nearly all that he did there. Among works whitewashed over by posterity were the frescoes with which he covered no less than five chapels in the church of Santa Croce. Two of these, the chapels of the Bardi and the Peruzzi families, were scraped in the early part of the 19th century, and very important remains were uncovered and immediately subjected to a process of restoration which has robbed them of half their authenticity. But through the ruins of time we can trace in some of these Santa Croce frescoes all the qualities of Giotto’s work at an even higher and more mature development than in the best examples at Assisi or Padua. The frescoes of the Bardi chapel tell again the story of St Francis, to which so much of his best power had already been devoted; those of the Peruzzi chapel deal with the lives of St John the Baptist and St John the Evangelist. Such scenes as the Funeral of St Francis, the Dance of Herodias’s Daughter, and the Resurrection of St John the Evangelist, which have to some extent escaped the disfigurations of the restorer, are among acknowledged classics of the world’s art. The only clues to the dates of any of these works are to be found in the facts that among the figures in the Bardi chapel occurs that of St Louis of Toulouse, who was not canonized till 1317, therefore the painting must be subsequent to that year, and that the “Dance of Salome” must have been painted before 1331, when it was copied by the Lorenzetti at Siena. The only other extant works of Giotto at Florence are a fine “Crucifix,” not undisputed, at San Marco, and the majestic but somewhat heavy altar-piece of the Madonna, probably an early work, which is placed in the Academy beside a more primitive Madonna supposed to be the work of Cimabue.

Towards the end of Giotto’s life we escape again from confused legend, and from the tantalizing record of works which have not survived for us to verify, into the region of authentic document and fact. It appears that Giotto had come under the notice of Duke Charles of Calabria, son of King Robert of Naples, during the visits of the duke to Florence which took place between 1326 and 1328, in which year he died. Soon afterwards Giotto must have gone to King Robert’s court at Naples, where he was enrolled as an honoured guest and member of the household by a royal decree dated the 20th of January 1330. Another document shows him to have been still at Naples two years later.

Tradition says much about the friendship of the king for the painter and the freedom of speech and jest allowed him; much also of the works he carried out at Naples in the Castel Nuovo, the Castel dell’Ovo, and the church and convent of Sta Chiara. Not a trace of these works remains; and others which later artists ascribed to Giotto on the strength of a late and virtually alluring decree of the convent of Sta Chiara have been proved not to be his.

Meantime Giotto had been advancing, not only in years and worldly fame, but in prosperity. He was married young, and had, so far as is recorded, three sons, Francesco, Niccola and Donato, and three daughters, Bice, Caterina and Lucia. He had added by successive purchases to the plot of land inherited from his father at Vespignano. His fellow-citizens of all occupations and degrees delighted to honour him. And now, in his sixty-eighth year (if we accept the birth-date 1266/7), on his return from Naples by way of Gaeta, he received the final and official testimony to the esteem in which he was held at Florence. By a solemn decree of the Priori on the 12th of April 1334, he was appointed master of the works of the cathedral of Sta Reparata (later and better known as Sta Maria del Fiore) and official architect of the city walls and the towns within her territory. What training as a practical architect his earlier career had afforded him we do not know, but his interest in the art from the beginning is made clear by the carefully studied architectural backgrounds of many of his frescoes. Dying on the 8th of January 1336 (old style 1337), Giotto only enjoyed his new dignities for two years. But in the course of them he had found time not only to make an excursion to Milan, on the invitation of Azzo Visconti and with the sanction of his own government, but to plan two great architectural works at Florence and superintend the beginning of their execution, namely the west front of the cathedral and its detached campanile or bell-tower. The unfinished enrichments of the cathedral front were stripped away in a later age. The foundation-stone of the Campanile was laid with solemn ceremony in the presence of a great concourse of magistrates and people on the 28th of July 1334. Its lower courses seem to have been completed from Giotto’s design, and the first course of its sculptured ornaments (the famous series of primitive Arts and Industries) actually by his own hand, before his death. It is not clear what modifications of his design were made by Andrea Pisano, who was appointed to succeed him, or again by Francesco Talenti, to whom the work was next entrusted; but the incomparable structure as we now see it stands just as Giotto left it to the world’s esteem as the most fitting monument to the genius who first conceived and directed it.

The art of painting, as re-created by Giotto, was carried on throughout Italy by his pupils and successors with little change or development for nearly a hundred years; until a new impulse was given to art by the combined influences of naturalism and classicism in the hands of men like Donatello and Masaccio. Most of the anecdotes related of the master are probably inaccurate in detail, but the general character both as artist and man which tradition has agreed in giving him can never be assailed. He was from the first a kind of popular hero. He is celebrated by the poet Petrarch and by the historian Villani. He is made the subject of tales and anecdotes by Boccaccio and by Franco Sacchetti. From these notices, as well as from Vasari, we gain a distinct picture of the man, as one whose nature was in keeping with his country origin; whose sturdy frame and plain features corresponded to a character rather distinguished for shrewd and genial strength than for subliminous or more ascetic qualities; a master craftsman, to whose strong combining and inventing powers nothing came amiss; conscious of his own deserts, never at a loss either in the things of art or in the things of life, and equally ready and efficient whether he has to design the scheme of some great spiritual allegory in colour or imperishable monument in stone, or whether he has to show his wit in the encounter of practical jest and repartee. From his own hand we have a contribution to literature which helps to substantiate this conception of his character. A large part of Giotto’s fame as painter was won in the service of the Franciscans, and in the pictorial celebration of the life and ordinances of
their founder. As is well known, it was a part of the ordinances of Francia that his disciples should follow his own example in worshipping and being wedded to poverty,—poverty idealized and personified as a spiritual bride and mistress. Giotto, having on the commission of the order given the noblest pictorial embodiment to this and other aspects of the Franciscan doctrine, presently wrote an ode in which his own views on poverty are expressed; and in this he shows that, if on the one hand his genius was at the service of the ideals of his time, and his imagination open to their significance, on the other hand his judgment was shrewdly and humorously awake to their practical dangers and exaggerations.

GIPSIES, or GYPSIES, or wandering folk scattered through every European land, over the greater part of western Asia and Siberia; found also in Egypt and the northern coast of Africa, in America and even in Australia. No correct estimate of their numbers outside of Europe can be given, and even in Europe the information derived from official statistics is often contradictory and unreliable. The only country in which the figures have been given correctly is Hungary. In 1893 there were 274,940 in Transylvania, of whom 243,432 were settled, 25,406 only partly settled and 8586 nomads. Of these 91,603 speak a dialect of Italian, 29,137 a dialect of Hungarian and 18,778 other languages. The last has actually been assimilated. Next in numbers stands Rumania, the number varying between 250,000 and 200,000 (1893). Turkey in Europe counted 117,000 (1903), of whom 51,000 were in Bulgaria and Eastern Rumelia, 22,000 in the vilayet of Adrianople and 2500 in the vilayet of Kossovo. In Asiatic Turkey the estimate varies between 67,000 and 200,000. Servia has 41,000; Bosnia and Herzegovina, 18,000; Greece, 10,000; Austria (Cisleithania), 16,000, of whom 13,500 are in Bohemia and Moravia; Germany, 2000; France, 2000 (5000?); Basque Provinces, 500 to 700; Italy, 52,000; Spain, 40,000; Russia, 58,000; Poland, 15,000; Sweden and Norway, 1500; Denmark and Holland, 5000; Persia, 15,000; Transcaucasia, 3000. The rest is mere guesswork. For Africa, America and Australia the numbers are estimated between 135,000 and 166,000. The estimate given by Miklosich (1873) of 700,000 fairly agrees with the above statistics. No statistics are forthcoming for the number in the British Isles. Some estimate their number at 12,000.

The Gipsies are known principally by two names, which have been modified by the nations with whom they came in contact, but which can easily be restored to the names which they bear in their own country. The latter are Azizan or Azigan, which becomes in time Tshingain (Turkish and Greek), Tsigan (Bulgarian, Servian, Rumanian), Csigan (Hungarian), Ziguner (German), Zigari (Italian), and it is not unlikely that the English word Tinker or Tinkler (the latter due to a popular etymology connecting the gaudy gipsy with the tinkling colt or metal wires which he carried on his back as a smith and tinker) may be a local transformation of the German Zigumer. The second name, partly known in the East, where the word, however, is used as an expression of contempt, whilst Zigan is not felt by the gipsies as an insult, is Egyptian; in England, Gipsy; in some German documents of the 16th century Aegyptier; Spanish Gitano; modern Greek Gyphatos. They are also known by the parallel expressions Faraon (Rumanian) and Phara Nepeka (Hungarian) or Pharaoh's people, which are only variations connected with the Egyptian origin. In France they are known as Bohémiens, a word the importance of which will appear later. To the same category belong other names bestowed upon them, such as Walachi, Saracen, Agareni, Nubiani, &c. They were also known by the name of Tartars, given to them in Germany, or as Heathen, Heydens. All these latter must be considered as nicknames without thereby denoting their probable origin. The same may have now been the case with the first name with which they appear in history, Astigon. Much ingenuity has been displayed in attempts to explain the name, for it was felt that a true explanation might help to settle the question of their origin and the date of their arrival in Europe. Here again, two extreme theories have been propounded, the one supported by Bataillard, who connected them with the Siphnoi of Herodotus and identified them with the Komodromoloi of the later Byzantine writers, known already in the 6th century. Others bring them to Europe as late as the 14th century; and the name has also been explained by de Goeje from the Persian Changa, a kind of harp or zither, or the Persian Zang, black, swarthy. Rienzi (1832) and Trump (1872) have connected the name with the Changars of North-East India, but all have omitted to notice that the real form was Atzigon (or more correct) Atzigan and not Tsigan. The best explanation remains that suggested by Miklosich, who derives the word from the Asthingani, a name originally belonging to a peculiar heretical sect living in Asia Minor near Phrygia and Lycaonia, known also as the Melki-Zedekites. The members of this sect observed very strict rules of purity, as they were afraid to be defiled by the touch of other people whom they considered unclean. They therefore acquired the name of Athingani (i.e., "Touch-me-not").

Miklosich has collected seven passages where the Byzantine historians of the 9th century describe the Athingani as soothsayers, magicians and serpent-charmers. From these explanations nothing definite can be proved as to the identity of the Athingani with the Gipsies, or the reason why this name was given to soothsayers, charmers, &c. But the inner history of the Byzantine empire of that period may easily give a clue to it and explain how it came about that such a nickname was given to a new sect or to a new race which suddenly appeared in the Greek Empire at that period. In the history of the Church we find them mentioned in one breath with the Paulicians and other heretical sects which were transplanted in their tens of thousands from Asia Minor to the Greek empire and settled especially in Rumelia, near Adrianople and Philippopolis. The Greeks called these heretical sects by all kinds of names, derived from ancient Church traditions, and gave to each sect such names as first struck them, on the scantiest of imaginary similarities. One sect was called Paulician, another Melki-Zedekite; so also these were called Athingani, probably being considered the descendants of the outcast Samer, who, according to ancient tradition, was a goldsmith and the maker of the Golden Calf in the desert. For this sfn Samer was banished and compelled to live apart with his own people to avoid their touch. (Athingani: "Touch-me-not"). Travelling from East to West these heretical sects obtained different names in different countries, in accordance with the local traditions or to imaginary origins. The Bogomils and Pataranes became Bulgarians in France, and so the gypsies Bohémians, a name which was also connected with the heretical sect of the Bohemian brothers (Böhmishe Brüder). Curiously enough the Kutzto-Vlachs living in Macedonia (q.e.) and Rumelia are also known by the nickname Tsintsari, a word that has not yet been explained. Very likely it stands in close connection with Zigari, the name having been transferred from one people to the other without the justification of any common ethnic origin, except that the Kutzto-Vlachs, like the Zigari, differed from their Greek neighbours in race, as in language, habits and customs; while they probably followed similar pursuits to those of the Zigari, as smiths, &c. As to the other name, Egyptians, this is derived from a peculiar tale which the gipsies spread when appearing in the west of Europe. They alleged that they had come from a country of their own called Little Egypt, either a confusion between Little Armenia and Egypt or the Peloponnese.

Attention may be drawn to a remarkable passage in the Syrian version of the apocryphal Book of Adam, known as the Case of Treasures and compiled probably in the 6th century: "And
of the seed of Canaan were as I said the Egyptians; and, lo, they were scattered all over the earth and served as slaves of slaves” (ed. Bezold, German translation, p. 25). No reference to such a scattering and servitude of the Egyptians is mentioned anywhere else. This must have been a legend, current in Asia Minor, and hence probably transferred to the swarthy Gipsies.

A new explanation may now be ventured upon as to the name which the Gipsies of Europe give to themselves, which, it must be Gipsies when not only the origin of the Gipsies outside of Europe. Only those who starting from the ancient Byzantine empire have travelled westwards and spread over Europe, America and Australia call themselves by the name of Rom, the woman being Romni and a stranger Gaž. Many etymologies have been suggested for the word Rom. Paspati derived it from the word Droma (Indian), and Miklosich had identified it with Đoma or Đomba, a “low caste musician,” rather an extraordinary name for a nation to call itself by. Having no home and no country of their own and no political traditions and no literature, they would naturally try to identify themselves with the people in whose midst they lived, and would call themselves by the same name as other inhabitants of the Greek empire, known also as the Empire of New Rom, or of the Romai, Romeliot, Romanoi, as the Byzantines used to call themselves before they assumed the prouder name of Hellenes. The Gipsies would therefore call themselves also Rom, a much more natural name, more flattering to their vanity, and geographically and politically more correct than if they called themselves “low caste musicians.” This Greek origin of the name would explain why it is limited to the European Gipsies, and why it is not found among that stock of Gipsies which has migrated from Asia Minor southwards and taken a different route to reach Egypt and North Africa.

Appearance in Europe.—Leaving aside the doubtful passages in the Byzantine writers where the Athinganoi are mentioned, the first appearance of Gipsies in Europe cannot be traced positively further back than the beginning of the 14th century. Some have hitherto believed that a passage in what was erroneously called the Rhymed Version of Genesis of Vienna, but which turns out to be the work of a writer before the year 1232, and found only in the Klagenfurt manuscript (edited by Ditmar, 1862), referred to the Gipsies. It runs as follows: Gen. xlix. 15—“Hagar had a son from whom were born the Chaltsmide. When Hagar had that child, she named it Ismael, from whom the Ismaelites descend who journey through the land, and we call them Chaltsmide, may evil befall them! They sell only things with blemishes, and for whatever they sell they always ask more than its real value. They cheat the people to whom they sell. They have no home, no country. Their houses, their tents, they wander over the country, they deceive the people, they cheat men but rob no one noiselessly.”

This reference to the Chaltsmide (not goldsmiths, but very likely ironworkers, smiths) has wrongly been applied to the Gipsies. For it is important to note that at least three centuries before historical evidence proves the immigration of the genuine Gipsy, there had been waylarding smiths, travelling from country to country, and practically paving the way for their successors, the Gipsies. These had taken up the same vocation, and have also assimilated a good proportion of these vagrants of the west of Europe. The name given to the former, who probably were Oriental or Greek smiths and pedlars, was then transferred to the new-comers. The Komodromoi mentioned by Theophanes (728-818), who speaks under the date 554 of one hailing from Italy, and by other Byzantine writers, are no doubt the same as the Chaltsmide of the German writer of the 12th century translated by Ducas as Chaudroniers. We are certain that a legate of the pope in the 14th century, Hopt, has proved the existence of Gipsies in Corfu before 1240. Before 1246 the empress Catherine de Valois granted to the governor of Corfu authority to reduce to vassalage certain vagrants who came from the mainland; and in 1386, under the Venetians, they formed the Feudum Acidanorum, which lasted for many centuries. About 1378 the Venetian governor of Nauplia confirmed to the “Acingani” of that colony the privileges granted by his predecessor to their leader John. It is even possible to identify the people described by Friar Simon in his Itinerarium, who, speaking of his stay in Crete in 1322, says: “We saw there a people outside the city who declare themselves to be of the race of Ham and who worship according to the Greek rite. They wander like a cursed people from place to place, not stopping at all or rarely in one place longer than thirty days; they first take to tents in a forest on the side of a mountain, then bundle their belongings.”

But their name is not mentioned, and although the similarity is great between these “children of Ham” and the Gipsies, the identification has only the value of an hypothesis. By the end of the 13th century they must have been settled for a sufficiently long time in the Balkan Peninsula and the countries north of the Danube, such as Transylvania and Walachia, to have been reduced to the same state of serfdom as they evidently occupied in Corfu in the second half of the 14th century. The vozvode Mircea I. of Walachia confirms the grant made by his uncle Vladislav Vozvode to the monastery of St Anthony of Voldisa as to forty families of “Atasgane,” for whom no taxes should be paid to the prince. They were considered crown property. The same gift is renewed in the year 1424 by the vozvode Dan, who repeats the very same words (i Acigâne, m, čeludi. da su. slobodni ot vtskhi rabot i dankov) (Hajduč, Arhiva, i. 20). At that time there must already have been in Walachia settled Gipsies treated as serfs, and migrating Gipsies plying their trade as smiths, musicians, dancers, soothsayers, horse-dealers, &c., for we find the vozvode Alexander of Moldavia granting these Gipsies in the year 1478 “freedom of air and soil to wander about and free fire and iron for their smithy.” But a certain portion, probably the largest, became serfs, who could be sold, exchanged, bartered and inherited. It may be mentioned here that in the 17th century a family when sold fetched forty Hungarian florins, and in the 18th century the price was sometimes as high as 700 Rumanian piastres, about 8½-shirts. As late as 1845 an auction of 200 families of Gipsies took place in Bucharest, where they were sold in batches of no less than 5 families and offered at a “ducat” cheaper per head than elsewhere. The Gipsies followed at least four distinct pursuits in Rumania and Transylvania, where they lived in large masses. A goodly proportion of them were tied to the soil; in consequence their position was different from that of the Gipsies who had started westwards and who are nowhere found to have obtained a permanent abode for any length of time, or to have been treated, except for a very short period, with any consideration of humanity. Their appearance in the West is first noted by chroniclers early in the 15th century. About 1414 they are said to have already arrived in Hesse. This date is contested, but for 1417 the reports are unanimous of their appearance in Germany. Some count their number to have been as high as 1,400, which of course is exaggeration. In 1428 they reached Hamburg, 1419 Augsburg, 1428 Switzerland. In 1427 they had already entered France (Provence). A troupe is said to have reached Bologna in 1422, whence they are said to have gone to Rome, on a pilgrimage alleged to have been undertaken for some act of apotheosis. After this they returned and later seem to have again followed in its wake, led by Zumbl. The Gipsies spread over Germany, Italy and France between the years 1438 and 1532. About 1500 they must have reached England. The 5th of July 1505 James IV. of Scotland gave to “Antonius Gaginae,” count of Little Egypt, letters of recommendation to the king of Denmark; and special privileges were granted by James V. on the 15th of February 1540 to “our loyal Johanne Faw Lord and Erle of Littell Egypt,” to whose son and successor he granted authority to hang and punish all Egyptians within the realm (May 26, 1540).

It is interesting to hear what the first writers who witnessed their appearance have to tell us; for ever since the Gipsies have remained the same. Albert Kranzisz (Krantz), in his Saxonia (xi. 2), was the first to give a full description, which was afterwards repeated by Munster in his Cosmographia (iii. 5).
He says that in the year 1471 there appeared for the first time in Germany a people uncoolc, black, dirty, barbarous, called in Italian “Ciani,” who indulge specially in thieving and cheating. They had among them a count and a few knights well dressed, others followed afoot. The women and children travelled in carts. They also carried with them letters of safeconduct from the emperor Sigismund and other princes, and they professed that they were engaged on a pilgrimage of expiation for some act of apostasy.

The guilt of the Gipsies varies in the different versions of the story, but all agree that the Gipsies asserted that they came from one of their own country called “Lilit Egypt,” and they had to go to Rome, to obtain pardon for that alleged sin of their forefathers. According to one account it was because they had not shown mercy to Joseph and Mary when they had sought refuge in Egypt from the persecution of Herod (Basil Chronicle). According to another, because they had forsaken the Christian faith for a while (Rhaetia, 1656), &c. But these were fables, no doubt connected with the legend of Cartaphilus or the Wandering Jew.

Krantz’s narrative continues as follows: This people have no country and travel through the land. They live like dogs and have no religion although they allow themselves to be baptized in the Christian faith. They live without care and gather unto themselves also other vagrants, men and women. Their old women practise fortune-telling, and whilst they are telling men of their future they pick their pockets. Thus far Krantz. It is curious that he should use the name by which these people were called in Italy, “Ciani.” Similarly Crusius, the author of the Annales Suevici, knows their Italian name Ziganis and the French Bohemiens. Not one of these oldest writers mentions them as coppersmiths or farriers or musicians. The immunity which they enjoyed during their first appearance in western Europe is due to the letter of safe-conduct of the emperor. As it is of extreme importance for the history of civilization as well as the history of the Gipsies, it may find a place here. It is taken from the compilation of Felix Ocelius, Rerum Bohemiens (Augsburg, 1758), ii. 15, who reproduces the “Diarium sexenale” of “Andreas Presbyter,” the contemporary of the first appearance in Germany.

“Sigismundus Dei gratia Romanorum Rex semper Augustus, ac Hungariae, Bohemiae, Dalmatiae, Croatae, &c. Rex Fidelibus nostris universis Nobilibus, Militibus, Castellanis, Officialibus, Tributariis, civitatibus liberis, opitis et eorum judicibus in Regno et sub domino nostro constitutis ex existentiis suis velut ac dilectissimum, Fideles nostris adhuc in praestantiam personarum Ladislaus Wayuoda Ciganorum cum aliis ab ipsius spectantibus, nobis humilimas procerorum supplicationes, huc in sepsus in nostra praestantia supplicacionum precum cum instantia, ut ipsas gratia nostra uteriberi providere dignaremur. Unde nos illorum supplicationis ille eisidem hanc libertatem duximus concedendam, qua re quandocunque idem Ladislaus Wayuoda et sua gens ad dicta nostra dominia videlice civitates vel oppida pervenirent, ut tunc vestris fideltatibus praesentibus firmiter committimus et mandamus ut eosdem Ladislaus Wayuodam et Ciganos sibi subjiciant omni sini impedimento ac perturbatione, quam solet foree ac consuetudine acnulla ab omnis impairmentibus seu offenderibus tueri velitis: Si autem inter ipsos aliqua Zizania seu perturbationi evenire ex parte, quorumcumque ex tunc non vos nec aliquis alter vastrum, sed idem Ladislaus Wayuoda iudicandi et liberandi habet facultatem. Praesentes autem post eorum lecturam semper reddi iubemus praesentant.

“Datum in Pepus Domino die ante festum St Georgii Martyris Anno Domini MCCCLXXIII, Regnorum nostrorum anno Hic XXVIII, Voranorum vertio.

Freely translated this reads: “We Sigismund by the grace of God emperor of Rome, king of Hungary, Bohemia, &c. unto all true and loyal subjects, noble soldiers, commanders, castellans, open districts, free towns and their judges in our kingdom established and under our sovereignty, kind greetings. Our faithful vovode of the Tsigani with others belonging to him has humbly requested us that we might graciously grant them our abundant favour. We grant them their supplication, we have vouchsafed unto them this liberty. Whenever therefore this vovode Ladislaus and his people should come to any part of our realm in any town, village or place, we commit them by these presents, strongly to your loyalty and we command you to protect in every way the same vovode Ladislaus and the Tsigani against without hindrance, and you should show kindness unto them and you should protect them from every trouble and persecution. But should any trouble or discord happen amongst them from whichever side it may be, then none of you nor any-one else belonging to you should interfere, but this vovode Ladislaus alone should have the right of punishing and pardoning. And we moreover command you to return these presents always after having read them. Given in our court on Sunday the day before the Feast of St George in the year of our Lord 1423. The 36th year of our kingdom of Hungary, the 12th of our being emperor of Rome and the 3rd of our being king of Bohemia.”

There is no reason to doubt the authenticity of this document, which is in no way remarkable considering that at that time the Gipsies must have formed a very considerable portion of the inhabitants of Hungary, whose king Sigismund was. They may have presented the emperor’s grant of favours to Alexander prince of Moldavia in 1472, and obtained from him safe-conduct and protection, as mentioned above.

No one has yet attempted to explain the reason why the Gipsies shall have started in the 14th and especially in the first half of the 15th century on their wandering westwards. But if, as has been assumed above, the Gipsies had lived for some length of time in Rumelia, and afterwards spread thence across the Danube and the plains of Transylvania, the incursion of the Turks into Europe, their successive occupation of those very provinces, the overthrow of the Servian and Bulgarian kingdoms and the dislocation of the native population, would account to a remarkable degree for the movement of the Gipsies: and this movement increases in volume with the greater successes of the Turks and with the peopling of the country by immigrants from Asia Minor. The first to be driven from their homes would no doubt be the nomadic element, which felt itself ill at ease in its new surroundings, and found it more profitable first to settle in larger numbers in Walachia and Transylvania and thence to spread to the western countries of Europe. But their immunity from persecution did not last long.

Later History.—Less than fifty years from the time that they emerge out of Hungary, or even from the date of the Charter of the emperor Sigismund, they found themselves exposed to the suspicions and prejudices of the people whose good faith they had abused, whose purses they had lightened, whose barns they had emptied, and on whose credulity they had lived with ease and comfort. Their inborn tendency to roaming made them the terror of the peasantry and the despair of every legislator who tried to settle them on the land. Their foreign appearance, their unknown tongue and their unscrupulous habits forced the legislators of many countries to class them with rogues and vagabonds, to declare them outlaw and felons and to treat them with extreme severity. More than one judicial murder has been committed on the spot, and many of them have been suspected as Turkish spies and treated accordingly, and the murderer of a Gipsy was often regarded as innocent of any crime.

Weissenbruch describes the wholesale murder of a group of Gipsies, of whom five men were broken on the wheel, nine perished on the gallows, and three men and eight women were decapitated. This took place on the 14th and 15th of November 1726. Acts and edicts were issued in many countries from the end of the 15th century onwards sentencing the “Egyptians” to exile under pain of death. Nor was this an empty threat. In Edinburgh four “Fatros” were hanged in 1611 “for abyding within the kingome, they being Egyptianes,” and in 1626 at Haddington the Egyptians were ordered “the men to be hanged and the women to be drowned, and suche of the weomen as her children to be scourgit throw the burg and burnt in the cheeks.” The burning on the cheek or on the back was a common penalty.
In 1692 four Estremadura Gipsies caught by the Inquisition were charged with cannibalism and made to own that they had eaten a friar, a pilgrim and even a woman of their own tribe, for which they suffered the penalty of death. And as late as 1782, 45 Hungarian Gipsies were charged with a similar monstrous crime, and when the supposed victims of a supposed murder could not be found from the beginning of their settlement they ordered under torture and said on the rack, "We ate them." Of course they were forthwith beheaded or hanged. The emperor Joseph II., who was also the author of one of the first edicts in favour of the Gipsies, and who abolished serfdom throughout the Empire, ordered an inquiry into the incident; it was then discovered that no murder had been committed, except that of the victims of this monstrous accusation.

The history of the legal status of the Gipsies, of their treatment, in various countries and of the penalties and inflictions to which they have been subjected, would form a remarkable chapter in the history of modern civilization. The materials are slowly accumulating, and it is interesting to note as one of the latest instances, that not further back than the year 1907 a "drive" was undertaken in Germany against the Gipsies, which fact may account for the appearance of some German Gipsies in England in that year, and that in 1904 the Prussian Landtag adopted unanimously a proposition to examine anew the question of granting peddling licences to German Gipsies; that on the 17th of February 1906 the Prussian minister issued special instructions to combat the Gipsy nuisance; and that in various parts of Germany and Austria a special register is kept for the tracing of the genealogy of vagrant and sedentary Gipsy families.

Different has been the history of the Gipsies in what originally formed the Turkish empire of Europe, notably in Rumania, i.e. Walachia and Moldavia, and a careful search in the archives of Rumania would offer rich materials for the history of the Gipsies in a country where they enjoyed exceptional treatment almost from the beginning of their settlement. They were divided mainly into two classes, (1) Robi or Serfs, who were settled on the land and deprived of all individual liberty, being the property of the nobles and of churches or monastic establishments, and (2) the Nomadic vagrants. They were subdivided into four classes according to their occupation, such as the Lingurari (woodcarvers; lit. "spoonmakers"), Caldarari (tinkers, coppersmiths and ironworkers), Ursari (lit. "bear drivers") and Rudari (miners), also called Aurari (gold-washers), who used formerly to wash the gold out of the auriferous rivers of Wallachia. A separate and smaller class consisted of the Gipsy Lasha or Vatrashi (settled on a homestead or "having a fireplace" of their own). Each skhara or Gipsy community was placed under the authority of a judge or leader, known in Rumania as jude, in Hungary as agh; these officials were subordinate to the bulubasha or voivod, who was himself under the direct control of the yabasha (or governor appointed by the prince from among his nobles). The yabasha was responsible for the regular income to be derived from the vagrant Gipsies, who were considered and treated as the prince's property. These voivodi or yabashhi who were not Gipsies by origin often treated the Gipsies with great tyranny. In Hungary down to 1648 they belonged to the aristocracy. The last Polish Krolewstwo czyganskie or Gipsy king died in 1790. The Robi could be bought and sold, freely exchanged and inherited, and were treated as the negroes in America down to 1856, when their final freedom in Moldavia was proclaimed. In Hungary and in Transylvania the abolition of servitude in 1781-1782 carried with it the freedom of the Gipsies. In the 18th and 19th centuries many attempts were made to settle and to educate these nomads, who were depopulated in Austria this was undertaken by the empress Maria Theresa, and the emperor Francis II. (1761-1783), in Spain by Charles III. (1788). In Poland (1791) the attempt succeeded. In England (1827) and in Germany (1830) societies were formed for the reclamation of the Gipsies, but nothing was accomplished in either case. In other countries, however, definite progress was made. Since 1866 the Gipsies have become Rumanian citizens, and the latest official statistics no longer distinguish between the Rumanians and the Gipsies, who are becoming thoroughly assimilated, forgetting their language, and being slowly absorbed by the native population. In Bulgaria the Gipsies were declared citizens, enjoying equal political rights in accordance with the treaty of Berlin in 1878, but through an arbitrary interpretation they were deprived of that right, and on the 6th of January 1906 the Rumanian government declared all Gipsies to be incapable of claiming political rights for the Turkish Gipsies or Gopil as they call them.

The Origin and Language of the Gipsies.—The real key to their origin is, however, the Gipsy language. The scientific study of that language began in the middle of the 19th century with the work of Pott, and was brought to a high state of perfection by Miklosh. From that time on monographs have multiplied and minute researches have been carried on in many parts of the world, all tending to elucidate the true origin of the Gipsy language. It must remain for the time being an open question whether the Gipsies were originally a pure race. Many a strange element has contributed to swell their ranks and to introduce discordant elements into their vocabulary. Ruediger (1782), Grellmann (1783) and Marden (1783) almost simultaneously and independently of one another came to the same conclusion, that the language of the Gipsies, until then considered a thieves' jargon, was in reality a language closely allied with some Indian speech. Since then the two principal problems to be solved have been, firstly, to which of the languages of India the original Gipsy speech was most closely allied, and secondly, by which route the people speaking that language had reached Europe and then spread westwards. Despite the rapid increase in the number of Gipsy investigators, no solution has yet been found to the first problem, nor is it likely to be found. For the language of the Gipsies, as shown by recent studies of the Armenian Gipsies, has undergone such a profound change and involves so many difficulties, that it is impossible to compare the modern Gipsy with any modern Indian dialect owing to the inner developments which the Gipsy language has undergone in the course of centuries. All that is known, moreover, of the Gipsy language, and all that rests on reliable texts, is quite modern, scarcely earlier than the middle of the 19th century. Followed up in the various dialects into which it has split, it shows such a thorough change from dialect to dialect, that except as regards general outlines and principles of inflection, nothing would be more misleading than to draw conclusions from apparent similarities between Gipsy, or any Gipsy dialect, and any Indian language; especially as the Gipsies must have been separated from the Indian races for a much longer period than has elapsed since their arrival in Europe and since the formation of their European dialects. It must also be borne in mind that the Indian languages have also undergone profound changes of their own, under influences totally different from those to which the Gipsy language has been subjected. The problem would stand differently if by any chance an ancient vocabulary were discovered representing the oldest form of the common stock from which the European dialects have sprung; for there can be no doubt of the unity of the language of the European Gipsies. The question whether Gipsy stands close to Sanskrit or Prakrit, or shows forms more akin to Hindi dialects, especially those of the North-West front, or Dardestan and Kafiristan, to which may be added the dialects of the Pielro language (Grierson, 1906), is affected by the fact established by Fink that the dialect of the Gipsies in Armenia shows much closer resemblance to Prakrit than the language of the European Gipsies, and that the dialects of Gipsy spoken throughout Syria and Asia Minor differ profoundly in every respect from the European Gipsy, taken as a whole spoken. The only explanation possible is that the European Gipsy represents the first wave of the Westward movement of an Indian tribe or caste which, relocated
GIPSYES

at a certain period by political disturbances, had travelled through Persia, making a very short stay there, thence to Armenia staying a little longer, and then possibly to the Byzantine Empire at an indefinite period between 1100 and 1200; and that another clan had followed in their wake, passing through Persia, settling in Armenia and then going farther down to Syria, Egypt and North Africa. These two tribes though of a common remote Indian origin must, however, be kept distinctly apart from the Gipsies of the local faith. As they everywhere rank each other in the same relation as they stand to the various dialects in India. The linguistic proof of origin can therefore now not go further than to establish the fact that the Gipsy language is in its very essence an originally Indian dialect, enriched in its vocabulary from the languages of the peoples among whom the Gipsies had sojourned, whilst in its grammatical inflection it has slowly been modified, to such an extent that in some cases, like the English or the Servian, barely a skeleton has remained.

Notwithstanding the statements to the contrary, a Gipsy from Greece or Rumania could no longer understand a Gipsy of England or Germany, so profound is the difference. But the words which have entered into the Gipsy language, borrowed as they were from the Greeks, Hungarians, Rumanians, &c., are not only an indication of the route taken—and this is the only use that has hitherto been made of the vocabulary—but they are of the highest importance for fixing the time when the Gipsies had come in contact with these languages. The absence of Arabic is a positive proof that not only did the Gipsies not come into Arabia (as maintained by De Goeje) before they reached Europe, but that they could not even have been living for any length of time in Persia after the Mahomedan conquest, or at any rate that they could not have come in contact with such elements of the population as had already adopted Arabic in addition to Persian. But the form of the Persian words found among European Gipsies, and similarly the form of the Armenian words found in that language, are a clear indication that the Gipsies could not have come in contact with these languages before Persia had assumed its modern form and before Armenian had been changed from the old to the modern form of language. Still more strong and clear is the evidence in the case of the Greek and Rumanian words. If the Gipsies had lived in Greece, as some contend, from very ancient times, some at least of the old Greek words would be found in their language, and similarly the Slavonic words would be of an archaic character, whilst on the contrary we find medieval Byzantine forms, nay, modern Greek forms, among the Gipsy vocabulary collected from Gipsies in Germany or Italy, England or France; a proof positive that they could not have lived in Europe much earlier than the approximate dates given above of the 11th or 12th century. We then find from a grammatical point of view the same deterioration, say among the English or Spanish Gipsies, as has been noticed in the Gipsy dialect of Armenia. It is no longer Gipsy, but a corrupt English or Spanish adapted to some remnants of Gipsy inflections. The purest form has been preserved among the Greek Gipsies and to a certain extent among the Rumanian. Notably through Miklosich's researches and comparative studies, it is possible to place the Gipsy tribes step by step back to the home of their ancestors. That, as far as Europe is concerned, the language of these Gipsies was one and the same, and that it was slowly split up into a number of dialects (13 Miklosich, 14 Colocci) which shade off into one another, and which by their transitional forms mark the way in which the Gipsies have travelled, as also proved by historical evidence. The Welsh dialect, known by few, has retained, through its isolation, some of the ancient forms.

Religion, Habits and Customs.—Those who have lived among the Gipsies will readily testify that their religious views are a strange medley of the local faith, which they everywhere embrace, and some old-world superstitions which they have in common with many nations. Among the Greeks they belong to the Greek Church, among the Mahomedans they are Mahomedans, in Rumania they belong to the National Church. In Hungary they are mostly Catholics, according to the faith of the inhabitants of that country. They have no ethical principles and they do not recognize the obligations of the Ten Commandments. There is extreme moral laxity in the relation of the two sexes, and on the whole they take life easily, and are complete fatalists. At the same time they are great cowards, and they play the rôle of the fool or the jester in the popular anecdotes of eastern Europe. There the poltroon is always a Gipsy, but he is good-humoured and not unscrupulous, as those Gipsies who had endured the hardships of outlawry in the west of Europe.

There is nothing specifically of an Oriental origin in their religious vocabulary, and the words Devia (God), Bang (devil) or Trushel (Cross), in spite of some remote similarity, must be taken as later adaptations, and not as remnants of an old Sky-worship or Serpent-worship. In general their beliefs, customs, tales, &c. belong to the common stock of general folklore, and many of their symbolical expressions find their exact counterpart in Rumanian and modern Greek, and often read as if they were direct translations from these languages. Although they love their children, it sometimes happens that a Gipsy mother will hold her child by the legs and beat the father with it. In Rumania and Turkey among the settled Gipsies a good number are carriers and bricklayers; and the women take their full share in every kind of work, no matter how hard it may be. The nomadic Gipsies carry on the ancient craft of coppersmiths, or workers in metal; they also make sieves and traps, but in the East they are seldom farriers or horse-dealers. They are far-famed for their music, in which art they are unsurpassed. The Gipsy musicians belong mostly to the class who originally were cooks. They were retained at the courts of the boyars for their special talent in reciting old ballads and love songs and their dexterity in playing, notably the guitar and the fiddle. The former was used as an accompaniment to the singing of either love ditties and popular songs or more especially in recital or heroic ballads and epic songs; the latter for dances and other amusements. They were the troubadours and minstrels of eastern Europe; the largest collection of Rumanian popular ballads and songs was gathered by G. Dem. Teodorescu from a Gipsy minstrel, Petre Shołkan; and not a few of the songs of the guslars among the Servians and other Slavonic nations in the Balkans come also from the Gipsies. They have also retained the ancient tunes and airs, from the dreamy "doima" of the Rumanian to the fiery "czardas" of the Hungarian or the stately "horn" of the Bulgarian. Liszt went so far as to ascribe to the Gipsies the origin of the Hungarian national music. This is an exaggeration, as seen by the comparison of the Gipsy music in other parts of south-east Europe; but they undoubtedly have given the most faithful expression to the national temperament. Equally famous are the Gipsy tales for her knowledge of occult, magic and fairy tales, and the belief in the real witch; she knows charms to injure the enemy or to help a friend. She can break the charm if made by others. But neither in the one case nor in the other, and in fact as little as in their songs, do they use the Gipsy language. It is either the local language of the natives as in the case of charms, or a slightly Romanized form of Greek, Rumanian or Slavonic. The old Gipsy woman is also known for her skill in palmistry and fortune-telling by means of a special set of cards, the well-known Tarok of the Gipsies. They have also a large stock of fairy tales and she weaves each one of her tales with skill and faithfulness with the Greek, and in Rumania with the Rumanian fairy tales. It is doubtful, however, whether they have contributed to the dissemination of these tales throughout Europe, for a large number of Gipsy tales can be shown to have been known in Europe long before the appearance of the Gipsies, and others are so much like those of other nations that the borrowing may be by the Gipsy from the Greek, Slav or Rumanian. It is, however, possible that playing-cards might have been introduced to Europe through the Gipsies. The oldest reference to cards is found in the Chronicle of Nicolaus of Cuesolazzo, who says that the cards were first brought into Viterbo in 1378 from the land of the Saracens, probably from Asia Minor or the Balkans. They spread very quickly, but no one has been able as yet to trace definitely the source whence they were first brought. Without
entering here into the history of the playing-cards and of the different forms of the faces and of the symbolical meaning of the different designs, one may assume safely that the cards, before they were used for mere pastime or for gambling, may originally have had a mystical meaning and been used as sorts in various combinations.

To this very day the oldest form is known by the hitherto unexplained name of Tarock, played in Bologna at the beginning of the 15th century. By the 16th century it is certain that the form Tarot, connected direct with the Gipsies, "Le Tarot des Bohémiens." It was noted above that the oldest chronicler (Presbyter) who describes the appearance of the Gipsies in 1416 in Germany knows them by their Italian name "Ciganos," so evidently must he have known of their existence in Italy previous to any date recorded hitherto anywhere, and it is therefore not impossible that coming from Italy they brought with them also their book of divination.

"Physical Characteristics." - As a race they are of small stature, varying in colour from the dark tan of the Arab to the whitish hue of the Servian and the Pole. In fact there are some white-coloured Gipsies, especially in Servia and Dalmatia, and these are often not easily distinguishable from the native peoples, except that they are more lithe and sinewy, better proportioned and more agile in their movements than the thick-set Slavs and the mixed race of the Rumanians. By one feature, however, they are easily distinguishable and recognize one another, viz., by the lustre of their eyes and the whiteness of their teeth. Some are almost mongrels, and among the smaller Châtaigniers there is no doubt to intermarry with outcasts of other races.

The women age very quickly and the mortality among the Gipsies is great, especially among children; among adults it is chiefly due to pulmonary diseases. They love display and Oriental showiness, bright-coloured dresses, ornaments, bangles, &c.; red and green are the colours mostly favoured by the Gipsies in the East. Along with a showy handkerchief or some shining gold coins round their necks, they will wear torn petticoats and no stockings. After they have been assimilated and have forgotten their original language they still retain some of the prominent features of their character, such as the love of inordinate display and gorgeous dress; and their moral defects not only remain for a long time as glaring as among those who live the life of vagrants, but even become more pronounced. The Gipsy of to-day is no longer what his forefathers have been. The assimilation with the nations in the near East and the steps taken for the suppression of vagrancy in the West, combine to denationalize the Gipsy and to make Roman Chibb a thing of the past.

Bibliography. - The scientific study of the Gipsy language and its social and political history has been the object of Mr. Borrow, and the critical edition of their race dates (with the notable exception of Grellmann) almost entirely from Pott's researches in 1844.

I. Collections of Documents, &c. - Lists of older publications appear in the works of Pott, Miklosich and the archduke Joseph; Pott adds a critical appreciation of the scientific value of the books enumerated. See also Versuch von Werkten und Aufsatzen... über die Geschichte und Sprache der Gysinger, &c. 248 entries (Leipzig, 1886); J. Trepary, "Adal’estk a czigányokról szóld fiorodobolv." in Magyar Konyvmegye (Budapest, 1877); Ch. G. Leland, A Collection of Cuttings... relating to Gipsies (1874-1841), bequeathed by him to the Bibliothèque Nationale. See also the Orientalischer Jahresbericht, ed. Müller (Berlin, 1887 ff.).

II. History. - (a) The first appearance of the Gipsies in Europe. Sources: O. Oechssler, Rerum Bururum scriptores, &c. (Augsburg, 1753); M. Freger, Andrease Preblicof... chronicon de dutubus Bonarios... (1602); S. Munster, Cosmographia... &c. (Basel, 1545); J. Thurner, Annalium Bolomeri vii septem, ed. T. Ziegler (Ingolstadt, 1654); M. Crissius, Annales Statutici, &c. (Frankfurt, 1595-1606); Schobisch Cheochnik... (Frankfurt, 1733); A. Krantz, Saxonia (Cologne, 1520); Simon Simeon, Itinerarium, &c., ed. J. North, Cambridge, 1778). (b) Origin and spread of the Gipsies. H. M. G. Grellmann, The expansion of the Bururom (1st ed. Leipzig, 1873; 2nd ed., Göttingen, 1877); English by M. Roper (London, 1877; 2nd ed., London, 1878); entitled Dissertation on the Gipsies, &c. (London, 1879), and also in Index Indice, &c. (Leipzig, 1879). - The Gipsies of the Roman Empire... (Königsberg, 1842), a third and greatly improved edition of Grellmann and the best book of its kind up to that date; A. F. Pott, Die Gipsinger in Europa und Asien (2 vols., Halle, 1844-1845), the first scholarly work with complete and critical bibliographical detail, grammatical, etymological dictionary and important scientific texts; C. MacRitchie, Account of the Gipsies of India (London, 1886); Zeller, Universal-Lexicon, vol. iii., x. - Gipsinger, pp. 520-544 concerning their origin and development in Europe. They are first heard of from 1844 to 1885; A. Colacci, Storia d'un popolo errante with illustrations, map and Gipsy-Ital. and Ital.-Gipsy glossaries (Turin, 1886); F. H. Groome, The Gipsies, in E. Magnusson, National geografiska spectand (Stockholm, 1898); Dr. J. P. C. von Hase, Uber die Gipsinger... (Stuttgart, 1898); Ficker, "Die Gipsinger der Bukowina," in Statist. monatschrifti, v. 6, Hundert Jahre 1775-1875: Gipsinger in d. Bukowina (Vienna, 1875), Die Volkskunde der österr.-ungar. Monarchie, v. 3 (Leipzig, 1890); W. O. B. de Silva &c., Die Kauth, v. 1, Die Mac-Ritchie, Scottish Gipsies under the Stewards (Edinburgh, 1894); F. A. Coelho, "Os Ciganos de Portugal," in Bol. Soc. Geog. (Lisbon, 1896); A. Damburton, Gypsy Life in the Mysore Jungle (London, 1902).

IV. Folklore, Tales, Songs, &c. Many songs and tales are found...
in the books enumerated above, where they are mostly accompanied by verbal translations. See also Ch. G. Leland, E. H. Palmer and T. Tuckey, English Gipsy Songs in Romany, with Metrical English Translation (London, 1875); G. Smith, Gipsy Life, &c. (London, 1888); J. Häsel, Die Volkslieder der Zigeuner (1881); Ch. G. Leland, The Gypsies (Boston, Mass., 1882), Gipsy Sorcery and Fortune-Telling (London, 1891); H. von Wislicen, Märchen und Sagen der transsilvanischen Zigeuner (Berlin, 1886)—containing 63 tales, very freely translated; Volkslieder der siebenbürgerischen und südungarischen Zigeuner (Vienna, 1890)—songs, ballads, charms, proverbs and 100 tales; Vom wandernden Zigeunervolke (Hamburg, 1892); J. Heinzen und Wirkungskreis der Zauberei bei den siebenbürgerischen Zigeuner (1891); "Aus dem inneren Leben der Zigeuner," in Ethnologische Mitteilungen (Berlin, 1892); P. Mischel, Bericht über Wislicen vom wandernden Zigeunervolke (Göttingen, 1896)—a study of revealed Wislicen’s method, &c., F. H. Groome, Gipsy Folk-Tales (London, 1890), with historical introduction and a complete and trustworthy collection of 76 gipsy tales from many countries; Katará, Gyógyulások és szegények (1897); M. Gaster, Zigeunermärchen aus Rumänien (1881); "Tiganii, &c.," in Revista pentru Istorie, &c., i. p. 469 ff. (Bucharest, 1883); "Gipsy-Fairy-Tales" in Folklore. The Journal of the Gipsy-Lore Society (Edinburgh, 1888-1902) was revived in Liverpool in 1907.

V. Legal Status. — A few of the books in which the legal status of the Gipsies (either alone or in conjunction with "vagrants") is treated from a juridical point of view are here mentioned, also the history of the trial in 1726. J. B. Weissenbruch, Ausführliche Relation von der fernen Zigeuner-Diebes-Mord und Räuber (Frankfurt and Leipzig, 1727); A. Ch. Thomasain, Traité juridique de vagabondage (1761); R. Molé, Die Gipsyfrage, die deutsche Gaumenschaft, &c. (Leipzig. 1856-1862); V. de Rochas, Les Parias de France et d’Espagne (Paris, 1876); P. Chuchul, Zum Kampfe gegen Landstreicher und Beutler (Kassel, 1883); K. Breunig, Die Zigeuner und der deutsche Staat (Würzburg, 1907); G. Steinhausen, Geschichte der deutschen Kultur (Leipzig and Vienna, 1904). (M. G.)

**GIRAFFE.** A corruption of Zárdjáh, the Arabic name for the tallest of all mammals, and the typical representative of the family Giraffidae, the distinctive characters of which are given in the article Pecora, where the systematic position of the group is indicated. The classic term "camelopard," probably introduced when these animals were brought from North Africa to the Roman amphitheatre, has fallen into complete disuse.

In common with the okapi, giraffes have skin-covered horns on the head, but in these animals, which form the genus *Giraffa*, these appendages are present in both sexes; and there is often an unpaired one in advance of the pair on the forehead. Among other characteristics of these animals may be noted the great length of the neck and limbs, the complete absence of lateral toes and the long and tufted tail. The tongue is remarkable for its great length, measuring about 17 in. in the dead animal, and for its great elasticity and power of muscular contraction while living. It is covered with numerous large papillae, and forms, like the trunk of the elephant, an admirable organ for the examination and prehension of food. Giraffes are inhabitants of open country, and owing to their length of neck and long flexible tongues are enabled to browse on tall trees, mimosas being favourites. To drink or graze they are obliged to straddle the fore-legs apart; but they seldom feed on grass and are capable of going long without water. When standing among mimosa they so harmonize with their surroundings that they are difficult of detection. Formerly giraffes were found in large herds, but persecution has reduced their number and led to their extermination from many districts. Although in late Tertiary times widely spread over southern Europe and India, giraffes are now confined to Africa south of the Sahara.

A distinct species, the reticulated giraffe (*Giraffa reticulata*), characterized by its deep liver-red colour marked with a very coarse network of fine white lines, there are numerous local forms of the ordinary giraffe (*Giraffa camelopardalis*). The northern races, such as the Nubian *G. c. typica* and the Kordofan *G. c. antiquorum*, are characterized by the large frontal horn of the bulls, the white legs, the network type of coloration and the pale tint. The latter feature is specially developed in the Nigerian *G. c. peralta*, which is likewise of the northern type. The Baringo *G. c. reticulata* also has a long frontal horn and white legs, but the spotted pelage is very dark and those of the females jagged. In the Kilimanjaro *G. c. tippelskirchii* the frontal horn is often developed in the bulls, but the legs are frequently spotted to the fetlocks. Farther south the frontal horn tends to disappear more or less completely, as in the Angola *G. c. angolensis*, the Transvaal *G. c. wardi* and the Cape *G. c. capensis*, while the legs are fully spotted and the colour-pattern on the body (especially in the last-named) is more of a blotched type, that

The North African or Nubian Giraffe (*Giraffa camelopardalis*), is to say, consists of dark blotches on a fawn ground, instead of a network of light lines on a dark ground.

For details, see a paper on the subspecies of *Giraffa camelopardalis*, by R. Lydekker in the Proceedings of the Zoological Society of London for 1904. (R. L.*)

**GIRALDI, GILGIO GREGORIO [LIUS GREGORIUS GYRALDUS] (1470-1553).** Italian scholar and poet, was born on the 14th of June 1470, at Ferrara, where he early distinguished himself by his talents and acquirements. On the completion of his literary course he removed to Naples, where he lived on familiar terms with Jovianus Pontanus and Sannazzaro; and subsequently to Lombardy, where he enjoyed the favour of the Mirandola family. At Milan in 1507 he studied Greek under Chalcondylas; and shortly afterwards, at Modena, he became tutor to Ercole (afterwards Cardinal) Rangone. About the year 1514 he removed to Rome, where, under Clement VII., he held the office of apostolic protonotary; but having in the sack of that city (1527), which almost coincided with the death of his patron Cardinal Rangone, lost all his property, he returned in poverty once more to Mirandola, whence again he was driven by the troubles consequent on the assassination of the reigning prince in 1533. The rest of his life was one long struggle with ill-health, poverty and neglect; and he is alluded to with sorrowful regret by Montaigne in one of his *Essais* (i. 34), as having, like Sebastian Castalio, ended his days in utter destitution. He died at Ferrara in February 1552; and his epitaph makes touching and graceful allusion to the sadness of his end. Giraldi was a man of very
extensive erudition; and numerous testimonies to his profundity and accuracy have been given both by contemporary and by later scholars. His *Historia de diis gentium* marked a distinctly forward step in the systematic study of classical mythology; and by his treatises *De annis et mensibus*, and on the *Calendariurn Romanum et Graecum*, he contributed to bring about the reform of the calendar, which, was ultimately effected by Pope Gregory XIII. His *Proygymnasma adversus literaturos* deserves mention at least among the curiosities of literature; and among his other works to which reference is still occasionally made are *Historiae poetarum Graecorum et Latinorum*; *De poetis suorum temporum*; and *De epigraeco vario sepelendi ritu*. Giraldi was also an elegant Latin poet.

His *Opera omnia* were published at Leiden in 1696.

**GIRALDI, GIOVANNI BATTISTA** (1504-1573), surnamed *Cynthus, Cynthio* or *Cintio*, Italian novelist and poet, born at Ferrara in November 1504, was educated at the university of his native town, where in 1525 he became professor of natural philosophy, and, twelve years afterwards, succeeded Celsio Calcagnini in the chair of belles-lettres. Between 1542 and 1560 he acted as private secretary, first to Ercole II. and afterwards to Alfonso II. of Este; but having, in connexion with a literary quarrel in which he had got involved, lost the favour of his patron in the latter year, he removed to Mondovi, where he remained as a teacher of literature till 1568. Subsequently, on the invitation of the senate of Milan, he occupied the chair of rhetoric at Pavia till 1573, when, in search of health, he returned to his native town, where on the 30th of December he died. Besides an epic entitled *Erode* (1557), in twenty-six cantos, Giraldi wrote nine tragedies, the best known of which, *Orbecche*, was produced in 1541. The satirical and disgusting character of the plot of this play, and the general poverty of its style, are, in the opinion of many of its critics, almost fully redeemed by occasional bursts of genuine and impassioned poetry; of one scene in the third act in particular it has even been affirmed that, if it alone were sufficient to decide the question, the *Orbecche* would be the finest play in the world. Of the prose works of Giraldi the most important is the *Hecatommitesi* or *Ecotomites*, a collection of tales told somewhat after the manner of Boccaccio, but still more closely resembling the novels of Giraldi's contemporary Bandello, only much inferior in workmanship to the productions of either author in vigour, liveliness and local colour. Something, but not much, however, may be said in favour of their professed claim to represent a higher standard of morality. Originally published at Montegale, Sicily, in 1565, they were frequently reprinted in Italy, while a French translation by Chappuyus appeared in 1583 and one in Spanish in 1590. They have a peculiar interest to students of English literature, as being furnished, whether directly or indirectly, the plots of *Measure for Measure* and *Othello*. That of the latter, which is to be found in the *Hecatommitesi* (iii. 7), is conjectured to have reached Shakespeare through the French translation; while that of the former (*Hecat.* viii. 5) is probably to be traced to Whistone's *Promos and Cassandra* (1578), an adaptation of Cinthio's story, and to his *Heptameron* (1582), which contains a direct English translation. To Giraldi also must be attributed the plot of *Beaumont and Fletcher's Custom of the Countess*.

**GIRALDUS CAMBRENSIS** (1146-1220), medieval historian, also called *Gerald de Barri*, was born in Pembroke-shire. He was the son of William de Barri and Augharat, a daughter of Gerald, the ancestors of the Fitzgeralds and the Welsh princes, Nesta, formerly mistress of King Henry I. Falling under the influence of his uncle, David Fitzgerald, bishop of St David's, he determined to enter the church. He studied at Paris, and his works show that he had applied himself closely to the study of the Latin poets. In 1172 he was appointed to collect tithe in Wales, and a young monk, living with him in the monastery, was made archdeacon. In 1176 an attempt was made to elect him bishop of St David's, but Henry II. was unwilling to see any one with powerful native connexions a bishop in Wales. In 1180, after another visit to Paris, he was appointed commissary to the bishop of St David's, who had ceased to reside. But Giraldus threw up his post, indignant at the indifference of the bishop to the welfare of his see. In 1184, he was made one of the king's counsellors. He was elected to accompany Prince John on his voyage to Ireland. While there he wrote a *Topographia Hibernica*, which is full of information, and a strongly prejudiced history of the conquest, the *Expugnatio Hibernica*. In 1186 he read his work with great applause before the masters and scholars of Oxford. In 1188 he was sent into Wales with the primate Baldwin to preach the Third Crusade. Giraldus declares that the mission was highly successful; in any case it gave him the material for his *Historia de Cambria*, which is, after the *Expugnatio*, his best known work. He accompanied the archbishop, who intended him to be the historian of the Crusade, to the continent, with the intention of going to the Holy Land. But in 1189 he was sent back to Wales by the king, who knew his influence was great, to keep order among his countrymen. Soon after he was absolved from his crusading vow. According to his own statements, which often tend to exaggeration, he was offered both the sees of Bangor and Llandaff, but refused them. From 1192 to 1198 he lived in retirement at Lincoln and devoted himself to literature. It is probably during this period that he wrote the *Geornica ecclesiastica* (discussing disputed points of doctrine, ritual, &c.) and the *Vita S. Remigii*. In 1198 he was elected bishop of St David's. But Hubert Walter, the archbishop of Canterbury, was determined to have in that position no Welshman who would dispute the metropolitan pretensions of the English primates. The king, for political reasons, supported Hubert Walter. For four years Giraldus exerted himself to get his election confirmed, and to vindicate the independence of St David's from Canterbury. He went three times to Rome. He wrote the *De jure Menevienis ecclesiae* in support of the claims of his diocese. He made alliances with the princes of North and South Wales. He called a general synod of his diocese. He was accused of stirred up rebellion among the Welsh, and the justiciar proceeded against him. At length in 1202 the pope annulled all previous elections, and ordered a new one. The prior of Llantony was finally elected. Gerald was immediately reconciled to the king and archbishop; the utmost favour was shown to him; even the expenses of his unsuccessful election were paid. He spent the rest of his life in retirement, though there was some talk of his being made a cardinal. He certainly survived John.

The works of Giraldus are partly polemical and partly historical. His value as a historian is marred by his violent party spirit; some of his historical tracts, such as the *Liber de instructione principum* and the *Vita Gulfridi Archiepiscopi Eboracensis*, seem to have been designed as political pamphlets. Henry II., Hubert Walter and William Longchamp, the chancellor of Richard I., are the objects of his worst invective. His own pretensions to the see of St David are the motive of many of his misrepresentations. But he is one of the most vivid and witty of our medieval historians.

**GIRANDOLE** (from the Ital. girandola), an ornamental branched candlestick of several lights. It came into use about the second half of the 17th century, and was commonly made and used in pairs. It has always been, comparatively speaking, a luxurious appliance for lighting, and in the great 18th-century period of French house decoration the famous *ciseleurs* designed some exceedingly beautiful examples. A great variety of metals has been used for the purpose—sometimes, as in the case of the candlestick, girandoles have been made in hard woods. Gilded bronze has been a very frequent medium, but for table purposes silver is still the favourite material.
younger children; and after passing through his noviciate he spent some time as an instructor in convents, notably at Wurzburg (1785-1786). The young Girard was chiefly occupied with religious duty. In 1787, full of Kantian ideas, he published an essay outlining a scheme of national Swiss education; and in 1804 he began his career as a public teacher, first in the elementary school at Fribourg (1805-1823), then (being driven away by Jesuit hostility) in the gymnasium at Lucerne till 1834, when he retired to Fribourg and devoted himself with the production of his books on education, *De l’enseignement régulier de la langue maternelle* (1834, 9th ed. 1864; Eng. trans. by Lord Erbington, *The Mother Tongue*, 1847), and *Cours Éducatifs* (1834-1846). His reputation—partly because of his enthusiasm in the cause of education became potent not only in Switzerland, where he was hailed as a second Pestalozzi, but in other countries. He had a genius for teaching, his method of stimulating the intelligence of the children at Fribourg and interesting them actively in learning, and not merely cramming them with rules and facts, being warmly praised by the Swiss educationalist François Naville (1784-1846) in his treatise on public education (1832). His undogmatic method and his Liberal Christianity brought him into conflict with the Jesuits, but his aim was in all his teaching, to introduce the moral idea into the minds of his pupils by familiarizing them with the right or wrong working of the facts he brought to their attention, and thus to elevate character all through the educational curriculum.

GIRARD, PHILIPPE HENRI DE (1775-1849), French mechanician, was born at Lourmarin, Vaucluse, on the 1st of February 1775. He is chiefly known in connexion with flax-spinning machinery. Napoleon having in 1810 decreed a reward of one million francs to the inventor of the best machine for spinning flax, Girard succeeded in producing what was required. But he never received the promised reward, although, in 1835, after his death, a comparatively small pension was voted to his heirs, and having relied on the money to pay the expenses of his invention he got into serious financial difficulties. He was obliged, in 1815, to abandon the flax mills he had established in France, and at the invitation of the emperor of Austria founded a flax mill and a factory for his machines at Hirtzenberg. In 1825, at the invitation of the emperor Alexander I. of Russia, he went to Poland, and erected near Warsaw a flax factory, round which grew up a village which received the name of Giradow. In 1818 he built a steamer to run on the Danube. He did not return to Paris till 1844, where he still found some of his old creditors ready to press their claims, and he died in that city on the 26th of August 1845. He was also the author of numerous minor inventions.

GIRARD, STEPHEN (1758-1831), American financier and philanthropist, founder of Girard College in Philadelphia, was born in a suburb of Bordeaux, France, on the 20th of May 1758. He lost the sight of his right eye at the age of eight and had little education. His father was a sea captain, and the son cruised to the West Indies and back, during 1764-1773, was licensed captain in 1773, visited New York in 1774, and thence with the assistance of a New York merchant began to trade to and from New Orleans and Port au Prince. In May 1776 he was driven into the port of Philadelphia by a British fleet and settled there as a merchant; in June of the next year he married Mary (Polly) Lum, daughter of a shipbuilder, who, two years later, after Girard's becoming a citizen of Pennsylvania (1778), built him for his the "Water Witch," the first of a fleet trading with New Orleans and the West Indies—most of Girard's ships being named after his favourite French authors, such as "Rousseau," "Voltaire," "Helvétius" and "Montesquieu." His beautiful young wife became insane and spent the years from 1790 to her death in 1815 in the Pennsylvania Hospital. In 1810 Girard used about a million dollars deposited by him with the Barings of London for the purchase of shares of the much depreciated stock of the Bank of England, which was afterwards redeemed by the government at a very small price, and subscribed to the United States government in bolstering European confidence in its securities. When the Bank was not rechartered the building and the cashier's house in Philadelphia were purchased at a third of the original cost by Girard, who in May 1812 established the Bank of Stephen Girard. He subscribed in 1814 for about 95% of the government's war loan of $5,000,000, of which only $20,000 besides had been taken, and he generously offered at par shares which upon his purchase had gone to a premium. He pursued his business vigorously in person until the 12th of February 1830, when he was injured in the street by a truck; he died on the 26th of December 1831. His public spirit had been shown during his life not only financially but personally; in 1793, during the plague of yellow fever in Philadelphia, he volunteered to act as manager of the wretched hospital for Bush Helm; and with the assistance of Peter Helm had the hospital cleansed and its work systematized; again during the yellow fever epidemic of 1797-1798 he took the lead in relieving the poor and caring for the sick. Even more was his philanthropy shown in his disposition by will of his estate, which was valued at about $7,500,000, and doubtless the greatest fortune accumulated by any individual in America up to that time. Of his fortune he bequeathed $116,000 to various Philadelphia charities, $500,000 to the same city for the improvement of the Delaware waterfront, $700,000 to Pennsylvania for internal improvements, and the bulk of his estate to Philadelphia, to be used in founding a school or college, in providing a better police system, and in making municipal improvements and lessening taxation. Most of his bequest to the city was to be used for building and maintaining a school "to provide for such a number of poor male white orphan children . . . a better education as well as a more comfortable maintenance than they usually receive from the application of the public funds." His will planned most minutely for the erection of this school, giving details as to the windows, doors, walls, &c.; and it contained the following phrase: "I enjoin and require that no ecclesiastic, missionary or minister of any sect whatsoever, shall ever hold or exercise any duty whatsoever in the said college; nor shall any such person ever be admitted for any purpose, or as a visitor, within the premises appropriated to the purposes of the said college. . . . I desire to keep the tender minds of orphans . . . free from the excitements which clashing doctrines and sectarian controversy are so apt to produce." Girard's heirs-at-law contested the will in 1836, and they were greatly helped by a public prejudice aroused by the clause cited; in the Supreme Court of the United States in 1844 Daniel Webster, appearing for the heirs, made a famous plea for the Christian religion, but Justice Joseph Story handed down an opinion adverse to the heirs (Vidal v. Girard's Executors). Webster was opposed in this suit by John Sergeant and Horace Binney. Girard specified that those admitted to the college must be white male orphans, of legitimate birth and good character, between the ages of six and ten; that no boy was to be permitted to stay after his eighteenth year; and that as regards admissions preference was to be shown, first to orphans born in Philadelphia, second to orphans born in any other part of Pennsylvania, third to orphans born in New York City, and fourth to orphans born in New Orleans. Work upon the buildings was begun in 1833, and the college was opened on the 1st of January 1848, a technical point of law making instruction conditioned upon the completion of the five buildings, of which the principal one, planned by Thomas Ustick Walter (1804-1889), has been called "the most perfect Greek temple in existence." To a sarcophagus in this main building the remains of Stephen Girard were removed in 1851. In the 40 acres of the college grounds there were in 1909 18 buildings (valued at $3,350,000, 1,573 pupils, and a total "population," including students, teachers and all employes, of 1,907. The value of the Girard estate in the year 1907 was $35,000,000, of which $550,000 was devoted to other charities than Girard College. The control of the college was under a board chosen by the city councils until 1869, when by act of the legislature it was transferred to the Philadelphia Common Pleas. Girard College, 10th and Arch Streets, Philadelphia. The course of training is partly industrial—for a long time graduates were indentured till they came of age—but it is also preparatory to college entrance.

**GIRARDIN, GILBERT DE** (1804–1855), French author, was born at Aix-la-Chapelle on the 26th of January 1804. His mother, the well-known Madame Sophie Gay, brought her up in the midst of a brilliant literary society. She published two volumes of miscellaneous pieces, *Essais poétiques* (1824) and *Nouveaux Essais poétiques* (1825). A visit to Italy in 1827, during which she was enthusiastically welcomed by the literati of Rome and even crowned in the capitol, was productive of various poems, of which the most ambitious was *Napoline* (1833). He left Rome with his fiancée, Émiliie de Girardin, and moved up a new literary career. The contemporary sketches which she contributed from 1836 to 1839 to the feuilleton of *La Presse*, under the nom de plume of Charles de Launay, were collected under the title of *Lettres parisiennes* (1843), and obtained a brilliant success. *Contes d'une vieille fille à ses neveux* (1832), *La Canne de Monsieur de Balzac* (1836) and *Il ne faut pas jouer avec la douleur* (1835) are among the best-known of her romances; and her dramatic pieces in prose and verse include *L’École des journalistes* (1840), *Jeanne* (1841), *Chlopicki* (1841), *Jeu de balle* (1843), and several one-act comedies, *C’est la faute du mari* (1851), *La Joie fait peur* (1854), *Le Chapeau d’un horloger* (1854) and *Une Femme qui détaste son mari*, which did not appear till after the author’s death. In the literary society of her time Madame Girardin exercised no small personal influence, and among the frequenters of her drawing-room were Théophile Gautier and Balzac, Alfred de Musset and Victor Hugo. She died on the 29th of June 1855. Her collected works were published in six volumes (1862–1867).

**GIRARDIN, ÉMILE DE** (1802–1881), French publicist, was born, not in Switzerland in 1806 of unknown parents, but (as was recognized in 1837) in Paris in 1802, the son of General Alexandre de Girardin and of Madame Dupuy, wife of a Parisian advocate. His first publication was a novel, *Émile*, dealing with his birth and early life, and appeared under the name of Girardin in 1827. He became inspector of fine arts under the Martignac ministry just before the revolution of 1830, and was an energetic and passionate journalist. Besides his work on the daily press he issued miscellaneous publications which attained an enormous circulation. His *Journal des connaissances utiles* had 120,000 subscribers, and the initial edition of his *Almanach de France* (1834) ran to a million copies. In 1836 he inaugurated cheap journalism in a popular Conservative organ, *La Presse*, the subscription to which was only forty francs a year. This undertaking involved him in a duel with Armand Carrel, the fatal result of which made him refuse satisfaction to his opponents. In 1838 he was excluded from the Chamber of Deputies, to which he had been four times elected, on the plea of his foreign birth, but was admitted in 1842. He resigned early in February 1847, and on the 24th of February 1848 sent a note to Louis Philippe demanding his resignation and the regency of the duchess of Orleans. In the Legislative Assembly he voted with the Mountain. He pressed eagerly in his paper for the election of Prince Louis Napoleon, of whom he afterwards became one of the most violent opponents. In 1856 he sold *La Presse*, only to resume it in 1862, but his work was over and Girardin started a new journal, *La Liberté*, the sale of which was forbidden in the public streets. He supported Émile Ollivier and the Liberal Empire, but plunged into vehement journalism again to advocate war against Prussia. Of his many subsequent enterprises the most successful was the purchase of *Le Petit Journal*, which served to advocate the policy of Thiers, though he himself did not contribute. The crisis of the 16th of May 1877, when Jules Simon fell from power, made him resume his pen to attack MacMahon and the party of reaction in *La France* and in *Le Petit Journal*. Émile de Girardin married in 1831 Delphine Gay (see above), and after her death in 1855 Guillermette Joséphine Brunold, countess von Tiefenbach, widow of Prince Frederick of Nassau. He was divorced from his second wife in 1872.

A list of his social and political writings includes: *De la presse périodique au XIXe siècle* (1837); *De l’instruction publique* (1838); *Études politiques* (1836); *De la liberté de la presse et du journalisme* (1842); *Le Droit au travail au Luxembourg et à l’Assemblée Nationale* (2 vols., 1848); *Les Quinze-deux* (1849, 4 vols.), a series of articles on current parliamentary questions; *La Politique universelle, décrets de l’avenir* (Brussels, 1852); *Le Condamné du 6 mars* (1857), an account of his own differences with the government in 1856, when he was arrested for 20,000 francs for an article *Le Dossier de la guerre* (1872), a collection of official documents; *Questions de mon temps, 1850 à 1865*, articles extracted from the daily and weekly press (12 vols., 1856).

**GIRARDON, FRANÇOIS** (1628–1715), French sculptor, was born at Troyes on the 17th of March 1628. As a boy he had for master a joiner and wood-carver of his native town, named Baudesson, under whom he is said to have worked at the château of Liébault, where he attracted the notice of Chancellors Séguier. By the chancellor’s influence Girardon was first removed to Paris and placed in the studio of François Anguier, and afterwards sent to Rome. In 1652 he was back in France, and seems at once to have addressed himself with something like ignoble subserviency to the task of conchating the court painter Charles Le Brun. Girardon is reported to have declared himself incapable of composing a group, whether with truth or from motives of policy it is impossible to say. This much is certain, that a very large proportion of his work was carried out from designs by Le Brun, and shows the merits and defects of Le Brun’s manner—a great command of ceremonial pomp in presenting his subject, coupled with a large treatment of forms which if it were more expressive might be imposing. The court which Girardon paid to the “premier peintre du roi” was rewarded. An immense quantity of his work was accomplished by his assistants. His recognition of the successful execution of four figures for the Bains d’Apollon, Le Brun induced the king to present his protégé personally with a purse of 300 louis, as a distinguishing mark of royal favour. In 1650 Girardon was made member of the Academy, in 1659 professor, in 1674 “adjoint au recteur,” and finally in 1695 chancellor. Five years before (1690), on the death of Le Brun, he had also been appointed “inspecteur général des ouvrages de sculpture”—a place of power and profit. In 1699 he completed the bronze equestrian statue of Louis XIV., executed by the town of Paris on the Place Louis-le-Grand. This statue was melted down during the Revolution, and is known to us only by a small bronze model (Louvre) finished by Girardon himself. His *Tomb of Richelieu* (church of the Sorbonne) was saved from destruction by Alexandre Lenoir, who received a bayonet thrust in protecting the head of the cardinal from mutilation. It is a capital example of Girardon’s work, and the theatrical pomp of its style is typical of the funeral sculpture of the reigns of Louis XIV. and Louis XV.; but amongst other important specimens yet remaining may also be cited the Tomb of Louvois (St Eustache), that of Bignon, the king’s librarian, executed in 1656 (St Nicolas du Chardonnet), and decorative sculptures in the Galerie d’Apollon and Chambre du roi in the Louvre. Mention should not be omitted of the group signed and dated 1669, “The Rape of Proserpine” at Versailles, which also contains the “Bull of Apollo.” Although chiefly occupied at Paris Girardon never forgot his native Troyes, the museum of which town contains some of his best works, including a statue of Louis XIV. but its vogue was confined to him, and the hôtel de ville is still shown a medalion of Louis XIV., and in the church of St Rémy a bronze crucifix of some importance—all works by his hand. He died in Paris in 1715.

**GIRARD DE ROUSILLON**, an epic figure of the Carolingian cycle of romance. In the genealogy of romance he is a son of Doon de Mayence, and he appears in different and irreconcilable
circumstances in many of the chansons de geste. The legend of Girart de Roussillon is contained in a Vita Girardi de Roussillon (ed. P. Meyer, in Romaniia, 1878), dating from the beginning of the 12th century and written probably by a monk of the abbey of Pothières or of Vezelay, both of which were founded in 866 by Girart; in Girart de Roussillon, a chanson de geste written early in the 12th century in a dialect midway between French and Provencal, and apparently based on an earlier Burgundian poem; in a 14th century romance in alexandrines (ed. T. A. P. Migaud, Paris and Dijon, 1889); and in a prose romance by Jehan Wauquelin in 1447 (ed. L. de Montille, Paris, 1889). The historical Girard, son of Leuthard and Grimilida, was a Burgundian chief who was count of Paris in 837, and embraced the cause of Lothair against Charles the Bald. He fought at Fontenay in 841, and doubtless followed Lothair to Aix. In 855 he became governor of Provence for Lothair’s son Charles, king of Provence (d. 863). His wife Bertha defended Vienne unsuccessfully against Charles the Bald in 870, and Girard, who had perhaps aspired to be the titular ruler of the northern part of Provence, which he had continued to administer under Lothair II. until that prince’s death in 869, retired with his wife to Avignon, where he died probably in 877, certainly before 879. The tradition of his piety, of the heroism of his wife Bertha, and of his wars with Charles passed into romance; but the historical facts are so distorted that in Girard de Roussillon the trouvère makes him the opponent of Charles Martel, to whom he stands in the relation of brother-in-law. He is nowhere described in authentic history of the period. The romance is the story of the transfer of his castle built on Mount Lassos, near Châtillon-sur-Seine. Southern traditions concerning Count Girart, in which he is made son of Garin de Monglane, are embodied in Girart de Viane (13th century) by Bertrand de Bar-sur-l’Aube, and in the Aspramonte of Andrea da Barberino, based on the French chanson d’Aspremont, where he figures as Girart de Frete or de Fratte.2 Girart de Viane is the recital of a siege of Vienne by Charlemagne, and in Aspramonte Girart de Fratte leads an army of infidels against Charlemagne. Girart de Roussillon was long held to be of Provencal origin, and to be a proof of the existence of an independent Provencal epic, but its Burgundian origin may be taken as proved.

GIRDLE. GIOVANNI, Count (1776-1834). Italian by birth, but of French origin, was born at Rome, and showed a precocious passion for the theatre. His first play, L’Onestà non si vince, was successfully produced in 1798. He took part in politics as an active supporter of Pius VI., but was mainly occupied with the production of his active plays, and in 1809 became director-general of the Italian theatres. He died at Naples in 1834. Count Giraud’s comedies, the best of which are Galerie per equivoco (1807) and L’Affolet’ imbarazz (1824), were bright and amusing on the stage, but of no particular literary quality.

His collected comedies were published in 1823 and his Teatro domestico in 1825.

GIRDLE. (O. Eng. gyrdel, from gyrdan, to gird; cf. Ger. Gürtel, Dutch gordel, from gurten and gorden; “gird” and its doublet “girth” together with the other Teutonic cognates have been referred to some by the root ghar—to seize, enclose, seen in Gr. κεφαλ, hand, Lat. hortus, garden, and also English yard, garden, garth, &c.), a band of leather or other material worn round the waist, either to confine loose and flowing clothes or as to allow freedom of movement, or to fasten and support the garments of the wearer. Among the Romans it was used to confine the tunica, and it formed part of the dress of the soldier; when a man quitted military service he was said, 1

1 It is of interest to note that Freta was the old name for the town of Saint Remy, and that it is close to the site of the ancient town of Numaturn, the name of which is possibly preserved in Grab de Monglane, the ancestor of the heroes of the cycle of Guillame d’Orange.

cingulum deponere, to lay aside the girdle. Money being carried in the girdle, zonam perdere signified to lose one’s purse, and, among the Greeks, to cut the girdle was to rob a man of his money.

Girdles and girdle-buckles are not often found in Gallo-Roman graves, but in the graves of Franks and Burgundians they are constantly present, often ornamented with bosses of silver or bronze, chased or inlaid. Sidonius Apollinaris speaks of the Franks as belted round the waist, and Gregory of Tours in the 6th century says a dagger was carried in the Frankish girdle.

In the Anglo-Saxon dress the girdle makes an unimportant figure, and the Norman knights, as a rule, wore their belts under their hauberks. After the Conquest, however, the artificers gave more attention to a piece whose buckle and tongue invited the work of the goldsmith. Girdles of varying richness are seen on most of the western medieval effigies. That of Queen Berengaria lets the long pendant hang below the knee, following a fashion which frequently reappears.

In the latter part of the 13th century the knight’s surcoat is girdled with a narrow cord at the waist, while the great belt, which had become the pride of the well-equipped cavalier, loops across the hips carrying the heavy sword aslant over the thighs or somewhat to the left of the wearer.

But it is in the second half of the following century that the livery belt takes its most splendid form. Under the year 1350 the commemorator of the chronicle of Nangis notes that the increase of jewelled belts had mightily enhanced the price of pearls. The belt is then worn, as a rule, girdling the hips at some distance below the waist, being probably supported by hooks as is the belt of a modern infantry soldier. The end of the belt, after being drawn through the buckle, is knotted or caught up after the fashion of the tag of the Garter. The waist girdle either disappears from sight or as a narrow and ornamented strap is worn diagonally to help in the support of the belt. A mass of beautiful ornament covers the whole belt, commonly so long an unbroken line of bosses enriched with curiously worked roundels or lozenges which, when the loose strap-end is abandoned, meet in a splendid morse or clasp on which the enameller and jeweller had wrought their best. About 1420 this fashion tends to disappear, the loose tabards worn over armour in the jousting-yard hindering its display. The belt never regains its importance as an ornament, and, at the beginning of the 16th century, sword and dagger are sometimes seen hanging at the knight’s sides without visible support.

In civil dress the magnificent belt of the 14th century is worn by a member of rank over the hips of the tight short-skirted coat, and in that century and in the 15th and 16th there are sumptuary laws to check the extravagance of rich girdles worn by men and women whose humble station made them unseemly. Even priests must be rebuked for their silver girdles with baselards hanging from them. Purse, daggers, keys, penners and inkhorns, beads and even books, dangled from girdles in the 15th and early 16th centuries. Afterwards the girdle goes on as a mere strap for holding up the clothing or as a sword-belt. At the Restoration men contrasted the fashion of the court, a light rapier hung round a broad shoulder-belt, with the fashion of the countryside, where a heavy weapon was supported by a narrow waistbelt. Soon afterwards both fashions disappeared. Sword-bucklers were concealed by the skirt, and the belt, save in certain military and sporting costumes, has no more been in sight in England. Even as a support for breeches or trousers, the use of straps has gradually supplanted the girdle during the past century.

In most of those parts of the Continent—Brittany, for example—where the peasantry maintains old fashions in clothing, the belt or girdle is still an important part of the clothing. Italian non-commissioned officers find that the Sicilian recruit’s main objection to the first bath of his life-time lies in the fact that he must lay down the cherished belt which carries his few valuables. With the Circassian the belt still buckles on an arsenal of pistols and knives.
Folklore and ancient custom are much concerned with the girdle. Bankrupts at one time put it off in open court; French law refused courtesans the right to wear it; Saint Guthlac cast out devils by buckling his girdle round a possessed man; an earl is “a belted earl” since the days when the putting on of a girdle was part of the ceremony of his creation; and fairy tales of half the nations deal with girdles which give invisibility to the wearer. (O. B.)

GIRSA, or GIRGEE, a town of Upper Egypt on the W. bank of the Nile, 313 m. S.S.E. of Cairo by rail and about 10 m. N.N.E. of the ruins of Abydos. Pop. (1907) 15,803, of whom about one-third are Copts. The town presents a picturesque appearance from the Nile, which at this point makes a sharp bend. A ruined mosque with a tall minaret stands by the river-brink. Many of the houses are of brick decorated with glazed tiles. The town is noted for the excellence of its pottery. Girga is the seat of a Coptic bishop. It also possesses a Roman Catholic monastery, considered the most ancient in the country. As lately as the middle of the 18th century the town stood a quarter of a mile from the river, but is now on the bank, the intervening space having been washed away, together with a large part of the town, by the stream continually encroaching on its left bank.

GIRGENTI (anc. Agrigentum, q.v.), a town of Sicily, capital of the province which bears its name, and an episcopal see, on the south coast, 58 m. S. by E. of Palermo direct and 843 m. by rail. Population (1901) 25,024. The town is built on the western summit of the ridge which formed the northern portion of the ancient site; the main street runs from E. to W. on the level, but the side streets are steep and narrow. The cathedral occupies the highest point in the town; it was not founded till the 13th century, taking the place of the so-called temple of Concord. The campanile still preserves portions of its original architecture, but the interior has been modernized. In the chapter-house a famous sarcophagus, with scenes illustrating the myth of Hippolytus, is preserved. There are other scattered remains of 13th-century architecture in the town, while, in the centre of the ancient city, close to the so-called oratory of Phalaris, is the Norman church of S. Nicolo. A small museum in the town contains vases, terra-cottas, a few sculptures, &c. The port of Girgenti, 54 m. S.W. by rail, now known as Porto Empedocle (population in 1901, 11,539), as the principal place of shipment for sulphur, the mining district beginning immediately north of Girgenti.

GIRISH, a village and fort of Afghanistan. It stands on the right bank of the Helmund 78 m. W. of Kandahar on the road to Herat; 3641 ft. above the sea. The fort, which is garrisoned from Kandahar and is the residence of the governor of the district (Pusht-i-Rud), has little military value. It commands the fords of the Helmund and the road to Seistan, from which it is about 150 m. distant; and it is the centre of a rich agricultural district. Girishk was occupied by the British during the first Afghan War; and a small garrison of sepoys, under a native officer, successfully withstood a siege of nine months by an overwhelming Afghan force. The Dashti-i-Bakwa stretches beyond Girishk towards Farah, a level plain of considerable width, which tradition assigns as the field of the final conflict between the Scythes and the Parthians. It is watered by the river of the district of the province of Ghor, E. of which is Dordogne and Lot-et-Garonne, S. by that of Landes, and W. by the Bay of Biscay. It takes its name from the river or estuary of the Gironde formed by the union of the Garonne and Dordogne. The department divides itself naturally into a western and an eastern portion. The former, which is termed the Landes (q.v.), occupies more than a third of the department, and consists chiefly of morass or sandy plain, thickly planted with pines and divided from the sea by a long line of dunes. These dunes are planted with pines and other trees, so binding the sand together with their roots, prevent it from drifting inland and afford a barrier against the sea. On the east the dunes are fringed for some distance by two extensive lakes, Carcans and Lacaunay, communicating with each other and with the Bay of Arcachon, near the southern extremity of the department. The Bay of Arcachon contains numerous islands, and on the land side forms a vast shallow lagoon, a considerable portion of which, however, has been drained and converted into arable land. The eastern portion of the department consists chiefly of a succession of hill and dale, and, especially in the valley of the Gironde, is very fertile. The estuary of the Gironde is about 45 m. in length, and varies in breadth from 2 to 6 m. It presents a succession of islands and mud banks which divide it into two channels and render navigation somewhat difficult. It is, however, well
buoyed and lighted, and has a mean depth of 21 ft. There are extensive marshes on the right bank of the north of Bordeaux, and the shores on the left are characterized, especially towards the mouth, by low-lying polders protected by dikes and composed of fertile salt marshes. At the mouth of the Gironde stands the famous tower of Cordouan, one of the finest lighthouses of the French coast. It was built between the years 1585 and 1617 by the architect and engineer Louis de Foix, and added to towards the end of the 18th century. The principal affluent of the Dordogne in this department is the Isle. The feeders of the Gironde are, with the exception of the Dropt, all small. West of the Gironne is the only river of importance in the Arcachon, which flows into the Bay of Arcachon. The climate is humid and mild and very hot in summer. Wheat, rye, maize, oats and tobacco are grown to a considerable extent. The corn produced, however, does not meet the wants of the inhabitants. The culture of the vine is by far the most important branch of industry carried on (see WR), the vineyards occupying about one-seventh of the surface of the department. The wine-growing districts are the Médoc, Graves, Côtes, Palus, Entre-deux-Mers and Sauternes. The Médoc is a region of 50 m. in length by about 6 m. in breadth, bordering the left banks of the Garonne and the Gironde between Bordeaux and the sea. The Graves country forms a zone 30 m. in extent, stretching along the left bank of the Garonne from the neighbourhood of Bordeaux to Barsac. The Sauternes country lies to the S.E. of the Graves. The Côtes lie on the right bank of the Dordogne and Gironde, between it and the Garonne, and on the left bank of the Garonne. The produce of the Garonne, the alluvial land of the valleys, and of the Entre-deux-Mers, situated on the left bank of the Dordogne, is inferior. Fruits and vegetables are extensively cultivated, the peaches and pears being especially fine. Cattle are extensively raised, the Basadals breed of oxen and the Bordelais breed of milch-cows being well known. Oyster-breeding is carried on on a large scale in the Bay of Arcachon. Large supplies of resin, pitch and turpentine are obtained from the pine woods, which also supply vine-props, and there are well-known quarries of limestone. The manufactures are various, and, with the general trade, are chiefly carried on at Bordeaux (q.v.), the chief town and third port in France. Pauillac, Blaye, Libourne and Arcachon are minor ports. Gironde is divided into the arrondissements of Bordeaux, Blaye, Lesparre, Libourne, Bazas and La Réole, with 49 cantons and 554 communes. The department is served by five railways, the chief of which are those of the Orleanais and Southern companies. It forms part of the circumscription of the archbishopric, the appeal-court and the académie (educational division) of Bordeaux, and of the region of the XVIII. army corps, the headquarters of which are at that city. Besides Bordeaux, Libourne, La Réole, Bazas, Blaye, Arcachon, St. Emilion, and St. Marie-in-Grande are the most noteworthy towns and receive separate treatment. Among the other places of interest the chief are Cadillac, on the right bank of the Garonne, where there is a castle of the 16th century, surrounded by fortifications of the 14th century; Lahêde, with a feudal château in which Montesquieu was born and lived; Villandraut, where there is a ruined castle of the 13th century; Uzezte, which has a church begun in 1310 by Pope Clement V.; Mazères with an imposing castle of the 14th century; La Sauve, which has a church (11th and 12th centuries) and other remains of a Benedictine abbey; and Ste Foy-la-Grande, a bastide created in 1255 and afterwards a centre of Protestantism, which is still strong there. La Teste (pop. in 1906, 6509) was the capital in the middle ages of the famous lords of Buch.

GIRONDISTS (Fr. Girondins), the name given to a political party in the Legislative Assembly and National Convention during the French Revolution (1791-1793). The Girondists were, indeed, rather a group of individuals holding certain opinions and principles in order to import into an organized political party, and the name was at first somewhat loosely applied to them owing to the fact that the most brilliant exponents of their point of view were deputies from the Gironde. These deputies were twelve in number, six of whom—the lawyers Vergniaud, Guadet, Gensonné, Grangeneuve and Jay, and the tradesman Jean François Ducos—sat both in the Legislative Assembly and the National Convention. In the Legislative Assembly these represented a compact body of opinion which, though not as yet definitely republican, was considerably more advanced than the moderate royalism of the majority of the Parisian deputies. Associated with these views was a group of deputies from other parts of France, of whom the most notable were Condorcet, Fauchet, Lasource, Isnard, Kersaint, Henri Lariviére, and, above all, Jacques Pierre Brissot, Roland and Pétion, elected mayor of Paris in succession to Bailly on the 16th of November 1790. On the spirit and policy of the Girondists Madame Roland, whose salon became their gathering-place, exercised a powerful influence (see ROLAND); but such party cohesion as they possessed they owed to the energy of Brissot (q.v.), who came to be regarded as their mouthpiece in the Assembly and the Jacobin Club. Hence the name Brissotins, coined by Camille Desmoulins, which was sometimes substituted for that of Girondins, sometimes closely coupled with it. As strictly party designations these first came into use after the assembling of the National Convention (September 20th, 1792), to which a large proportion of the deputies from the Gironde who had sat in the Legislative Assembly were returned. Both were used as terms of opprobrium by the orators of the Jacobin Club, who freely denounced "the Royalists, the Federalists, the Brissotins, the Girondins and all the enemies of the democracy" (F. Aulard, Soc. des Jacobins, vi. 531).

In the Legislative Assembly the Girondists represented the principle of democratic revolution within and of patriotic defiance to the European powers without. They were all-powerful in the Jacobin Club (see JACOBINS), where Brissot's influence had not yet been ousted by Robespierre, and they did not hesitate to use this advantage to stir up popular passion and intimidate those who sought to stay the progress of the Revolution. They compelled the king in 1792 to choose a ministry composed of their partisans—among them Roland, Dumouriez, Claviere and Servan; and it was they who forced the declaration of war against Austria. In all this there was no apparent line of cleavage between La Gironde and the Mountain. Montagnards and Girondists alike were fundamentally opposed to the monarchy; both were democrats as well as republicans; both were prepared to appeal to force in order to realize their ideals; in spite of the accusation of "federalism" freely brought against them, the Girondists desired as little as the Montagnards to break up the unity of France. Yet from the first the leaders of the two parties stood in avowed opposition, in the Jacobin Club as in the Assembly. It was largely a question of temperament. The Girondists were idealists, doctrinaires and theorists rather than men of action; they encouraged, it is true, the "armed petitions" which resulted in their disbanding, in the emeute of the 26th of June; but Roland, turning the ministry of the interior into a publishing office for tracts on the civic virtues, while in the provinces riotous mobs were burning the châteaux unchecked, is more typical of their spirit. With the ferocious fanaticism or the ruthless opportunism of the future organizers of the Terror they had nothing in common. As the Revolution developed they trembled at the anarchic forces they had helped to unchain, and tried in vain to curb them. The overthrow of the monarchy on the 10th of August and the massacres of September were not their work, though they claimed credit for the results achieved.

The crisis of their fate was not slow in coming. It was they who proposed the suspension of the king and the summoning of the National Convention; but they had only consented to overthrow the kinglyship when they found that Louis XVI. was impervious to their counsels, and, the republic once established, they were anxious to arrest the revolutionary movement which they had helped to set in motion. As Daunou shrewdly observes in his Mémoires, they were too cultivated and too polished to retain their popularity long in times of disturbance, and were therefore the more inclined to work for the establishment of order, which would mean the guarantee of their own
Thus the Girondists, who had been the Radicals of the Legislative Assembly, became the Conservatives of the Convention. But they were soon to have practical experience of the fate that overtook those who attempt to arrest in mid-career a revolution they themselves have set in motion. The ignorant populace, for whom the promised social millennium had by no means dawned, saw in an attitude seemingly so inconsistent obvious proof of corrupt motives, and there were plenty of prophets of misrule to encourage the delusion—orators of the clubs and the street corners, for whom the restoration of order would have meant well-deserved obscurity. Moreover, the Sepulchres (Robespierre, Danton, Marat and their lesser satellites)—realized that not only their influence but their safety depended on keeping the Revolution alive. Robespierre, who hated the Girondists, whose lustre had so long obscured his own, had proposed to include them in the proscription lists of September; the Mountain to a man desired their overthrow.

The crisis came in March 1793. The Girondists, who had a majority in the Convention, controlled the executive council and filled the ministry, believed themselves invincible. Their orators had no serious rivals in the hostile camp; their system was established in the purest reason. But the Montagnards made up by their fanatical, or desperate, energy and boldness for what they lacked in talent or in numbers. They had behind them the revolutionary Commune, the Sections and the National Guard of Paris, and they had gained control of the Jacobin club, where Brissot, absorbed in departmental work, had been superseded by Robespierre. And as the motive power of this formidable mechanism of force they could rely on the native suspiciousness of the Parisian populace, exaggerated now into madness by famine and the menace of foreign invasion. The Girondists played into their hands. At the trial of Louis XVI. the bulk of them had voted for the "appeal to the people," and so laid themselves open to the charge of "royalism"; they denounced the domination of Paris and summoned provincial levies to their aid, and so fell under suspicion of "feudalism," though they rejected Buzot's proposal to transfer the Convention to Versailles. They strengthened the revolutionary Commune by decreeing its abolition, and then withdrawing the decree at the first sign of popular opposition; they increased the prestige of Marat by prosecuting him before the Revolutionary Tribunal, where his acquittal was a foregone conclusion. In the suspicious temper of the times this vacillating policy was doubly fatal. Marat never ceased his denunciations of the "faction des hommes d'État," by which France was being betrayed to her ruin, and his parrot cry of "Nous sommes trahis!" was re-echoed from group to group in the streets of Paris. The Girondists, for all their fine phrases, were sold to the enemy, as Lafayet, Dumouriez and a hundred others—once popular favourites—had been sold.

The hostility of Paris to the Girondists received a fateful advertisement by the election, on the 15th of February 1793, of the ex-Girondist Jean Nicolas Pache (1746-1823) to the mayoralty. Pache had twice been minister of war in the Girondist government; but his incompetence had led him open to strong criticism, and on the 4th of February he had been superseded by a vote of the Convention. This was enough to secure him the suffrages of the Paris electors ten days later, and the Mountain was strengthened by the accession of an ally whose one idea was to use his new power to revenge himself on his former colleagues. Pache, with Chaumette, procureur of the Commune, and Hébert, deputy procureur, controlled the armed organization of the Paris Sections, and prepared to turn this against the Convention. The abortive émeute of the 10th of March warned the Girondists of their danger, but the Commission of Twelve appointed on the 18th of May, the arrest of Marat and Hébert, and other precautionary measures, were defeated by the popular risings of the 27th and 31st of May, and, finally, on the 2nd of June, Hanriot with the National Guards purged the Convention of the Girondists. Ismard's threat, uttered on the 25th of May, to march France upon Paris had been met by Paris marching upon the Convention.

The list drawn up by Hanriot, and endorsed by a decree of the intimidated Convention, included twenty-two Girondist deputies and ten members of the Commission of Twelve, who were ordered to be detained at their lodgings "under the safeguard of the people." Some submitted, among them Genonné, Guadet, Vergniaud, Pétion, Birot and Boyer-Fonfrède. Others, including Brissot, Louvet, Buozot, Lasource, Grangeneuve, Lazarièr and Bergeot, escaped from Paris and, joined later by Girond, Pétion and Birot, set to work to organize a movement of the provinces against the capital. This attempt to stir up civil war determined the wavering and frightened Convention. On the 13th of June it voted that the city of Paris had deserved well of the country, and ordered the imprisonment of the detained deputies, the filling up of their places in the Assembly by their suppliants, and the initiation of vigorous measures against the movement in the provinces. The excuse for the Terror that followed was the imminent peril of France, menaced on the east by the advance of the armies of the Coalition, on the west by the Royalist insurrection of La Vendée, and the need for preventing at all costs the outbreak of another civil war. The assassination of Marat by Charlotte Corday (q.v.) only served to increase the unpopularity of the Girondists and to seal their fate. On the 28th of July a decree of the Convention proscribed, as traitors and enemies of their country, twenty-one deputies, the final list of those sent for trial comprising the names of Antiboul, Boulanger the younger, Boyer-Fonfrède, Brissot, Carra, Duchastel, the younger Ducas, Dufréch de Valazé, Duprat, Fauchet, Gardien, Genonné, Lacaze, Lasource, Lauze-Deperret, Lehardi, Lestert-Barbu-aus, the elder Miiville, Sillery, Vergniaud and Viger, of whom five were deputies from the Gironde. The names of thirty-nine others were included in the final acte d'accusation, accepted by the Convention on the 24th of October, which stated the crimes for which they were to be tried as their perfidious ambition, their hatred of Paris, their "feudalism" and, above all, their responsibility for the attempt of their escaped colleagues to provoke civil war. The trial of the twenty-one, which began before the Revolutionary Tribunal on the 24th of October, was a mere farce, the verdict a foregone conclusion. On the 31st they were borne to the guillotine in five tumbrils, the corpse of Dufréch de Valazé—who had killed himself—being carried with them. They met death with great courage, singing the refrain "Plût à la mort que l'esclavage!" Of those who escaped to the provinces the greater number, after wandering about singly or in groups, were either captured and executed or committed suicide, among them Barbaroux, Buozot, Condrozet, Grangeneuve, Guadet, Keraint, Pétion, Rabaut de Saint-Étienne and Rebecqui. Roland had killed himself at Rouen on the 15th of November, a week after the execution of his wife. Among the very few who finally escaped was Jean Baptiste Louvet, whose Mémoires give a thrilling picture of the sufferings of the fugitives. Incidentally they prove, too, that the sentiment of France was for the time against the Girondists, who were proscribed even in their chief centre, the city of Bordeaux. The survivors of the party made an effort to re-enter the Convention after the fall of Robespierre, but it was not until the 3rd of March 1795 that they were formally reinstated. On the 3rd of October of the same year (11 Vendémiaire, year III.) a solemn fête in honour of the Girondist "martyrs of liberty" was celebrated in the Convention. GIRVIN, a police burgh, market and fishing town of Ayrshire, Scotland, at the mouth of the Girvan, 21 m. S.W. of Ayr, and 63 m. S.W. of Glasgow by the Glasgow & South-Western railway. Pop. (1901) 4024. The principal industry was weaving, but the substitution of the power-loom for the hand-loom nearly put an end to it. The herring fishery has developed to considerable proportions, the harbour having been enlarged and protected by piers and a breakwater. Moreover, the town has grown in reputa as a health and holiday resort, its situation being one of the finest in the west of Scotland. There is excellent sea-bathing, and a good golf-course. The vale of Girvan, one of the most fertile tracts in the shire, is made so by the Water of Girvan, which rises in the loch of Girvan Eye, pursues a very tortuous course of 36 m. and empties into the sea. Girvan is the point of communication with Ailsa Craig. About 13 m. S.W. at the mouth of the Stinchar is the fishing village of Ballantrae (pop. 511).

GIRVIN, ARTHUR (1848-1899), French historian, was born at Trévoux (Ain) on the 20th of February 1848. After rapidly completing his classical studies at the lycée at Chartres, he spent some time in the administrative service and in journalism. He then entered the École des Chartes, where, under the influence of J. Quicherat, he developed a strong inclination to the study of the middle ages. The lectures at the École des Hautes Études, which he attended from its foundation in 1868, revealed his true bent; and henceforth he devoted himself almost entirely to scholarship. He began modestly by the study of the municipal charters of St Omer. Having been appointed assistant lecturer and afterwards full lecturer at the École des Hautes Études, it was to the town of St Omer that he devoted his first lectures and his first important work, Histoire de la ville de Saint-Omer et de ses institutions jusqu'au XIVe siècle (1877). He, however, soon realized that the charters of one town can only be understood by comparing them with those of other towns, and he was gradually led to continue the work which Augustin Thierry had broadly outlined in his studies on the Tiers État. A minute knowledge of printed books and a medicoal examination of departmental and communal archives furnished him with material for a long course of successful lectures, which gave rise to some important works on municipal history and led to a great revival of interest in the origins and significance of the urban communities in France. Girvin himself published Les Établissements de Rosen (1883-1885), a study, based on very minute researches, of the charter granted to the capital of Normandy by Henry II., King of England, and of the diffusion of similar charters throughout the French dominions of the Plantagenets; a collection of Documents sur les relations de

la royauté avec les villes de France de 1180 à 1314 (1885); and Etude sur les origines de la commune de Saint-Quentin (1887).

About this time personal considerations induced Girvin to devote the greater part of his energy to the study of diplomacy which had been much neglected at the École des Chartes, but had made great strides in Germany. As assistant (1885) and successor (1888) to Louis de Més Latrie, Girvin restored the study of diplomatic, which had been founded in France by Dom Jean Mabilon, to its legitimate importance. In 1894 he published his Manuel de diplomatique, a monument of lucid and well-arranged erudition, which contained the fruits of his long experience of archives, original documents and textual criticism; and his pupils, especially those at the École des Hautes Études, with the help of his entire literary output, took the preparation of an inventory and, subsequently, of a critical edition of the Carolingian diplomacies. By arrangement with E. Mühlbacher and the editors of the Monumentum Germaniae historica, this part of the work was reserved for Girvin. Simultaneously with this work he completed the publication of the annals of the Carolingian epoch on the model of the German Jahrbiacher, reserving for himself the reigns of Charles the Bald. Of this series his pupils produced in his lifetime Les Derniers Girondins (by E. Etudes, of which he was the editor), and Charles III. of France (by E. Favre, 1893), and Charles le Simple (by Eckel, 1899). The biographies of Louis IV. and Hugh Capet and the history of the kingdom of Provence were not published until after his death, and his own unfinished history of Charles the Bald was left to be completed by his pupils. The preliminary work on the Carolingian diplomas involved such lengthy and costly researches that the Académie des Inscriptions et Belles-Lettres took over the expenses after Girvin's death.

In the midst of these multifarious labours Girvin found time for extensive archaeological researches, and made a special study of the medieval treatises dealing with the technical processes employed in the arts and industries. He prepared a new edition of the monk Theophilus's celebrated treatise, Diversarum artium schedula, and for several years devoted his Saturday mornings to laboratory research with the chemist Aimé Girard at the Conservatoire des Arts et Métiers, the results of which were utilized by Marcellin Berthelot in the first volume (1894) of his Chimie au moyen âge. Girvin took an energetic part in the Collection des textes relatifs à l'histoire du moyen âge, which was done in great measure to his initiative. He was appointed director of the section of French history in La Grande Encyclopédie, and contributed more than a hundred articles, many of which, e.g. "Archives" and "Diplomatique," were original works. In collaboration with his pupil André Réville, he wrote the chapters on "L'Emancipation des villes, les communes et les bourgeoisies" and "Le Commerce et l'industrie au moyen âge" for the Histoire générale de Lavisse and Rambaud. Girvin took a keen interest in politics, joining the republican party and writing numerous articles in the republican newspapers, mainly on historical subjects. He was intensely interested in the Dreyfus case, but his robust constitution was undermined by the anxieties and disappointments occasioned by the Zola trial and the Rennes court-martial, and he died in Paris on the 13th of November 1899.

For details of Girvin's life and works see the funeral orations published in the Bibliographie de l'École des Chartes, and afterwards in a pamphlet (1899). See also the biography by Ferdinand Lot in the Annaire de l'École des Hautes Études for 1901; and the bibliography of his works by Henry Maistre in the Correspondance historique et archéologique (1899 and 1900).

GIBSON, a seaport in New Zealand, in Cook county, provincial district of Auckland, on Poverty Bay of the east coast of North Island. Pop. (1901) 2733; (1906) 5664. Wool, frozen mutton and agricultural produce are exported from the rich district surrounding. Petroleum has been discovered in the neighbourhood, and about 40 m. from the town there are warm medicinal springs. Near the site of Gisborne Captain Cook landed in 1769, and gave Poverty Bay its name from his inability to obtain supplies owing to the hostility of the natives. Young Nick's Head, the southern horn of the bay, was named from Nicholas Young, his ship's boy, who first observed it.
GISLEBERT—GIULIO ROMANO

GISLEBERT (or GILBERT) OF MONS (c. 1150–1225), Flemish chronicler, became a clerk, and obtained positions of provost of the churches of St Germanus at Mons and St Alban at Namur, in addition to several other ecclesiastical appointments. In official documents he is described as chaplain, chancellor or notary, of Baldwin V., count of Hainaut (d. 1193), who employed him on important business. After 1200 Gislebert wrote the Chronicon Hanoniense, a history of Hainaut and the neighbouring lands from about 1050 to 1195, which is especially valuable for the latter part of the 12th century, and for the life and times of Baldwin V.

The chronicle is published in Band xxi. of the Monumenta Germaniae historica (Hanover, 1826 fols; and separately with introduction by W. Arndt (Hanover, 1890). Another edition has been published by L. Vanderkindere in the Recueil des textes pour servir à l'étude de l'histoire de Belgique (Brussels, 1900); and there is a French translation by G. Menilglaise (Touraine, 1794).

See W. Meyer, Das Werk des Kandlers Gislebert von Mons als verfassungsgeschichtliche Quelle (Königsberg, 1888); K. Huygenso, Sur la valeur historique de la chronique Gislebert de Mons (Genève, 1889); and W. Wattenbach, Deutschlands Geschichtsquellen, Band ii. (Berlin, 1894).

GISORS, a town of France, in the department of Eure, situated in the pleasant valley of the Epte, 44 m. N.W. of Paris on the railway to Dieppe. Pop. (1906) 4,454. Gisors is dominated by a feudal stronghold built chiefly of rough stones of English origin in the 11th and 12th centuries. The outer enceinte, to which is attached a cylindrical donjon erected by Philip Augustus, king of France, embraces an area of over 7 acres. On a mound in the centre of this space rises an older donjon, octagonal in shape, protected by another enceinte. The outer ramparts and the ground they enclose have been converted into promenades. The church of St Gervais dates in its oldest parts—the central tower, the choir and parts of the aisles—from the middle of the 13th century, when it was founded by Blanche of Castile. The rest of the church belongs to the Renaissance period. The Gothic and Renaissance styles mingle in the west façade, which, like the interior of the building, is adorned with a profusion of sculptures; the fine carving on the wooden doors of the north and west portals is particularly noticeable. The less interesting buildings of the town include a wooden house of the Renaissance era, an old convent now used as an hôtel de ville, and a handsome modern hospital. There is a statue of General de Blamont, born at Gisors in 1770. Among the industries of Gisors are felt manufacture, bleaching, dyeing and leather-dressing.

In the middle ages Gisors was capital of the Vexin. Its position on the frontier of Normandy caused its possession to be hotly contested by the kings of England and France during the 12th century, at the end of which it and the dependent fortresses of Neufles and Dangu were ceded by Richard Cour de Lion to Philip Augustus. During the wars of religion of the 16th century it was occupied by the duke of Mayenne on behalf of the League, and in the 17th century, during the Fronde, by the duchy of Longueville. Gisors was given to Charles Auguste Fouquet in 1718 in exchange for Belle-Isle-en-Mer and made a duchy in 1742. It afterwards came into the possession of the count of Eu and the duchy of Penthièvre.

GISING, GEORGE ROBERT (1857–1903), English novelist, was born at Wakefield on the 22nd of November 1857. He was educated at the Quaker boarding-school of Alderley Edge and at Owens College, Manchester. His life, especially its earlier period, was spent in great poverty, mainly in London, though he was for a time also in the United States, supporting himself chiefly by private teaching. He published his first novel, Workers in the Dawn, in 1880. The Unclassed (1884) and Isabel Clarendon (1886) followed. Demos (1886), a novel dealing with socialist ideas, was, however, the first to attract attention. It was followed by a series of novels remarkable for their pictures of lower middle class life. Gissing's own experiences had preoccupied him with poverty and its brutalising effects on character. He made no attempt at popular writing, and for a long time the sincerity of his work was appreciated only by a limited public. Among his more characteristic novels were: Thyrse (1887), A Life's Morning (1889), The New World (1889), New Grub Street (1891), Born in Exile (1892), The Odd Women (1893), In the Year of Jubilee (1894), The Whirlpool (1897). Others, e.g. The Town Traveler (1901), indicate a humorous faculty, but the prevailing note of his novels is that of a struggling life of the shabby-genteel and lower classes and the conflict between education and circumstances. The quasi-autobiographical Private Papers of Henry Ryecroft (1903) reflects throughout Gissing's studious and retiring tastes. He was a good classical scholar and had a minute acquaintance with the late Latin historians, and with Italian antiquities; and his posthumous Verandil (1904), a historical romance of Italy in the time of Theodoric the Goth, was the outcome of his favourite hobby. Gissing's powers as a literary critic are shown in his admirable study on Charles Dickens (1898). It was here that the emperor Francis I. of Austria signed the treaty of 1813 by which he threw in his lot with the Allies against Napoleon. Wallenstein was interred at the neighbouring Carthusian monastery, but in 1659 the head and right hand were taken by General Baner to Sweden, and in 1702 the other remains were removed by Count Vincent of Waldstein to his hereditary burying ground at Münchwentzitz. Gsichen was originally the village of Zelliněves and received its present name when it was granted to the dignity of a town by Wenceslaus II. in 1352. The place belonged to various noble Bohemian families, and in the 17th century came into the hands of Wallenstein, who made it the capital of the duchy of Friedland and did much to improve and extend it. His murder, and the miseries of the Thirty Years' War, brought it very low; and it passed through several hands before it was bought by Prince Trauttmansdorff, to whose family it still belongs. On the 29th of June 1866 the Prussians gained here a great victory over the Austrians. This victory made possible the junction of the first and second Austrian army corps, and had as an ultimate result the Austrian defeat at Königgrätz.

GIUDICI, PAOLO EMILIANO (1812–1872), Italian writer, was born in Sicily. His History of Italian Literature (1844) brought him to the front, and in 1848 he became professor of Italian literature at Pisa, but after a few months was deprived of the chair on account of his liberal views in politics. On the re-establishment of the Italian kingdom he became professor of aesthetics (resigning 1862) and secretary of the Academy of Fine Arts at Florence, and in 1867 was elected to the chamber of deputies. He held a prominent place as an historian, his works including a Storia del teatro (1860), and Storia dei comuni italiani (1861), besides a translation of Macaulay's History of England (1856). He died at Tonbridge in England, on the 8th of September 1872. A Life appeared at Florence in 1874.

GIULIO ROMANO, or GIULIO PIPPI (c. 1492–1546), the head of the Roman school of painting in succession to Raphael. This prolific painter, modeller, architect and engineer receives his common appellation from the place of his birth—Rome, in the Macello de' Corbi. His name in full was Giulio di Pietro de' Filippo de' Giannuzzi—Giannuzzi being the true family name, and Pippi (which has practically superseded Giannuzzi) being an abbreviation from the name of his grandfather Filippo. The date of Giulio's birth is a little uncertain. Vasari (who knew him personally) speaks of him as fifty-four years old at the date of his death, 1st November 1546; thus he would have been born in 1492. Other accounts assign 1498 as the date of birth. This would make Giulio young indeed in the early and in such case most precarious stages of his artistic career, and
GIULIO ROMANO

would show him as dying, after an infinity of hard work, at the comparatively early age of forty-eight.

Raphael must at all events have been quite youthful when he first arrived in Rome; and at Raphael's death in 1520 he was at the utmost twenty-eight years of age. Raphael had loved him as a son, and had employed him in some leading works, especially in the Loggie of the Vatican; the series there popularly termed "Raphael's Bible" is done in large measure by Giulio,—as for instance the subjects of the "Creation of Adam and Eve," "Noah's Ark," and "Moses in the Bulrushes." In the saloon of the "Incendio del Borgo," also, the figures of "Benefactors of the Church" (Charlemagne, &c.) are Giulio's handswork. It would appear to be curious, objects of this kind Raphael simply furnished the design, and committed the execution of it to some assistant, such as Giulio,—taking heed, however, to bring it up, by final retouching, to his own standard of style and type. Giulio at a later date followed out exactly the same plan; so that in both instances inferiorities of method, in the general blocking-out and even in the details of the work, are not to be precisely charged upon the caposcela. Amid the multitude of Raphael's pupils, Giulio was eminent in pursuing his style, and showed universal aptitude; he did, among other things, a large amount of pictorial planning for his chief. Raphael bequeathed to Giulio, and to his fellow-pupil Gianfrancesco Penni ("II Fattore"), his implements and works of art; and upon them it devolved to bring to completion the vast fresco-work of the "Hall of Constantine" in the Vatican—consisting, along with much minor matter, of the four large subjects, the "Battle of Constantine," the "Apparition of the Cross," the "Baptism of Constantine" and the "Donation of Rome to the Pope." The two former compositions were executed by Pippi, the two latter by Penni. The whole of this enormous undertaking was completed within a period of only three years,—which is the more remarkable as, during some part of the interval since Raphael's decease, the Fleming, Adrian VI., had been pope, and his anti-aesthetic pontificate had left art and artists almost in a state of inanition. Clemens VII. had now, however, succeeded to the popedom. By this time Giulio was regarded as the first painter in Rome; but his Roman career was fated to have no further sequel.

Towards the end of 1524 his friend the celebrated writer Baldassar Castiglione seconded with success the urgent request of the duke of Mantua, Federigo Gonzaga, that Giulio should migrate to that city, and enter the duke's service for the purpose of carrying out his projects in architecture and pictorial decoration. These projects were already considerable, and under Giulio's management they became far more extensive still. The duke treated his painter munificently as to house, table, horses and whatever was in request; and soon a very cordial attachment sprang up between them. In Pippi's multifarious work in Mantua three principal undertakings should be noted. (1) In the Castello he painted the "History of Troy," along with other subjects. (2) In the suburban ducal residence named the Palazzo del Te (this designation being apparently derived from the form of the roads which led towards the edifice) he rapidly carried out a rebuilding on a vastly enlarged scale,—the materials being brick and terra-cotta, as there is no local stone,—and decorated the rooms with his most celebrated works in oil and fresco painting—the story of Psyche, Icarus, the fall of the Titans, and the portraits of the ducal horses and hounds. The foreground figures of Titans are from 12 to 14 ft. high; the room, even in its structural details, is made to subserve the general artistic purpose, and many of its architectural features are distorted accordingly. Greatly admired though these pre-eminent works have always been, and at most times even more than can now be fully ratified, they have suffered severely at the hands of restorers, and modern eyes see them only through a dull and deadening fog of renovation. The whole of the work on the Palazzo del Te, which is of the Doric order of architecture, occupied about five years. (3) Pippi recast and almost rebuilt the cathedral of Mantua; erected his own mansion, replete with numerous antiques and other articles of vertu; reconstructed the street architecture to a very large extent, and made the city, sapped as it is by the shallow of the Minco, comparatively healthy; and at Marmirato, some 3 m. distant from Mantua, he worked out other important buildings and paintings. He was in fact, for nearly a quarter of a century, a sort of Demiurgus of the arts of design in the Mantuan territory.

Giulio's activity was interrupted but not terminated by the death of Duke Federigo. The duke's brother, a cardinal who became regent, retained him in full employment. For a while he went to Bologna, and constructed the façade of the church of S. Petronio in that city. He was afterwards invited to succeed Antonio Sangallo as architect of St. Peter's in Rome,—a splendid appointment, which, notwithstanding the tremendous opposition of his wife and of the cardinal regent, he had almost resolved to accept, when a fever overtook him, and, acting upon a constitution somewhat enfeebled by worry and labour, caused his death on the 1st of November 1546. He was buried in the church of S. Barnaba in Mantua. At the time of his death Giulio enjoyed an annual income of more than 1000 ducats, accruing from the liberalities of his patrons. He left a widow, and a son and daughter. The son, named Raphaelo, studied painting, but died before he could produce any work of importance; the daughter, Virginia, married Ercole Malatesta.

Wide and solid knowledge of design, combined with a promptitude of composition that was never at fault, formed the chief motive power and merit of Giulio Romano's art. Whatever was wanted, he produced it at once, throwing off, as Vasari says, a large design in an hour; and he may in that sense, though not equally so when an imaginative or ideal test is applied, be called a great inventor. It would be difficult to name any other artist who, working as an architect, and as the plastic and pictorial embellisher of his architecture, produced a total of work so fully and homogeneously his own; hence he has been named "the prince of decorators." He had great knowledge of the human frame, and represented it with force and truth, though sometimes with an excess of movement; he was also learned in other matters, especially in medals, and in the plans of ancient buildings. In design he was more strong and emphatic than graceful, and worked a great deal from his accumulated stores of knowledge, without consulting nature direct. As a general rule, his designs are finer and freer than his paintings, whether in fresco or in oil—his easel pictures being comparatively few, and some of them the remnant of deceased master's colouring is marked by an excess of blackish and heavy tints.

Giulio Romano introduced the style of Raphael into Mantua, and established there a considerable school of art, which surpassed in development that of his predecessor Mantegna, and almost rivalled that of Rome. Very many engravings—more than three hundred are mentioned—were made contemporaneously from his works; and this not only in Italy, but in France and Flanders as well. His plan of entrusting principally to assistants the pictorial execution of his cartoons has already been referred to; Primiticcio was one of the leading coadjutors. Rinaldo Mantovano, a man of great ability who died young, was the chief executant of the "Fall of the Giants"; he also co-operated with Benedetto Pagni da Pescia in painting the remarkable series of horses and hounds, and the story of Psyche. Another pupil was Fermo Giuisini, who remained settled in Mantua. The oil pictures of Giulio Romano are not generally of high importance; two leading ones are the "Martyrdom of Stephen," in the church of that saint in Genoa, and a "Holy Family," in the Dresden Gallery. Among his architectural works not already mentioned is the Villa Marmirato, in Rome, with a fresco of Polyphemus, and boys and satyrs; the Ionic façade of this building may have been sketched out by Raphael.

Vasari gives a pleasing impression of the character of Giulio. He was very loving to his friends, genial, affable, well-bred, temperate in the pleasures of the table, but liking fine apparel and a handsome scale of living. He was good-looking, of middle height, with black curly hair and dark eyes, and an ample beard; his portrait, painted by himself, is in the Louvre.
GIUNTA PISANO–GIUSTINIANI

Besides Vasari, Lanzi and other historians of art, the following works by C. D. Bode C. G. von Mull, Notice sur les estampes gravées après dessins de Jules Romain (1865); R. Sandlow, two works on Etchings and Paintings (1800, 1836). (W. M. R.)

GIUNTA PISANO, the earliest Italian painter whose name is found inscribed on an extant work. He is said to have exercised his art from 1202 to 1236. He may perhaps have been born towards 1180 in Pisa, and died in or soon after 1236; but other accounts give 1202 as the date of his birth, and 1238 or thereabouts for his death. There is some ground for thinking that his family name was Capiteno. The inscribed work above referred to, one of his earliest, is a "Crucifix," long in the kitchen of the convent of St Anne in Pisa. Other Pisian works of like date are very barbarous, and some of them may be also from the hand of Giunta. It is said that he painted in the upper church of Assisi,—in especial a "Crucifixion" dated 1236, with a figure of Father Elias, the general of the Franciscans, embracing the foot of the cross. In the sacristy is a portrait of St Francis, also ascribed to Giunta; but it more probably belongs to the close of the 13th century. He was in the practice of painting upon cloth stretched on wood, and prepared with plaster.

GIUGEVO (Giurevo), the capital of the department of Vlachia, Rumania; situated amid mud-flats and marshes on the left bank of the Danube. Pop. (1900) 13,077. Three small islands face the town, and a larger one shelters its port, Smarda, 24 m. E. The rich corn-lands on the north are traversed by a railway to Bucharest, the first line opened in Rumania, which was built in 1869 and afterwards extended to Smarda. Steamers ply to Rustchuk, 23 m. S.W. on the Bulgarian shore, linking the Rumanian railway system to the chief Bulgarian line north of the Balkans (Rustchuk-Varna). Thus Giugevo, besides having a considerable trade with the home ports lower down the Danube, is the headquarters of commerce between Bulgaria and Rumania. It exports timber, grain, salt and petroleum; importing coal, iron and textiles. There are also large saw-mills.

Giugevo occupies the site of Theodorapolis, a city built by the Roman emperor Justinian (A.D. 483-565). It was founded in the 14th century by Genoese merchant adventurers, who established a bank, and a trade in silks and velvets. They called the town, after the patron saint of Genoa, San Giorgio (St George); and hence comes its present name. As a fortified town, Giugevo figured often in the wars for the conquest of the lower Danube, especially in the struggle of St. the Bragia (1593-1601) against the Turks, and in the later Russo-Turkish Wars. It was burned in 1659. In 1829, its fortifications were finally razed, the only defence left being a castle on the island of Slobozia, united to the shore by a bridge.

GIUSTI, GIUSEPPE (1800-1850), Tuscan satirical poet, was born at Monsummano, a small village of the Valdiccione, on the 12th of May 1800. His father, a cultivated and rich man, accustomed his son from childhood to study, and himself taught him, among other subjects, the first rudiments of music. Afterwards, in order to curb his too vivacious disposition, he placed the boy under the charge of a priest near the village, whose severity did perhaps more evil than good. At twelve Giusti was sent to school at Florence, and afterwards to Pistoia and to Lucca; and during those years he wrote his first verses. In 1826 he went to study law at Pisa; but, differing from his studies, he spent eight years in the course, instead of the customary four. He lived gaily, however, though his father kept him short of money, and learned to know the world, seeing the vicissitudes of society, and the folly of certain laws and customs from which his country was suffering. The experience thus gained he turned to good account in the use he made of it in his satire.

His father had in the meantime changed his place of abode to Pesca; but Giuseppe did worse there, and in November 1832, his father having paid his debts, he returned to study at Pisa, seriously enamoured of a woman whom he could not marry, but now commencing to write in true earnest in behalf of his country. With the poem called La Ghigiotitina (the guillotine), Giusti began to strike out a path for himself, and thus revealed his great genius. From this time he showed himself the Italian Béranger, and even surpassed the Frenchman in richness of language, refinement of humour and depth of satirical conception. In Béranger there is more feeling for what is needed for popular poetry. His poetry is less studied, its vivacity perhaps more maintained, more spirit and quickness of conception, is perhaps more elegant, more refined, more penetrating. In 1834 Giusti, having at last entered the legal profession, left Pisa to go to Florence, nominally to practise with the advocate Capoquadri, but really to enjoy life in the capital of Tuscany. He fell seriously in love a second time, and as before was abandoned by his love. It was then he wrote his finest verses, by means of which, although his poetry was not yet collected in a volume, but for some years passed from hand to hand, his name gradually became famous. The greater part of his poems were published clandestinely at Lucca, at no little risk, as the work was destined to undermine the Austrian rule in Italy. After the publication of a volume of verses at Bastia, Giusti thoroughly established his fame by his Gingillino, the best in moral tone as well as the most vigorous and effective of his poems. The poet sets himself to represent the wileness of the treasury officials, and the base means they used to conceal the necessities of the state. The Gingillino has all the character of a classic satire. When first issued in Tuscany, it struck all those who read it as touching and personal. Giusti entered heart and soul into the political movements of 1847 and 1848, served in the national guard, sat in the parliament for Tuscany; but finding that there was more talk than action, that to the tyranny of princes had succeeded the tyranny of demagogues, he began to fear, and to express the fear, that for Italy evil rather than good had resulted. He fell, in consequence, from the high position he had held in public estimation, and in 1848 was regarded as a reactionary. His friendship for the marquis Gino Capponi, who had taken him into his house during the last years of his life, and who published after Giusti's death a volume of illustrated proverbs, was enough to compromise him in the eyes of such men as Guerrazzi, Montanelli and Niccolini. On the 31st of May 1850 he died at Florence in the palace of his friend.

The poetry of Giusti, under a light trivial aspect, has a lofty civilizing significance. The type of his satire is entirely original, and it had also the great merit of appearing at the right moment, of wounding judiciously, of sustaining the part of the comedy that castigat riga mala. Hence his verse, apparently shallow and indifferent, received by the scholars and politicians of Italy in all seriousness. Alexander Manzoni in some of his letters showed a hearty admiration of the genius of Giusti; and the weak Austrian and Bourbon governments regarded them as of the gravest importance.

His poems have often been reprinted, the best editions being those of Le Monnier, Carducci (1889; 3rd ed., 1879), Fioret (1876) and Bragi (1890). Besides the poems and the proverbs already mentioned, we have a volume of select letters, full of vigour and written in the best Tuscan language, and a fine critical discourse on Giuseppe Parini, the satirical poet. In some of his compositions the elegiac rather than the satirical poem is seen. Many of his verses have been excellently translated into German by Paul Heyse. Good English translations were published in the Athenaum by Mrs T. A. Trollope, and some by W. D. Howells in his Modern Italian Poets (1887).

GIUSTINIANI, the name of a prominent Italian family which originally belonged to Venice, but established itself subsequently in Genoa also, and at various times had representatives in Naples, Corsica and several of the islands of the Archipelago.

In the Venetian line the following are most worthy of mention:—
1. Lorenzo (1380-1465), the Laurentius Justinianus of the Roman calendar, at an early age entered the congregation of the canons of St George in Alga, and in 1433 became general of that order. About the same time he was made by Eugenius IV. bishop of Venice; and his episcopate was marked by considerable activity in church extension and reform. On the removal of the patriarchate from Grado to Venice by Nicholas V. in 1451, Justiniani was promoted to be both in manner and held for fourteen years. He died on January 8, 1465, was canonized by Pope Alexander VIII, his festival (semi-duplex).
GIUSTO DA GUANTO

55

being fixed by Innocent XII. for September 5th, the anniversary of his elevation to the bishopric. His works, consisting of sermons, letters and ascetic treatises, have been frequently reprinted, the best edition being that of the Benedictine Fr. P. Ghinzing, published at Venice in 4 vols. from 1751. They are wholly devoted of literature. His life has been written by Bernard Giustiniani, by Maffei and also by the Bollandists.

2. Leonardo (1388-1446), brother of the preceding, was for some years a senator of Venice, and in 1443 was chosen procurator of St. Mark. He translated into Italian Plutarch's Lives of Cinna and Lucullus, and was the author of some poetical pieces, amatory and religious—strambotti and canzoneiti—as well as of rhetorical prose compositions. Some of the popular songs set to music by him became known as Giustiniani.

3. Bernardo (1498-1549), son of Leonardo, was a pupil of Guarino and of George of Trebizond, and entered the Venetian senate at an early age. He served on several important diplomatic missions both to France and Rome, and about 1485 became one of the council of ten. His orations and letters were published in 1492; but his title to any measure of fame he possesses rests upon his history of Venice, De origine urbis Venetarum rebusque ab ipso gestis historia (1492), which was translated into Italian by Domenichi in 1545, and which at the time of its appearance was undoubtedly the best work upon the subject of which it treated. It is to be found in vol. i. of the Thesaurus of Graevius.

4. Pietro, also a senator, lived in the 16th century, and wrote on Historia rerum Venetarum in continuation of that of Bernardo. He was also the author of chronicles De gestis Petri Mocenigi and De bello Venetorum cum Carolo VIII. The latter has been reprinted in the Script. rer. Ital. vol. xxl.

Of the Genoese branch of the family the most prominent members were the following:

5. Paolo, de Monteleone (1444-1502), a member of the order of Dominicans, was, from a comparatively early age, prior of their convent at Genoa. As a preacher he was very successful, and his talents were fully recognized by successive popes, by whom he was made master of the sacred palace, inquisitor-general for all the Genoese dominions, and ultimately bishop of Sien and Hungarian legate. He was the author of a number of Biblical commentaries (no longer extant), which are said to have been characterized by great erudition.

6. Giacomo (1520-1550) was born at Genoa, and spent some wild years in Valencia, Spain. Having in 1487 joined the Dominican order, he gave himself with great energy to the study of Greek, Hebrew, Chaldean and Arabic, and in 1514 began the preparation of a polyglot edition of the Bible. As bishop of Nebbio in Corsica, he took part in some of the earlier sittings of the Lateran council (1516-1517), but, in consequence of party complications, withdrew to his diocese, and ultimately to France, where he became a pensioner of Francis I., and was the first to occupy a chair of Hebrew and Arabic in the university of Paris. After an absence from Corsica for a period of five years, during which he visited England and the Low Countries, and became acquainted with Erasmus and More, he returned to Nebbio, about 1522, and there remained, with comparatively little intermission, till in 1536, when, while returning from a visit to Genoa, he perished in a storm at sea. He was the possessor of a very fine library, which he bequeathed to the republic of Genoa. Of his projected polyglot only the Psalter was published (Psalterium Hebraicum, Graecum, Arabicum, et Chaldeicum, Genoa, 1616). Besides the Hebrew text, the LXX. translation, the Chaldee paraphrase, and an Arabic version, it contains the Vulgate translation, a new Latin translation by the editor, a Latin translation of the Chaldee, and a collection of scholia. Giustiniani printed 2000 copies at his own expense, including fifty in vellum for presentation to the sovereigns of Europe and Asia; but the sale of the work did not encourage him to proceed with the New Testament, which he had also prepared for the press. Besides an edition of the book of Job, containing the original text, the Vulgate, and a new translation, he published a Latin version of the Meshv Nevehchim of Maimonides (Director du bistandium avt perplexarum, 1520), and also edited in Latin the Auresus libellus of Acenus Platonicus, and the Timaeus of Chalcidius. His annals of Genoa (Casiglissiannis annali di Genova) were published posthumously in 1537.

The following are also noteworthy:

7. Pompeo (1569-1616), a native of Corsica, who served under Alessandro Farnese and the marquis of Spinola in the Low Countries, where he lost an arm, and, from the artificial substitute which he wore, came to be known by the sobriquet Bras de Fer. He also defended Crete against the Turks; and subsequently was killed in a reconnaissance at Frilli. He left in Italian a personal narrative of the war in Flanders, which has been repeatedly published in a Latin translation (Bellum Belgicum, Antwerp, 1609).

8. Giovanni (1553-1558), born in Candida, translator of Terence's Andria and Eunuchus, of Cicero's In Verrem, and of Virgil's Aeneid, viii.

9. Orsatto (1538-1603), Venetian senator, translator of the Oedipus Tyrannus of Sophocles and author of a collection of Rime, in imitation of Petrarcl. He is regarded as one of the latest representatives of the classic Italian school.

10. Gerontimo, a Genoese, flourished during the latter half of the 16th century. He translated the Alcestis of Euripides and three of the plays of Sophocles; and wrote two original tragedies, Jephte and Cristo in Passione.

11. Vincenzo, who in the beginning of the 17th century built the Roman palace and made the art collection which are still associated with his name (see Galleria Giustiniana, Rome, 1631). The collection was removed in 1807 to Paris, where it was to some extent broken up. In 1815 all that remained of it, about 170 pictures, was purchased by the king of Prussia and removed to Berlin, where it forms a portion of the royal museum.

GIUSTO DA GUANTO [Jodocus, or] JUSTUS, OF GENOA (fl. 1465-1475), Flemish painter. The public records of the city of Ghent have been diligently searched, but in vain, for a clue to the history of Justus or Jodocus, whom Vasari and Guicciardini called Giusto da Guanto. Flemish annalists of the 16th century have enlarged upon the scanty statements of Vasari, and described Jodocus as a pupil of Hubert Van Eyck. But there is no source to which this fable can be traced. The registers of St Luke's guild at Ghent comprise six masters of the name of Joos or Jodocus who practised at Ghent in the 15th century. But none of these works is of this period; it has been preserved, and it is impossible to compare their style with that of Giusto. It was between 1465 and 1474 that this artist executed the "Communion of the Apostles" which Vasari has described, and modern critics now see to the best advantage in the museum of Urbino. It was painted for the brotherhood of Corpus Christi at the bidding of Frederick of Montefeltro, who was introduced into the picture as the companion of Caterino Zeno, a Persian envoy at that time on a mission to the court of Urbino. From this curious production it may be seen that Giusto, far from being a pupil of Hubert Van Eyck, was merely a disciple of a later and less gifted master, who took to Italy some of the peculiarities of his native schools, and forthwith commingled them with those of his adopted country. As a composer and draughtsman Giusto compares unfavourably with the better-known painters of Flanders; though his portraits are good, his ideal figures are not remarkable for elevation of type or for subtlety of character and expression. His work is technically on a level with that of Gerard of St John, whose pictures are preserved in the Belvedere at Vienna. Vespuian, a Florentine bookseller who contributed much to form the ante main style of Frederick of Montefeltro, states that this duke sent to the Netherlands for a capable artist to paint a series of "ancient worthies" for a library recently erected in the palace of Urbino. It has been conjectured that the author of these "worthies," which are still in existence at the Louvre and in the Barberini palace at Rome, was Giusto. Yet there are notable divergences between these pictures and the "Communion of the Apostles." Still, it is not beyond the range of probability that Giusto should have been able, after a certain
time, to temper his Flemish style by studying the masterpieces of Santì and Molèzzo, and so to acquire the mixed manner of the Flemings and Italians which these portraits of worthies display. Such an assimilation, if it really took place and enabled him to understand the Flemings in the indulgence of a certain pride, considering that Raphael not only admired these worthies, but copied them in the sketch-book which is now the ornament of the Venetian Academy. There is no ground for presuming that Giusto ad Guanto is identical with Justus d’Allamagna who painted the "Annunciation" (1451) in the cloisters of Santa Maria di Castello at Genoa. The drawing and colouring of this wall painting shows that Justus d’Allamagna was as surely a native of south Germany as his homonym at Urbino was a born Netherlander.

GIVET, a town of northern France, is situated on the Meuse about 1 m. from the Belgian frontier, and was formerly a fortress of considerable importance. It is divided into three portions—the citadel called Charlemont and Grand Givet on the left bank of the river, and on the opposite bank Petit Givet, connected with Grand Givet by a stone bridge of five arches. The fortress of Charlemont was the site of a precipitous rock 205 ft. high, which was founded by the emperor Charles V. in the 16th century, and further fortified by Vauban at the end of the 17th century; it is the only survival of the fortifications of the town, the rest of which were destroyed in 1802. In Grand Givet there are a church and a town-hall built by Vauban, and a statue of the composer Étienne Méhul stands in the fine square named after him. Petit Givet, the industrial quarter, is traversed by a small tributary of the Meuse, the Houille, which is bordered by tanneries and glue factories. Pencils and tobacco-pipes are also manufactured. The town has considerable river trade, consisting chiefly of coal, copper and stone. There is a chamber of arts and manufactures.

GIVORS, a manufacturing town of south-eastern France, in the department of Rhône, on the railway between Lyons and St. Etienne, 14 m. S. of Lyon. Pop. (1906) 11,444. It is situated on the right bank of the Rhone, here crossed by a suspension bridge, at its confluence with the Gier and the canal of Givors, which starts at Grand Croix on the Gier, some 13 m. distant. The chief industries are metal-working, engineering-construction and canal-working. There are coal mines in the vicinity. On the hill overlooking the town are the ruins of the château of St. Gerald and of the convent of St. Ferréol, remains of the old town destroyed in 1594.

GJALLAR, in Scandinavian mythology, the horn of Heimdall, the guardian of the rainbow bridge by which the gods pass and re-pass between earth and heaven. This horn had to be blown whenever a stranger approached the bridge.

GLABRIO. 1. MANUS ACILIVS GLABRIO, Roman statesman and general, member of a plebeian family. When consul in 192 B.C. he defeated Antiochus the Great of Syria at Thermopylae, and compelled him to leave Greece. He then turned his attention to the Aetolians, who had persuaded Antiochus to declare war against Rome, and was only prevented from crushing them by the intercession of T. Quinctius Flaminius. In 189 Glabrio was a candidate for the censorship, but was bitterly opposed by the nobles. He was accused by the tribunes of having concealed a portion of the Syrian spoils in his own house; his legate gave evidence against him, and he withdrew his candidacy. It is probable that he was the author of the law which left it to the discretion of the pontiffs to insert or omit the intercalary month of the year.

Censorinus, De die natali, xx.; Macrobius, Saturnalia, i. 13; index to Livy; Appian, Syr. 17-21.

2. MANUS ACILIVS GLABRIO, Roman statesman and general, grandson of the famous jurist P. Mucius Scaevola. When praetor urbanus (70 B.C.) he presided at the trial of Verres. According to Dio Cassius (xxxvi., 38), in conjunction with L. Calpurnius Piso, his colleague in the consulship (67), he brought forward a severe law (Lex Aelilia Calpurnia) against illegal canvassing at elections. In the same year he was appointed to supersede L. Lucullus in the government of Cilicia and the command of the war against Mithradates, but as he did absolutely nothing and was unable to control the soldiery, he was in turn superseded by Pompey according to the provisions of the Manilian law. Little else is known of him except that he declared in favour of the death penalty for the Catilinarian conspirators.

Dio Cassius xxxvi. 14, 16. 24; Cicero, Pro lege Manilia, 2. 9; Appian, Mithrid. 90.

GLACE BAY, a city and port of entry of Cape Breton county, Nova Scotia, Canada, on the Atlantic Ocean, 12 m. E. of Sydney, and is connected both by steam and electric railway. It is the centre of the properties of the Dominion Coal Company (founded 1893), which produce most of the coal of Nova Scotia. Although it has a fair harbour, most of the shipping is done from Sydney in summer and from Louisbourg in winter. Pop. (1892) 2000; (1901) 6945; (1906) 13,000.

GLACIAL PERIOD, in geology, the name usually given, by English and American writers, to that comparatively recent time when all parts of the world suffered a marked lowering of temperature, accompanied in northern Europe and North America of submergence, as well as with the modern glacial conditions not entirely in name, which now characterize the Polar regions. This period, which is also known as the "Great Ice Age" (German Die Eisezeit), is synchronous with the Pleistocene period, the earliest of the Post-Tertiary or Quaternary divisions of geological time. Although "Glacial period" and "Pleistocene period" (q.v.) are often used synonymously it is convenient to consider them separately, inasmuch as not a few Pleistocene formations have no causal relationship with the conditions of glaciation. Not until the beginning of the 19th century did the deposits now generally recognized as the result of glacial action receive serious attention; the tendency was to regard such superficial and irregular material as mere rubbish. Early ideas upon the subject usually assigned the deposits to the more recent forms of the oceanic agency, and this view is still not without its supporters (see Sir H. H. Howorth, The Glacial Nightmare and the Flood). Doubtless this attitude was in part due to the comparative rarity of glaciers and ice-fields where the work of ice could be directly observed. It was natural therefore that the first scientific references to glacial action should have been stimulated by the Alpine regions of Switzerland, which called forth the writings of J. J. Scheuchzer, B. F. Kuhn, H. B. de Saussure, F. G. Hugi, and particularly those of J. Venedt, J. G. von Charpentier and L. Agassiz. Canon Rendu, J. Forbes and others had studied the cause of motion of glaciers, while keen observers, notably Sir James Hall, A. Bronniant and J. Playfair, had noted the occurrence of travelled and scratched stones.

The result of these efforts was the conception of great ice-sheets flowing over the land, grinding the rock surfaces and transporting rock débris in the manner to be observed in the existing glaciers. However, before this view had become established Sir C. Lyell evolved the "drift theory" to explain the widely spread phenomenon of transported blocks, boulder clay and the allied deposits; in this he was supported by Sir H. de la Beche, Charles Darwin, Sir R. I. Murchison and many others. According to the drift theory, the transport and distribution of "erratic blocks," &c., had been effected by floating icebergs; this view naturally involved a considerable and widespread submergence of the land, an assumption which appeared to receive support from the occasional presence of marine shells at high levels in the "drift" deposits. So great was the influence of those who favoured the drift theory that even to-day it cannot be said to have lost complete hold; we still speak of "drift" deposits in England and America, and the belief in one or more great submergences during the Glacial period is still held more firmly by certain geologists than the evidence would seem to warrant. The case against the drift theory was most clearly expressed by Sir A. C. Ramsay for England and Scotland, and by the Swedish scientist Otto Tordil. Since then the labours of Professor James Geikie, Sir Archibald Geikie, Professor F. Kendall and
GLACIAL PERIOD

being more or less restricted laterally by the valleys in which they flow, the general results of their passage over the rocky floor are essentially similar. Smooth rounded outlines are imparted to the rocks, markedly contrasted with the pinnacled and irregular surfaces produced by ordinary weathering; where these rounded surfaces have been formed on a minor scale the well-known features of roches moutonnées (German Runnhöcker) are created; on a larger scale we have the erosion-formed known as "crag and tail," when the ice-sheet has overridden ground with more pronounced contours, the side of the hill facing the advancing ice being rounded and gently curved (German Stossseite), and the opposite side (Leeseite) steep, abrupt and much less smooth. Such features are never associated with the erosion of water. The rounding of rock surfaces is regularly accompanied by grooving and striation (German Schrammen, Schliff) caused by the grinding action of stones and boulders embedded in the moving ice. These "glacial striae" are of great value in determining the latest path of the vanished ice-sheet (see map). Several other erosion features are generally associated with ice action; such are the circular-headed valleys, "circles" or "corries" (German Zirhbus) of mountain districts; the pot-holes, giants' kettles (Strudelklober, Riesentöpfe), familiarly exemplified in the Gletschergarten near Lucerne; the "rock-basins" (Felsascheiben) of mountainous regions are also believed to be assignable to this cause on account of their frequent association with other glacial phenomena, but it is more than probable that the action of running water (waterfalls, &c.)—

influenced no doubt by the disposition of the ice—has had much to do with these forms of erosion. As regards rock-basins, geologists are still divided in opinion: Sir A. C. Ramsay, J. Geikie, Tyrrell, Heald, H. Hess, A. Penck, and others have expressed themselves in favor of a glacial origin; while A. Lampert, H. Hatt, T. Kirgis, L. Rüllmeyer and many others have strongly opposed this view.

2. Glacial deposits may be roughly classified in two groups: those that have been formed directly by the action of the ice, and those formed through the agency of water flowing under, upon, and from the ice-sheets, or in streams and lakes modified by the presence of the ice. To differentiate in practice between the results of these two agencies is a matter of some difficulty in the case of unstratified deposits; but the boulder clay may be taken as the typical formation of the glacier or ice-sheet, whether it has been left as a terminal moraine at the limit of glaciation or as a ground moraine beneath the ice. A stratified form of boulder clay, which not infrequently rests upon, and is therefore younger than, the more typical variety, is usually regarded as a deposit formed by water from the material (englacial, innermorainis) held in suspension within the ice, and set free during the process of melting. Besides the innumerable boulders, large and small, embedded in the boulder clay, isolated masses of rock, often of enormous size, have been borne by ice-sheets far from their original home and stranded when the ice melted. These "erratic blocks," "perched blocks" (German Findlinge) are familiar objects in the Alpine glacier districts, where they have frequently received individual names, but they are just as easily recognized in regions from which the glaciers that brought them there have long since been banished. Not only did the ice transport blocks of hard rock, granite and the like, but huge masses of stratified rock were torn from their bed by the same agency; the masses of chalk in the cliffs near Cromer are well known; near Berne, at Fritikswald, there is a transported mass of chalk estimated to be at least 2,000,000 cubic metres in bulk, which has travelled probably 15 kilometres from its original site; a block of Lincolnshire oolite is recorded by C. Fox-Strangeways near Melton in Leicestershire, which is 300 yds. long and 100 yds. broad if no more; and instances of a similar kind might be multiplied.

When we turn to the "fluvio-glacial" deposits we find a bewildering variety of stratified and partially bedded deposits of gravel, sand and clay, occurring separately or in every conceivable combination of association. Some of these deposits have received distinctive names; such are the "Kames" of Scotland, which are represented in Ireland by "Eskers," and in Scandinavia by "Åsar." Another type of hillocky deposit is exemplified by the "drums" or "drumlins." Everywhere beyond the margin of the advancing or retreating ice-sheets these deposits were being formed; streams bore away coarse and fine materials and spread them out upon alluvial plains or upon the floors of innumerable lakes, many of which were directly caused by the damming of the ordinary water-courses by the ice. As the level of such lakes was changed new beach-lines were produced, such as are still evident in the great lake region of North America, in the parallel roads of Glen Roy, and the "Strandlinien" of many parts of northern Europe.

Viewed in relation to man's position on the earth, no geographical changes have had a more profound importance than those of the Glacial period. The whole of the glaciated region bears evidence of remarkable modification of topographic features; in parts of Scotland or Norway or Canada the old rocks are bared of soil, rounded and smoothed as far as the eye can see. The old soil and subsoil, the product of ages of ordinary weathering, were removed from vast areas to be deposited and concentrated in others. Old valleys were filled—often to a great depth, 300-400 ft.; rivers were diverted from their old courses, never to return; lakes of vast size were caused by the damming of old outlets (Lake Lahontan, Lake Agassiz, &c., in North America), while an infinite number of shifting lakes—witn their deposits—played an important part along the ice-front at all stages of its career. The influence of this period upon the present
distribution of plant and animal life in northern latitudes can hardly be overestimated.

Much stress has been laid upon supposed great changes in the level of the land in northern regions during the Glacial period. The occurrence of marine shells at an elevation of 1350 ft. at Moel Tryfaen in north Wales, and at 1200 ft. near Macclesfield in Cheshire, has been cited as evidence of profound submergence by some geologists, though others see in these and similar occurrences only the transporting action of ice-sheets that have traversed the floor of the adjoining seas. Marine shells in stratified materials have been found on the coast of Scotland at 100 ft. and over, in S. Scandinavia at 600 to 800 ft., and in the "Champlain" deposits of North America at various heights. The dead shells of the "Yoldia clay" cover wide areas at the bottom of the North Atlantic at depths from 500 to 1300 fathoms, though the same mollusc is now found living in Arctic seas at the depth of 2 to 15 fathoms. This has been looked upon as a proof that in the N.W. European region the lithosphere stood about 2000 ft. higher than it does now (Brøgger, Nansen, &c.), and it has been suggested that a union of the mainland of Europe with that of North America—forming a northern continental mass, "Prosarctic"—may have been achieved by way of Iceland, Jan Mayen Land and Greenland. The pre-glacial valleys and fjords of Norway and Scotland, with their deeply submerged seaward ends, are regarded as proofs of former elevation. The great depth of alluvium in some places (236 metres at Bremen) points in the same direction. Evidences of changes of level occur in early, middle and late Pleistocene formations, and the nature of the evidence is such that it is on the whole safer to assume the existence only of the more moderate degree of change.

The Cause of the Glacial Period.—Many attempts have been made to formulate a satisfactory hypothesis that shall conform with the known facts and explain the great change in climatic conditions which set in towards the close of the Tertiary era, and culminated during the Glacial period. Some of the more prominent hypotheses may be mentioned, but space will not permit of a detailed analysis of theories, most of which rest upon somewhat unsubstantial ground. The principal facts to be taken into consideration are: (1) the great lowering of temperature over the whole earth; (2) the localization of extreme glaciation in north-west Europe and north-east America; and (3) the local retrogression of the ice-sheets, once or more times repeated.

Some have suggested the simple solution of a change in the earth's axis, and have indicated that the pole may have travelled through some 15° to 20° of latitude; thus, the polar glaciation, as it now exists, might have been in this way transferred to include northwest Europe and North America; but modern views on the rigidity of the earth's body, together with the lack of any evidence of the correlative movement of climatic zones in other parts of the world, render this hypothesis quite untenable. On similar grounds a change in the earth's centre of gravity is unthinkable. Theories based upon the variations in the obliquity of the ecliptic or eccentricity of the earth's orbit, or on the passage of the solar system through cold regions of space, or upon the known variations in the heat emitted by the sun, are all insecure and unsatisfactory. The hypothesis elaborated by James Croll (Phil. Mag., 1864, 28, p. 121; Climate and Time, 1875; and Discussion on Climate and Cosmology, 1889) was founded upon the assumption that with the earth's eccentricity at its maximum and winter in the north at aphelion, there would be a tendency in northern latitudes for the accumulation of snow and ice, which would be accentuated indirectly by the formation of fogs and a modification of the trade winds. The shifting of the thermal equator, and with it the direction of the trade winds, would divert some of the warm ocean currents from the cold regions, and this effect was greatly enhanced, he considered, by the configuration of the Atlantic Ocean. Croll's hypothesis was supported by Sir R. Ball (The Cause of the Great Ice Age, 1893), and it met with very general acceptance; but it has been destructively criticized by Professor S. Newcomb (Phil. Mag., 1876, 1883, 1884) and by E. P. Culverwell (Phil. Mag., 1894, p. 541, and Geol. Mag., 1895, pp. 3 and 55). The difficulties in the way of Croll's theory are: (1) the fundamental assumption, that midwinter and midsummer temperatures are directly proportional to the sun's heat at those periods, is not in accordance with observed facts; (2) the glacial periods would be limited in duration to an appropriate fraction of the precessional period (21,000 years), which appears to be too short a time for the work that was actually done by ice agency; and (3) Croll's glacial periods would alternate between the northern and southern hemispheres, affecting first one then the other. Sir C. Lyell and others have advocated the view that great elevation of the land in polar regions would be conducive to glacial conditions; this is doubtless true, but the evidence that the Glacial period was primarily due to this cause is not well established. Other writers have endeavoured to support the elevation theory by combining with it various astronomical and meteorological agencies. More recently several hypotheses have been advanced to explain the glacial period as the result of changes in the atmosphere; F. W. Harmer ("The Influence of Winds upon the Climate during the Pleistocene Epoch," O.J.G.S., 1901, 37, p. 405) has shown the importance of the influence of winds in certain circumstances; Marsden Manson ("The Evolution of Climate," American Geologist, 1890, 24, p. 93) has laid stress upon the influence of clouds; but neither of these theories grapples successfully with the fundamental difficulties. Others again have requisitioned the variability in the amount of the carbon dioxide in the atmosphere—hypotheses which depend upon the efficiency of this gas as a thermal absorber. The supply of carbon dioxide may be increased from time to time, as by the emanations from volcanoes (S. Arrhenius and A. G. Högboöm), or it may be decreased by absorption into sea-water, and by the carbonation of rocks. Professor T. C. Chamberlin based a theory of glaciation on the depletion of the carbon dioxide of the air ("An Attempt to frame a Working Hypothesis of the cause of Glacial Periods on an Atmospheric Basis," Jl. Geol., 1896, vii. 752-771; see also Chamberlin and Salisbury, Geology, 1906, ii. 674 and iii. 432). The outline of this hypothesis is as follows: The general conditions for glaciation were: (1) that the oceanic circulation was interrupted by the existence of land; (2) that vertical circulation of the atmosphere was accelerated by continental and other influences; (3) that the thermal blanketing of the earth was reduced by a depletion of the moisture and carbon dioxide in the atmosphere, and that hence the average temperature of the surface of the earth and of the body of the ocean was reduced, and diversity in the distribution of heat and moisture introduced. The localization of glaciation is assignable to the two great areas of permanent atmospheric depression that have their present centres over Greenland and the Aleutian Islands respectively. The periodicity of glacial advances and retreats, demanded by those who believe in the validity of so-called "interglacial" epochs, is explained by a series of complicated processes involving the alternate depletion and completion of the normal charge of carbon dioxide in the air.

Whatever may be the ultimate verdict upon this difficult subject, it is tolerably clear that no simple cause of glacial conditions is likely to be discovered, but rather it will appear that these conditions resulted from the interaction of a complicated series of factors; and further, until a greater degree of unanimity can be approached in the interpretation of observed facts, particularly as regards the substantiality of interglacial epochs, the very foundations of a sound working hypothesis are wanting.

Classification of Glacial Deposits—Interglacial Epochs.—Had the deposits of glaciated regions consisted solely of boulder clay little difficulty might have been experienced in dealing with their classification. But there are intercalated in these boulder clays those irregular stratified and partially stratified masses of sand, gravel and loam, frequently containing marine or freshwater shells and layers of peat with plant remains, which have given rise to the conception of "interglacial epochs"—
pauses in the rigorous conditions of glaciation, when the ice-sheets dwindled almost entirely away, while plants and animals re-established themselves on the newly exposed soil. Glacialists may be ranged in two schools: those who believe that one or more phases of milder climatic conditions broke up the whole Glacial period into alternating epochs of glaciation and "de-glaciation"; and those who believe that the intercalated deposits represent rather the localized recessional movements of the ice-sheets or the occasional movements of the ice-limbs during the Glacial period. In addition to the stratified deposits and their contents, important evidence in favour of interglacial epochs occurs in the presence of weathered surfaces on the top of older boulder clays, which are themselves covered by younger glacial deposits.

The cause of the interglacial hypothesis has been most ardently championed in England by Professor James Geikie; who has endeavoured to show that there were in Europe six distinct interglacial epochs within the Glacial period, separated by five epochs of more moderate temperature. These are enumerated below:

6th Glacial epoch, Upper Turiatarian, indicated by the deposits of peat which underlie the lower raised beaches.

5th Inter-glacial epoch, Upper Forestian.

5th Glacial epoch, Lower Turiatarian, indicated by peat deposits overlying the lower forest-bed, by the raised beaches and morainic clays of Scotland, and the "littorina" beds of Scandinavia.

4th Inter-glacial epoch, Lower Forestian, the lower forests making an appearance in the peat beds, the Ancylus-beds of the great fresh-water Baltic lake and the Littorina-clay of the Baltic basin.

4th Glacial epoch, Mecklenburgian, represented by the moraines of the last great Baltic glacier, which reach their southern limit in Mecklenburg; the 100-ft. terrace of Scotland and the Yoldia-clay of Scandinavia.

3rd Inter-glacial epoch, Neuchetian, intercalations of marine and fresh-water deposits in the boulder clays of the southern Baltic coasts.

3rd Glacial epoch, Poelitian, glacial and fluvo-glacial formations of the minor Scandinavian ice-sheet; and the "upper boulder clay" of northern and western Europe.

2nd Inter-glacial epoch, Hekehtian, Inter-glacial beds of Britain and Lignites of Switzerland.

2nd Glacial epoch, Saxonian, deposits of the period of maximum glaciation when the northern ice-sheet reached the low ground of Saxony. The other minor centres formed on the most southern points.

1st Inter-glacial epoch, Norfoleian, the forest-bed series of Norfolk, 1st Glacial epoch, Scanian, represented only in the south of Sweden, which was overthrown by a large Baltic glacier. The Chilostem clay and Weybourne clay of Norfolk and the oldest moraines and fluvo-glacial gravels of the Arctic lands may belong to this epoch.

In a similar manner Professor Chamberlin and other American geologists have recognized the following stages in the glaciation of North America:

The Champlain, marine substage.

The Glacio-lacustrine substage.

The later tillian (6th glacial).

The fifth interglacial.

The earlier Wisconsin (4th glacial).

The Pleistocene (4th interglacial).

The lowan (3rd glacial).

The Sangamon (3rd interglacial).

The Illinoian (3rd glacial).

The Pliocene or Buchanan (2nd interglacial).

The Kansan (2nd glacial).

The Aftonian (1st interglacial).

The sub-Aftonian or Jeseyan (1st glacial).

Although it is admitted that no strict correlation of the European and North American stages is possible, it has been suggested that the Aftonian may be the equivalent of the Helvetian; the Kansan may represent the Saxonian; the Iowan, the Polishian; the Jeseyan, the Wisconsarian; and the Early Wisconsinian. But considering how fragmentary is the evidence in favour of these stages both in Europe and America, the value of such attempts at correlation must be very small. This is the more evident in it is suggested that there are other geologists of equal eminence who are unable to accept so large a number of epochs after a close study of the local circumstances; thus, in the subjoined scheme for north Germany, after H. W. Münthe, there are three glacial and two interglacial epochs.

Post-Glacial epoch

1st Inter-glacial epoch

1st Glacial epoch, "older boulder clay.

Again, in the Alps four interglacial epochs have been recognized; while in England there are many who are willing to concede one epoch to each of the Pliocene and Pleistocene, and all glacialists (G. W. Lamplugh, Address, Section C, Brit. Assoc., York, 1906).

This great diversity of opinion is eloquent of the difficulties of the subject, and it is impossible not to see that the discovery of interglacial epochs bears a close relationship to the origin of certain hypotheses of the cause of glaciation; while it is significant that those who have worked most into the actual history of glaciation have been less at a loss in finding good evidence of such definite ameliorations of climate, than those who have founded their views upon the examination of numerous, but isolated areas.

If we consider the ice-sheets of the kind cited above, it appears that during the glacial period a series of great ice-sheets covered enormous areas in North America and north-west Europe. The area covered during the latter part of the Wisconsin epoch is reckoned at 20 million square kilometres (nearly 8 million sq. m, in North America and 6 million square kilometres (about 2.3 million sq. m, in Europe.

In Europe three great centres existed from which the ice-streams radiated; foremost in importance was the region of Fennoscandia (the name for Scandinavia with Finland as a single geographical region); from the centre the ice spread out far into Germany and Russia and westward, to the shores of Britain. The southern boundary of the ice extended from the estuary of the Rhine in an irregular series of lobes along the Schiefergebirge, Harz, and the Harz-Bavarian ridges, across the Steiermark to the flanks of the Carpathians towards Cracow. Down the valley of the Dunajec a lobe of the ice-sheet projected as far as 40° 50' N.; reaching the valley of the Vistula on the other side of the Danzig peninsula, the boundary runs north-easterly towards the Ural and the Kara Sea. The British Islands constituted the centre second in importance; Scotland, Ireland and all but the southern part of England were covered by a moving ice; the Rhine glacier at its maximum filled up the Rhine valley, and covered the shores of Geneva and the plain between the Bernese Oberland and the Jura; it even overrode the latter and advanced towards Besançon. Extensive glaciation was not limited to the aforesaid regions, for all the high ground of the central parts of Europe was covered with ice and developed; the Pyrenees, the central highlands of France, the Vosges, Black Forest, Apennines and Caucasus were centres of minor but still important glaciation.

The greatest expansion of ice-sheets was located on the North American continent; here, too, there were three principal centres of outflow: the Cordilleran ice-sheets of the N.W., the Keewatin, radiating from the Hudson Bay, and the eastern Labrador or Laurentide sheet. From each of these centres the ice poured outwards in every direction, but the principal flow in each case was towards the south-west. In the north central part of the glaciated area, the direction was as an irregular line along a 49° parallel in the western part of the continent, thence it follows the Mississippi valley down to its junction with the Ohio (southern limit about 39° N.), eastward it follows the direction of the Hudson Bay, and turns north-eastward in the direction of New Jersey. As in Europe, the mountainous regions of North America produced their own local glaciers; in the Rockies, the Olympics and Sierras, the Bighorn Mountains of Wyoming, the Uinta Mountains of Utah, &c. Although it was in the northern hemisphere that the most extensive glaciation took place, the effects of a general lowering of temperature seem to have been sufficient to limit the mountainous regions of all parts; thus in South America, New Zealand, Australia and Tasmania glaciers reached down the valleys far below the existing limits, and even where none are now to be found. In Asia the evidences of a former expansion of the glaciers are traced to the high ranges of China and Eastern Siberia. The same is true of parts of Turkestan and Lebanon. In Africa also, in British East Africa moraines are amply demonstrated 540 ft. below their modern limit. In Iceland and Greenland, and even in the Antarctic, there appears to be evidence of a former greater extension of the ice. It is of interest to note that Alaska seems to be free from excessive glaciation, and that a remarkable "driftless" area lies in Wisconsin. The maximum glaciation of the Glacial period was clearly centred around the North Atlantic.

Glacial Epochs in the Older Geological Periods.—Since Ramsay drew attention to the subject in 1855 (1) On the occurrence of angular, abraded, and polished and striated boulders and pebbles in the Permian Brevia of Shropshire, Worcestershire, &c., and on the probable existence of glaciers and icebergs in the Permian epoch, Q. J., Geol. Soc., 1855, pp. 185-197. (2) He has since been joined by many to such formations. It is now generally acknowledged that the Perm-carboniferous conglomerates with striated boulders and polished rock surfaces, such as are found in the Karoo formation of South Africa, the Tulkir conglomerate of the Salt Range in Indi

The corresponding formations in Australia, represent undeniable
GLACIER

glacial conditions at that period on the great Indo-Australian continent. A glacial origin has been suggested for numerous other conglomeratic formations, such as the Pre-Cambrian Torridonian of Scotland and the Lower Carboniferous conglomerate of parts of England; the Permian breccias of England and parts of Europe; the Triaes of Devonshire; the coarse conglomerates in the Lower Carboniferous of the Miocene of the Ligurian Apennines. In regard to the glacial nature of all these formations there is, however, great divergence of opinion (see A. Helm, "Zur Frage der exotischen Blöcke in Flŷsch").

 Authorities.—The literature dealing directly with the Glacial period has reached enormous dimensions; in addition to the works already mentioned that following may be taken as a general survey of the subject: J. Geikie, The Great Ice Age (3rd ed., London, 1904), also Earth Sculpture (1898); G. F. Wright, The Ice Age in North America (4th ed., New York, 1906) and Man and the Glacial Epoch (New York, 1906); E. Greig, The United Ice Age (Beverly, Mass., 1906); A. Penck and E. Brückner, Die Alpen im Eiszeitalter (Leipzig, 1901-1906, unpublished). Many references to the literature will be found in Sir A. Geikie's Textbook of Geology, vol. ii. (4th ed., 1933); Chamberlin and Salisbury, Geology, vol. iii. (1906). As an example of glacial theories carried beyond the usual limits, see M. Gugenhahn, Die Ergletscherung der Erde von Pole zu Pole (Berlin, 1906). See also Zeitschrift für Gelechrkunde (Berlin, 1906 and onwards quarterly); Sir H. H. Howorth (opposing accepted glacial theories), The Glacial Nightmare and the Flood, i., ii. (London, 1893), Ice and Water, i., ii. (London, 1905), The Mammoth and the Flood (London, 1897) (J. A. H.)

GLACIER (adopted from the French; from glace, ice, Lat. glacies), a mass of compacted ice originating in a snow-field. Glaciers are formed on any portion of the earth's surface where snow is deposited on the snow-line. This line varies locally in the same latitudes, being in some places higher than in others, but in the main it may be described as an elliptical shell surrounding the earth with its longest diameter in the tropics and its shortest in the polar regions, where it touches sea-level. From the extreme regions of the Arctic and Antarctic circles this cold shell swells upwards into a broad dome, from 15,000 to 18,000 ft. high over the tropics, truncating, as it rises, a number of peaks and mountain ranges whose upper portions like all regions above the permanent snow-line will receive all their moisture in the form of snow. Since the temperature above the snow-line is below freezing point evaporation is very slight, and as the snow is solid it tends to accumulate in snow-fields, where the snow of one year is covered by that of the next, and these are wrapped over many deeper layers that have fallen in previous years. If these piles of snow were rigid and immovable they would increase in height until the whole field rose above the zone of ordinary atmospheric precipitation, and the polar ice-caps would add a load to these regions that would produce far-reaching results. The whole central region would rise to a greater height, and all their features would be buried in domes of snow some miles in thickness. When, however, there is sufficient weight the mass yields to pressure and flows outwards and downwards. Thus a balance of weight and height is established, and the ice-field is disintegrated principally at the edges, the surplus in polar regions being carried off in the form of icebergs, and in mountain regions by streams that flow from the melting ends of the glaciers.

Formation.—The formation of glaciers is in all cases due to similar causes, namely, to periodical and intermittent falls of snow. After a snow-fall there is a period of rest during which the snow becomes compacted by pressure and assumes the well-known granular character seen in banks and patches of ordinary snow that lie longest upon the ground when the snow is melting. This is the firm or névé. The next fall of snow covers and conceals the névé, but the light fresh crystals of this new snow in turn become compacted to the coarsely crystalline granular form of the underlying layer and become névé in turn. The process goes on continually; the lower layers become subject to greater and greater pressure, and in consequence become gradually compacted into dense clear ice, which, however, retains its granular crystalline texture throughout. The upper layers of névé are usually stratified, owing to some individual peculiarity in the fall, or to the accumulation of dust or débris upon the surface before it is covered by fresh snow. This stratification is often visible on the emerging glaciers, though it is to be distinguished from the foliation planes caused by shearing movement in the body of the glacier.

Types.—The snow-field upon which a glacier depends is always formed when snow-fall is greater than snow-waste. This occurs under varying conditions with a differentially resulting type of glacier. There are limited fields of snow in many mountain regions giving rise to long tongues of snow which slowly down the valleys and therefore called "valley glaciers." The greater part of Greenland is covered by an ice-cap extending over nearly 400,000 sq. m., forming a kind of enormous continuous glacier on its lower slopes. The Antarctic ice region is believed to extend over more than 3,000,000 sq. m. Each of these continental fields, besides producing block as distinguished from tongue glaciers, sends into the sea a great number of icebergs during the summer season. These ice-caps covering great regions are by far the most important types. Between these "polar" or "continental glaciers," and the "alpine" type there are many grades. Smaller detached ice-caps may rest upon high plateaus as in Iceland, or several tongues of ice coming down neighbouring valleys may spay out into convergent lobes on lower ground and form a "piedmont glacier" such as the Malaspina Glacier in Alaska. When the snow-field lies in a small depression the glacier may remain suspended in the hollow and advance no farther than the edge of the snow-field. This is called a "cliff-glacier," and is not uncommon in mountain regions. The end of a larger glacier, or the edge of an ice-sheet, would reach a precipitous cliff; where the ice-flow against various portions will depend upon the amount of ice and the form of the surface over which the glacier flows. A glacier flowing down a narrow gorge to an open valley, or on to a plain, will spread at its foot into a fan-shaped lobe as the ice spreads outwards while moving downwards. An ice-cap is in the main thickest at the centre, and thins out at the edges. A valley glacier is thickest at some point between its source and its end, but nearer to its source than to its terminus, and the rise steepens as the thickness will depend upon the contour of the valley floor over which the glacier rides, and may reach many hundreds of feet. At its centre the Greenland ice-cap is estimated to be over 5000 ft. thick. In all cases the glacier ends where the waste of ice is greater than the supply, and since the relationship varies in different years, or cycles of years, the end of a glacier may advance or retreat in harmony with greater or less snow-fall or with cooler or hotter summers. There seems to be a cycle of inclusive contraction and expansion of from 35 to 40 or 50 years. At present the ends of the Swiss glaciers are carried on by the work of ice-creep caused by the effects of modern climate due to former extension of the glaciers, and investigations in India show that in some parts of the Himalayas the glaciers are re-appearing. These are said to be in North America and even in the southern hemisphere (Nature, January 2, 1908, p. 201).

 Movement.—The fact that a glacier moves is easily demonstrated; the cause of the movement is pressure upon a yielding mass; the nature of the movement is still under discussion. Rows of stakes or stones placed in line across a glacier are found to be carried away by the glacier or to be thrown down by the bank, and also with regard to each other. The posts in the centre of the ice-stream gradually move away from those at the side, proving that the centre moves faster than the sides. It has also been proved that the surface portions move more rapidly than the deeper layers and that the motion is slowest at the sides and bottom where friction is greatest.
GLACIER

The rate of motion past the same spot is not uniform. Heat accelerates it, cold arrests it, and the pressure of a large amount of water stimulates the flow. The rate of flow under the same conditions varies at different parts of the glacier directly as the thickness of ice, the steepness of slope and the smoothness of rocky floor. Generally speaking, the rate of motion depends upon the amount of ice that forms upon the shelf of the floor, the nature of the floor, the temperature and the amount of water present in the ice. The ordinary rate of motion is very slow. In Switzerland it is from 1 to 2 in. 10 to 4 ft. per day, in Alaska 7 ft., in Greenland 50 to 60 ft., and occasionally 100 ft. per day in the height of summer under exceptional conditions of quantity of ice and of water and slope. Measurements of Swiss glaciers show that near the ice foot where wastage is greatest there is very little movement, and observations upon the inland border of Greenland ice show that it is almost stationary over long distances.

In many aspects the motion of a body of ice resembles that of a body of water, and an alpine glacier is often called an ice-river, since like a river it moves faster in the centre than at the sides and at the top faster than at the bottom. A glacier follows a curve in the same way as a river, and there appear to be ice swirls and eddies as well as an upward creep on shelving curves recalling many features of stream action. The rate of motion of both ice-stream and river is accelerated by quantity and steepness of slope and retarded by roughness of bed, but here the comparison ends, for temperature does not affect the rate of water motion, nor will a liquid crack into crevasses as a glacier does, or move upwards over an adverse slope as a glacier always does when there is sufficient "head" of ice above it. So that although in many respects ice behaves as a viscous fluid the comparison with such a fluid is not perfect. The cause of glacier motion must be based upon some more or less complex considerations. The flakes of snow are gradually transformed into granules because the points and angles of the original flakes melt with the greater readiness than the more rounded portions, which become aggregated round some master flake that continues to grow in the névé at the expense of its smaller neighbours, and increases in size until finally the glacier ice is composed of a mass of interlocked crystalline granules, some as large as a walnut, closely compacted under pressure with the principal crystalline axes in various directions. In the upper portions of the glacier movement due to pressure probably takes place by the gliding of one granule over another. In this connexion it is believed that pressure lowers the melting point of ice while tension raises it, and at all points of pressure there is therefore a tendency to momentary melting, and also to some evaporation due to the heat caused by pressure, and at the intermediate tension spaces between the points of pressure this resultant liquid and vapour will be at once re-frozen and become solid. The granular movement is thus greatly facilitated, while the body of ice remains in a crystalline solid condition. In this connexion it is well to remember that the pressure of the glacier upon its floor will have the same result, but the effect here is a mass-effect and facilitates the gliding of the ice over obstacles, since the friction produces heat and the pressure lowers the melting point, so that the two causes tend to liquefy the portion where pressure is greatest and so to " lubricate " the prominences and enable the glacier to slide more easily over them, while the liquid thus produced is re-frozen when the pressure is removed.

In polar regions of very low temperature a very considerable amount of pressure must be necessary before the ice granules yield to momentary liquefaction at the points of pressure, and this probably accounts for the great flatness of the Arctic and Antarctic ice-caps where the slopes are moderate, for although equally low temperatures are found in high Alpine snow-fields the slopes there are exceedingly steep and motion is therefore more easily produced.

Observations made upon the Greenland glaciers indicate a considerable amount of "shearing" movement in the lower portions of a glacier. Where obstacles in the bed of the glacier arrest the movement of the ice immediately above it, or where the lower portion of the glacier is choked by débris, the upper ice glides over the lower in shearing planes that are sometimes strongly marked by débris caught and pushed forwards along these planes of foliation. It must be remembered that there will be a push from behind upon the lower portion of a glacier quite different from the pressure of a body of water upon any point, for the pressure of a fluid is equal in all directions, and also that this push will tend to set the crystalline granules in positions in which their crystalline axes are parallel along the gliding planes. The production of gliding planes is in some cases facilitated by the descent into the glacier of water melted during summer, where it expands in freezing and pushes the adjacent ice away from it, forming a surface along which movement is readily established.

If under all circumstances the glacier melted under pressure at the bottom, glacial abrasion would be nearly impossible, since every small stone and fragment of rock would rotate in a liquid shell as the ice moved forward, but since the pressure is not always sufficient to produce melting, the glacier sometimes remains dry at its base; rock fragments are held firmly; and a dry glacier may thus become a grinding tool of enormous power. Whatever views may be adopted as to the causes of glacier motion, the peculiar character of glacier ice as distinct from homogeneous river or pond ice must be kept in view, as well as the characteristic tendency of water to expand in freezing, the lowering of the melting point of ice under pressure, the raising of the melting point under tension, the production of gliding or shearing planes under pressure from above, the presence in summer of a considerable quantity of water in the lower portions of the glacier which are thus loosened, the cracking of ice (as into crevasses), under sudden strain, and the regulation of ice in contact. A result of this last process is that fissures are not permanent, but having been produced by the passage of ice over an obstruction, they subsequently become healed when the ice descends upon that obstruction in a flatter bed... Finally it must be remembered that although glacier ice behaves in some sense like a viscous fluid its condition is totally different, since "a glacier is a crystalline rock of the purest and simplest type, and it never has other than the crystalline state."

Characteristics.—The general appearance of a glacier varies according to its environment of position and temperature. The upper portion is hidden by néeve and often by freshly fallen snow, and is smooth and unbroken. During the summer, when little snow falls, the body of the glacier moves away from the snow-field and a glacial crevasse of great depth is usually established called the bergschrund, which is sometimes taken as the upper limit of the glacier. The glacier as it moves down the valley may become "loaded" in various ways. Rock-falls send periodical showers of stones upon it from the heights, and these are spread out into long lines at the glacier sides as the ice moves downwards carrying the rock fragments with it. These are the "lateral moraines." When two or more glaciers descending adjacent valleys converge into one glacier one or more sides of the higher valleys disappear, and the ice that was contained in several valleys is now carried by one. In the simplest case where two valleys converge into one the two inner lateral moraines meet and continue to stream down the larger valley as one "median moraine." Where several valleys meet there are several such parallel median moraines, and so long as the ice remains unbroken these will be carried upon the surface of the glacier and finally tipped over the end. There is, however, differential heating of rock and ice, and if the stones carried are thin they tend to sink into the ice because they absorb heat readily and melt the ice under them. Dust has the same effect and produces "dust wells" that honeycomb the upper surface of the ice with holes into which the dust sinks. If the moraine rocks are thick they prevent the ice under them from melting in sunlight, and isolated blocks often remain supported upon ice-pillars in the form of ice tables, which finally collapse, so that such rocks may be scattered out of the line of the moraine. As the glacier descends into
the lower valleys it is more strongly heated, and surface streams are established in consequence that flow into channels caused by unequal melting of the ice and finally plunge into crevasses. These crevasses are formed by strains established as the central parts drag away from the sides of the glacier and the upper surface from the lower, and more markedly by the tension due to a sudden bend in the glacier caused by an inequality in ground temperature being over-ridden. These crevasses are developed at right angles to the strain and often produce intersecting fissures in several directions. The morainic material is gradually dispersed by the inequalities produced, and is further distributed by the action of superficial streams until the whole surface is strewn with stones and débris, and presents, as in the lower portions of the Mer de Glace, an exceedingly dirty appearance. Many blocks of stone fall into the gaping crevasses and much loose rock is carried down as "englacial material" in the body of the glacier. Some of it reaches the bottom and becomes part of the "ground moraine" which underlies the glacier, at least from the bergschlund to the "snout," where much of it is carried away by the issuing stream and spread finally on to the plains below. It appears that a very considerable amount of degradation is caused under the bergschlund by the mass of ice "plucking" and dragging great blocks of rock from the side of the mountain valley where the great head of ice rests in winter and whence it begins to move in summer. These blocks and many smaller fragments are carried down into the bergschlund and cause powerful abrasion upon the rocky floor, rasping and scoring the channel, producing conspicuous striae, polishing and rounding the rock surfaces, and grinding the contained fragments as well as the surface over which it passes into small fragments and fine powder, from which "boulder clay" or "tilt" is finally produced. Emerging, then, from the snow-field as pure granular ice the glacier gradually becomes strewn and filled with foreign material, not only from above but also, as is very evident in some Greenland glaciers, occasionally from below by masses of fragments that move upwards along gliding planes, or are forced upwards by slow swells in the ice itself.

As a glacier is a very brittle body any abrupt change in gradient will produce a number of crevasses, and these, together with those produced by dragging strains, will frequently wedge the glacier into a mass of pinnacles or stress that may be partially healed but are usually evident when the melting end of the glacier emerges suddenly from a steep valley. Here the streams widen the weaker portions and the moraine rocks fall from the end to produce the "terminal" moraine, which usually lies in a crescentic heap encircling the glacier snout, when it can only be moved by a further advance of the glacier or by the ordinary slow process of atmospheric denudation.

In cases where no rock falls upon the surface there is a considerable amount of englacial material due to upturning either over accumulated ground débris or over structural inequalities in the rock floor. This is well seen at the steep sides and ends of Greenland glaciers, where material frequently comes to the surface of the melting ice and produces median and lateral moraines, besides appearing in enormous "eyes" surrounded in the glacial body by contorted and foliated ice and sometimes producing heaps and embankments as it is pushed out at the end of the melting ice.

The environment of temperature requires consideration. At the upper or dossal portion of the glacier there is a zone of variable (winter and summer) temperature, beneath which, if the ice is thick enough, there is a zone of constant temperature which will be about the mean annual temperature of the region of the snow-field. Underlying this there is a more or less constant vertical ground temperature, depending mainly upon the internal heat of the earth, which is conducted to the under surface of the glacier where it slowly melts the ice, the more readily because the pressure lowers the melting point considerably, so that streams of water run constantly from beneath many glaciers, adding their volume to the springs which issue from the rock. The middle zone of constant temperature is wedge-shaped in "alpine" glaciers, the apex pointing downwards to the zone of waste. The upper zone of variable temperature is thinnest in the snow-field where the mean temperature is lowest, and entirely dominant in the snout end of the glacier where the zone of constant temperature disappears. Two temperature wedges are thus superposed base to point, the one being thickest where the other is thinnest, and both these lie upon the basal film of temperature where the escaping earth-heat is strengthened by that due to friction and pressure. The cold wave of winter may pass right through a thin glacier, or the constant temperature may be too low to permit of the ice melting at the base, in which cases the glacier is "dry" and has great eroding power. But in the lower warmer portions water running through crevasses will raise the temperature, and increase the strength of the downward heat wave, while the mean annual temperature being there higher, the combined result will be that the glacier will gradually become "wet" at the base and have little eroding power, and it will become more and more wet as it moves down the lower valley zone of ice-waste, until at last the balance is reached between waste and supply and the glacier finally disappears.

If the mean annual temperature be 20 °F, and the mean winter temperature be -12 °F, as in parts of Greenland, all the ice must be considerably below the melting point, since the pressure of ice a mile in depth lowers the melting point only to 30 °F, and the earth-heat is only sufficient to melt ⅛ in. of ice in a year. Therefore in these regions, and in snow-fields and high glaciers with an equal or lower mean temperature than 20 °F, the glacier will be "dry" throughout, which may account for the great eroding power stated to exist near the bergschlund in glaciers of an alpine type, which usually have their origin on precipitous slopes.

A considerable amount of ice-waste takes place by water-drainage, though much is the result of constant evaporation from the ice surface. The lower end of a glacier is in summer flooded by streams of water that pour along cracks and plunge into crevasses, often forming "pot-holes" or moulins where stones are swirled round in a glacial "mill" and wear holes in the solid rock below. Some of these streams issue in a spout half way up the glacier's end wall, but the majority find their way through it and join the water running along the glacier floor and emerging where the glacier ends in a large glacial stream.

Results of Glacial Action.—A glacier is a degrading and an aggregating agent. Much difference of opinion exists as to the potency of a glacier to alter surface features, some maintaining that it is extraordinarily effective, while others believe that a glacier forms a pronounced cirque at the region of its origin and that the cirque is gradually cut backward until a long and deep valley is formed (which becomes evident, as in the Rocky Mountains, in an upper valley with "reversed grade" when the glacier disappears), and also that the end of a glacier plunging into a valley or a fjord will gouge a deep basin at its region of impact. The Alaskan and Norwegian fjords and the rock basins of the Scottish lochs are adduced as examples. Other writers maintain that a glacier is only a modifying and not a dominant agent in its effects upon the land-surface, considering, for example, that a glacier coming down a lateral valley will preserve the valley from the atmospheric denudation which has produced the main valley over which the lateral valley "hangs," a result which the believers in strong glacial action hold to be due to the more powerful action of the main glacier as contrasted with the weaker action of that in the lateral valley. Both the advocates and the opponents of strenuous ice action agree that a V-shaped stream erosion is converted to a U-shaped valley of glacial modification, and that rock surfaces are rounded into roches moutonées, and are grooved and striated by the passage of ice shed with fragments of rock, while the subglacial material is ground into finer and finer fragments until it becomes mud and "rock-flour" as the glacier proceeds. In any case striking results are manifest in any formerly glaciated region. The high peaks rise into pinnacles, and ridges with "house-roof" structure,
above the former glacier, while below it the contours are all rounded and typically subdued. A landscape that was formerly completely covered by a moving ice-cap has none but these rounded features of dome-shaped hills and U-shaped valleys that at least bear evidence to the great modifying power that a glacier has upon a landscape.

There is no conflict of opinion with regard to glacial aggradation and the distribution of superglacial, englacial and subglacial material, which during the active existence of a glacier is finally distributed by glacial streams that produce very considerable alluviation. In many regions which were covered by the Pleistocene ice-sheet the work of the glacier was arrested by melting before it was half done. Great deposits of till and boulder clay that lay beneath the glaciers were abandoned in situ, and remain as an unsorted mixture of large boulders, pebbles and mingled fragments, embedded in clay or sand. The lateral, median and terminal moraines were stranded where they sank as the ice disappeared, and together with perched blocks (roches perches) remain as a permanent record of former conditions which are now found to have existed temporarily in much earlier geological times. In glaciated North America lateral moraines are found that are 500 to 1000 ft. high and in northern Italy 1500 to 2000 ft. high. The surface of the ground in all these places is modified into the characteristic glaciated landscape, and many formerly deep valleys are choked with glacial debris either completely changing the local drainage systems, or compelling the reappearing streams to cut new channels in a superposed drainage system. In such areas also and eskers (q.v.) are left under certain conditions, with many puzzling deposits that are clearly due to some features of ice-work not thoroughly understood.

GLACIS, in military engineering (see FORTIFICATION and SIEGECRAT), an artificial slope of earth in the front of works, so constructed as to keep an assailant under the fire of the defenders to the last possible moment. On the natural ground-level, troops attacking any high work would be sheltered from its fire when close up to it; the ground therefore is raised to form a glacis, which is swept by the fire of the parapet. More generally, the term is used to denote any slope, natural or artificial, which ascends from the parapet towards the glacis. In the last respect the term is also used to denote a glacis or sloping ground of 15 or 20°, which with a parapet 3 ft. high is sufficient to cover the parapet and the first 5 ft. of the glacis. (J. & P. Dict.)

GLADISCH-Gladbach, the name of two towns in Germany distinguished as Bergisch-Gladbach and München-Gladbach.

1. BERGISCH-Gladbach is in Rhenish Prussia, 8 m. N.E. of Cologne by rail. Pop. (1905) 13,410. It possesses four large paper mills and among its other industries are paste-board, powder, percussion caps, nets and machinery. Ironstone, peat and lime are found in the vicinity. The town has four Roman Catholic churches and one Protestant. The Stundelshöhle, a popular resort, is in the neighbourhood, and near Gladbach is the church of St. Hedwig with a remarkably fine church, built for the Cistercian abbey at this place.

2. MÜNCHEN-Gladbach, also in Rhenish Prussia, 16 m. W.S.W. of Düsseldorf on the main line of railway to Aix-la-Chapelle. Pop. (1885) 44,230; (1905) 66,714. It is one of the chief manufacturing places in Rhenish Prussia, its principal industries being the spinning and weaving of cotton, the manufacture of silks, velvet, ribbon and damasks, and dyeing and bleaching. There are also tanneries, tobacco manufactures, machine works and foundries. The town possesses a fine fire station and has statues of the emperor William I. and of Prince Bismarck. There are ten Roman Catholic churches here, among them being the beautiful minster, with a Gothic choir dating from 1250, a nave dating from the beginning of the 13th century and a crypt of the 8th century. The town has two hospitals, several schools, and is the headquarters of important insurance societies.

Gladbach existed before the time of Charlemagne, and a Bene- dictine monastery was founded near it in 793. It was thus called München-Gladbach or Monks' Gladbach, to distinguish it from another town of the same name. The monastery was suppressed in 1802. It became a town in 1336; weaving was introduced here towards the end of the 18th century, and having belonged for a long time to the duchy of Juliers it came into the possession of Prussia in 1815.

See Strauss, Geschichte der Stadt München-Gladbach (1895); and G. Eckertz, Das Verbrüderungs- und Todtenbuch der Abtei Bredel (1881).

GLADDEN, WASHINGTON (1836— ), American Congregational divine, was born in Pottsgrove, Pennsylvania, on the 11th of February 1836. He graduated at Williams College in 1859, and was ordained in Brooklyn, Morrisania (New York City), North Adams, Massachusetts, and Springfield, Massachusetts, and in 1882 became pastor of the First Congregational Church of Columbus, Ohio. He was an editor of the Independent in 1871-1875, and a frequent contributor to it and other periodicals. He consistently and earnestly urged in pulpit and press the need of personal, civil, and particularly, social righteousness, and in 1900-1902 was a member of the city council of Columbus. Among his many publications, which include sermons, occasional addresses, &c., are: Plain Thoughts on the Art of Living (1868); Workingmen and their Employers (1870); The Christian Way (1877); Things New and Old (1884); Applied Christianity (1887); Tools and the Masons Properly and Industry under the Christian Law (1890); The Church and the Kingdom (1894), arguing against a confusion and misuse of these two terms; Seven Puzzling Bible Books (1897); How much is Left of the Old Doctrines (1899); Social Salvation (1901); Witnesses of the Light (1903); the William Belden Noble Lectures (Harvard), being addresses on Dante, Michelangelo, Fichte, Hugo, Wagner and Ruskin; The New Idolatry (1903); Christianity and Socialism (1906), and The Church and Modern Life (1908). In 1909 he published his Recollections.

GLADIATORS (from Latin gladius, sword), professional combatants who fought to the death in Roman public shows. That this form of spectacle, which is almost peculiar to Rome and the Roman provinces, was originally borrowed from Etruria is shown by various indications. On an Etruscan tomb discovered at Tarquinii there is a representation of gladiatorial games; the slaves employed to carry off the dead bodies from the arena wore masks representing the Etruscan Charon; and we learn from Isidore of Seville (Origines, x.) that the name for a trainer of gladiators (funtista) is an Etruscan word meaning butcher or executioner. These gladiatorial games are evidently a survival of the practice of immolating slaves and prisoners on the tombs of illustrious chieftains, a practice recorded in Greek, Roman and Scandinavian legends, and traceable even as late as the 19th century as the Indian sutter. Even at Rome they were for a long time confined to funerals, and hence the older name for gladiators was bustaurii; but in the later days of the republic their original significance was forgotten, and they formed as indispensable a part of the public amusements as the theatre and the circus.

The first gladiators are said, on the authority of Valerius Maximus (iii. 4. 7), to have been exhibited at Rome in the Forum Boarium in 264 B.C. by Marcus and Decimus Brutus at the funeral of their father. On this occasion only three pairs fought, but the taste for these games spread rapidly, and the number of combatants grew apace. In 174 Titus Flaminius celebrated his father's obsequies by a three-days' fight, in which 74 gladiators took part. Julius Caesar engaged such extravagant numbers for his sledgework that his political opponents took fright and carried a decree of the senate imposing a certain limit of numbers, but notwithstanding this restriction he was able to exhibit no less than 300 pairs. During the later days of the republic the gladiators were a constant element of danger to the public peace. The more turbulent spirits among the nobility had each his band of gladiators to act as a bodyguard, and the armed troops of Clodius, Milo and Catiline played the same part.
GLADIATORS

in Roman history as the armed retainers of the feudal barons or the condottieri of the Italian republics. Under the empire, notwithstanding sumptuary enactments, the passion for the arena steadily increased. Augustus, indeed, limited the shows to two a year, and forbade a praetor to exhibit more than 120 gladiators, yet allusions in Horace, Sat. ii. 3, 85, 86, and Persius (v. 45), the Visigoths to ostentation and the fashionable number for private entertainments; and in the Marmor Anconyrum the emperor states that more than 10,000 men had fought during his reign. The imbecile Claudius was devoted to this pastime, and would sit from morning till night in his chair of state, descending now and then to the arena to coax or force the reluctant gladiators to resume their bloody work. Under Nero senators and even well-born women appeared as combatants; and Juvenal (viii. 150) has handed down to eternal infamy the disdainer of the Gracchi who appeared without disguise as a retiarius, and begged his life from the secutor, who blushed to conquer one so noble and so vile. Titus, whom his countrymen surnamed the Clemency, ordered a show which lasted 100 days; and Trajan, in celebration of his triumph over Decebalus, exhibited 5000 pairs of gladiators. Domitian at the Saturnalia of A.D. 90 arranged a battle between dwarfs and women. Even women of high birth fought in the arena, and it was not till A.D. 200 that the practice was forbidden by edict. How widely the taste for these sanguinary spectacles extended throughout the Roman provinces is attested by monuments, inscriptions, and the remains of vast amphitheatres. From Britain to Syria there was not a town of any size that could not boast its arena and annual games. After Italy, Gaul, North Africa and Spain were most famous for their amphitheatres; and Greece was the only Roman province where the institution never thoroughly took root.

Gladiators were commonly drawn either from prisoners of war, or slaves or criminals condemned to death. Thus in the first half of the 4th century we read of tattooed Britons in their war chariots, Thracians with their peculiar bucklers and scimitars, Moors from the villages round Atlas and negroes from central Africa, exhibited in the Colosseum. Down to the time of the empire only greater malefactors, such as brigands and incendiaries, were condemned to the arena; but by Caligula, Claudius and Nero this punishment was extended to minor offences, such as fraud and peculation, in order to supply the growing demand for victims. For the first century of the empire it was lawful for masters to sell their slaves as gladiators, but this was forbidden by Hadrian and Marcus Aurelius. Besides these three regular classes, the ranks were recruited by a considerable number of freedmen and Roman citizens who had squandered their estates and voluntarily took the auctoramentum gladiatorum, by which for a stated time they bound themselves to the lanista. Even men of birth and fortune not seldom entered the lists, either for the pure love of fighting or to gratify the whim of some dissolute emperor; and one emperor, Commodus, actually appeared in person in the arena.

Gladiators were trained in schools (ludi) owned either by the state or by private citizens, and though the trade of a lanista was considered disgraceful, to own gladiators and let them out for hire was reckoned a legitimate branch of commerce. Thus Cicero, in his letters to Atticus, congratulates his friend on the good bargain he had made in purchasing a band, and urges that he might easily recoup himself by consenting to let them out twice. Men recruited mainly from slaves and criminals, whose lives hung on a thread, must have been more dangerous characters than modern gallery slaves or convicts; and, though habitually the more brutal ended the more of necessity ended in an iron discipline. In the school of gladiators discovered at Pompeii, of the sixty-three skeletons buried in the cells many were in irons. But hard as was the gladiators’ lot,—so hard that special precautions had to be taken to prevent suicide,—it had its consolations. A successful gladiator enjoyed far greater fame than any modern prize-fighter or athlete. He was

1 See A. E. Housman on the passage in Classical Review (November 1904).

presented with broad pieces, chains and jewelled helmets, such as may be seen in the museum at Naples; poets like Martial sang his prowess; his portrait was multiplied on vases, lamps and gems; and high-born ladies contended for his favours. Mixed, too, with the lowest dregs of the city, there must have been in the mere gladiator a noble barbarians condemned to the vile trade by the hard fate of war. These were few in number. Characters in Roman history than the Thracian Spartacus, who, escaping with seventy of his comrades from the school of Lentulus at Capua, for three years defied the legions of Rome; and after Antony’s defeat at Actium, the only part of his army that remained faithful to his cause were the gladiators whom he had enrolled at Cyzicus to grace his anticipated victory.

There were various classes of gladiators, distinguished by their arms or modes of fighting. The Samnites fought with the national weapons—a large oblong shield, a visor, a plumed helmet and a short sword. The Thracians had a small round buckler and a dagger curved like a scythe; they were generally pitted against the Mirmillones, who were armed in Gallic fashion with helmet, sword and shield, and were so called from the fish (μούραδος or μούραπος) which served as the crest of their helmet. In like manner the Retiarius was matched with the Secutor: the former had nothing on but a short tunic or apron, and sought to entangle his pursuer, who was fully armed, with the cast-net (jaculum) that he carried in his right hand; and if successful, he despatched him with the trident (tridentes, focasta) that he carried in his left. We may also mention the Andabatae who are generally believed to have fought on horseback and wore helmets with closed visors; the Dimachai of the later empire, who carried a short sword in each hand; the Essedarii, who fought from chariots like the ancient Britons; the Hoplomachi, who wore a complete suit of armour; and the Laucarui, who tried to lasso their antagonists.

Gladiators also received special names according to the time and circumstances in which they exercised their calling. The Bystaurii have already been mentioned; the Catuvaei fought, not in pairs, but in bands; the Meridiani came foremost in the middle of the day for the entertainment of those spectators who had not left their seats; the Ordinarii fought only in pairs, in the regular way; the Fiscales were trained and supported at the expense of the imperial treasury; the Paenitarii used harmless weapons, and their exhibition was a sham one; the Postulaticii were those whose appearance was asked as a favour from the giver of the show, in addition to those already exhibited. The shows were announced some days before they took place by bills affixed to the walls of houses and public buildings, copies of which were also sold in the streets. These bills gave the names of the chief pairs of competitors, the date of the show, the name of the giver and the different kinds of combat. The spectacle began with a procession of the gladiators through the arena, after which their swords were examined by the giver of the show. The proceedings opened with a sham fight (proslasio, prolaisio) with wooden swords and javelins. The signal for real fighting was given by the sound of the trumpet, those who showed fear being driven on to the arena with whips and red-hot irons. When a gladiator was wounded, the spectators shouted Habet (he is wounded); if he was at the mercy of his adversary, he lifted up his forefinger to implore the clemency of the people, with whom (in the later times of the republic) the giver left the decision as to his life or death. If the spectators were in favour of mercy, they waved their handkerchiefs; if they desired the death of the conquered gladiator, they turned their thumbs downwards. The reward of victory consisted of branches of laurel, but there are few fakers who did not exercise their calling for a long time, or such as displayed special skill and bravery, were presented with a wooden sword (ridiis), and discharged from further service.
Both the estimation in which gladiatorial games were held by Roman moralists, and the influence that they exercised upon the morals and genius of the nation, deserve notice. The Roman was essentially a sensualist from a natural and crude appreciation of sadism, cruelty, and callousness and defective sympathies. This element of inhumanity and brutality must have been deeply ingrained in the national character, and the games were very popular. We may be no doubt that it was fed and fostered by the savage form which their amusements took. That the sight of bloodshed provoked a love of bloodshed and cruelty is a commonplace of morals. To the Romans, the sight of cruelty may have at least in part, not only the brutal treatment of their slaves and prisoners, but the frequency of suicide among the Romans. On the other hand, we should be careful not to overinterpret the effects or draw too sweeping of the prevalence of the degradation. Human nature is happily illogical; and we know that many of the Roman statesmen who gave these games, and themselves enjoyed these sights of cruelty, were afterwards very energetic in the repression of the indulgent fathers, humane generals and mild rulers of provinces. In the present state of society it is difficult to conceive how a man of taste can have endured to gaze upon a scene of human butchery. Yet we should remember that it is not so long since bear-baiting was prohibited in England, and we are only now attaining that stage of morality in respect of cruelty to animals that was reached in the 5th century, by the help of Christianity, in respect of cruelty to men. We shall not then be greatly surprised if hardly one of the Roman moralists is found to raise his voice against this amusement, except on the score of extravagance. Cicero in a well-known passage commends the gladiatorial games as the best way to prevent the waste of time, the loss of life, and the degeneracy of the people. Aurelius, though he did much to mitigate their horrors, yet in his writings condemns the monstrosity rather than the cruelty. Seneca is indeed a splendid exception, and his letter to Lentulus is an eloquent appeal for its abolition. But it is outside of this parallel that we turn to the writings of the Christian fathers. Tertullian, Lactantius, Cyprian and Augustine. In the Confessions of St. Augustine, of the occurrence which is worth quoting as an illustration of the strange fascination which the games exercised even on a religious man and a Christian. He tells us how his friend Alipius was dragged against his will to the amphitheatre, how he strove to escape at first, but was forced to witness the sufferings of those around him, and how at some point the sight of the whole assembly aroused his curiosity, how he looked and was lost, grew drunk with the sight of blood, and returned again and again, knowing its evil yet unable to abstain. The first Christian emperor was persuaded to issue an edict abolishing gladiatorial games (325), yet in 404 we read of an exhibition of gladiators to celebrate the triumph of Honorious over the Goths, and it is said that they were not totally extinct in the West till the time of Theodoric.

Gladiators formed admirable models for the sculptor. One of the finest remains of ancient sculpture is to be found in the so-called "Wounded Gladiator" of the National Museum at Naples. The so-called "Fighting Gladiator" of the Borghese collection, now in the Museum of the Louvre, and the "Dying Gladiator" of the Capitoline Museum are works which have been praised by the famous Lactantius, have been pronounced by modern antiquaries to represent, not gladiators, but warriors. In connexion with this we may mention the admirable picture of a gladiator by Gérome which bears the title, "Ave, Caesar, morituru te salutamus." The attention of archaeologists has been recently directed to the tesserae of gladiators. These tesserae, of which about sixty exist in various museums, are small oblong tablets of ivory or bone, with an inscription on each of the four sides. The first line contains a name in the nominative case, presumably that of the gladiator; the second line a name in the genitive, that of the patronus or dominus; the third line begins with the letters SP (for spes—approved), which shows that the gladiator had passed his preliminary trials; this is followed by a day of a Roman month; and in the fourth line is the place of the battle. Their importance is great, for many of them bear inscriptions, and a few present a case for study.

AUTHORITIES.—All needful information on the subject will be found in L. Friedländer's Darstellungen aus der Sittengeschichte Roms (part i., 5th ed., 1886), and in the section by him on "The Games" in F. W. Dittenberger's Dictionnaire des antiquités. See also F. W. Ritschl, Tesserae gladiatoriae (1864) and his Monographie der Gladiatoren (1874). The best work on the subject is L. C. de Pauw's Les gladiateurs (Leipzig, 1867). The articles by Lipsius on the Saturnalia and amphitheatrum in Graecius, Thesaurus antiquitatum Romanarum, ix., may still be consulted with advantage.

GLADIOLUS, a genus of monocotyledonous plants, belonging to the natural order Iridaceae. They are herbaceous plants growing from a solid fibrous-coated bulb (or corm), with long narrow slit leaves and a terminal one-sided spike of generally bright-coloured irregular flowers. The segments of the limb of the perianth are very unequal, the perianth tube is curved, funnel-shaped and widening upwards, the segments equaling or exceeding the tube in length. There are about 150 known species, a large number of which are South African, but the genus extends into tropical Africa, forming a characteristic feature of the mountain vegetation, and as far north as central Europe and western Asia. One species G. illyricus (sometimes regarded as a variety of G. communis) is found wild in England, in the New Forest and the Isle of Wight. Some of the species have been cultivated for a long period in English flower-gardens, where both the introduced species and the modern varieties bred from them are very ornamental and popular. G. segetum has been cultivated since 1596, and G. byzantinus since 1629, while many additional species were introduced during the latter half of the 18th century. One of the earliest of the hybrids originated in gardens was the beautiful G. Colvillei, raised in the nursery of Mr Colville of Chelsea in 1833 from G. tritis fertilized by G. cardinalis. In the first decade of the 19th century, however, the Hon. and Rev. W. Herbert had successfully crossed the showy G. cardinalis with the smaller but more free-flowering G. blundus, and the result was the production of a race of great beauty and fertility. Other crosses were made with G. tritis, G. oppositifolius, G. hirsutus, G. alatus and G. psittacinus; but it was not till after the production of G. gandavensis that the gladiolus really became a general favourite in gardens. This fine hybrid was raised in 1837 by M. Bedinghaus, gardener to the duc d'Aremberg, at Enghien, crossing G. psittacinus and G. cardinalis. There can, however, be little doubt that before G. gandavensis type was evolved, with pollen from G. gandavensis, other species were brought into force, and the most likely of these were G. oppositifolius (which shows in the white forms), G. blundus and G. ramosus. Other species may also have been used, but in any case the gandavensis gladiolus, as we now know it, is the result of much crossing and inter-crossing between the best forms as they developed (J. Weathers, Practical Guide to Garden Plants). Since that time innumerable varieties have appeared only to sink into oblivion upon being replaced by still finer productions.

The modern varieties of gladioli have almost completely driven the natural species out of gardens, except in botanical collections. The most gorgeous groups—in addition to the gandavensis type—are those known under the names of Lemoinei, Childsi, nanceianus and brenchleyensis. The last-named was raised by a Mr Hooker at Brenchley in 1848, and although quite distinct in appearance from gandavensis, it undoubtedly had that variety as one of its parents. Owing to the brilliant scarlet coloration of the flowers, this is always a great favourite for planting in beds. The Lemoinei are believed to have originated at Nancy, in France, by fertilizing G. purpureo-aureus with pollen from G. gandavensis, the first flower appearing in 1877, and the plants being put into commerce in 1885. The Childsi gladioli first appeared in 1882, having been raised at Baden-Baden by Herr Max Leichtlin from the best forms of G. gandavensis and G. Saundersii. The flowers of the best varieties are of great size and substance, often measuring 7 to 9 in. across, while the range of colour is marvellous, with shades of grey, purple, scarlet, salmon, crimson, rose, white, pink, yellow, &c., often beautifully mottled and blotched in the throats. The flowers in the Lemoinei have been raised with much success, reaching a height of 4 ft. The nanceianus was raised at Nancy by MM. Lemoine and were first put into commerce in 1889. Next to the Childsi group they are the most beautiful, and have the blood of the best forms of G. Saundersii and G. Lemoinei in their veins. The plants are quite as hardy as the gandavensis hybrids, and the colours of the flowers are almost as brilliant and varied in hue as those of the Childsi section.

A deep and rather stiff sandy loam is the best soil for the gladioli, and this should be trenched up in October and enriched with well-decomposed manure, consisting partly of cow dung, the manure being disposed altogether below the corms, a layer of the upper trench, say 9 in. from the surface, and another layer at double that depth. The corms should be planted in succession at intervals of about three weeks through the months of March, April and May; about 3 to 5 in. deep and at least 1 ft. apart, a little pure soil or sand being laid over each before the earth is closed in about them, an
arrangement which may be advantageously followed with bulbous plants generally. In hot summer weather they should have a good mulching of well-decayed manure, and, as soon as the flower spikes are produced, liquid manure may occasionally be given them with advantage.

The glad shouts is easily raised from seeds, which should be sown in March or April in pots of rich soil placed in slight heat, the pots being kept near the glass after they begin to grow, and the plants being gradually hardened to permit their being placed out-of-doors in a sheltered spot for the summer. Modern growers often grow the seeds in the open in April on a nicely prepared bed in drills about ½ inch deep, covering them with finely sifted gritty mould. The seed bed is then pressed down evenly and firmly, watered occasionally and kept free from weeds during the summer. In October they will have ripened oil, and must be taken out of the soil, and stored in a dry place to secure from rotting. They will have made little bulbs from the size of a hazel nut downwards, according to their vigour. In the spring they should be planted like bulbs, 2 inches deep, while the smaller ones must be again harvested and planted out as before. The time occupied from the sowing of the seed until the plant attains its full strength is from three to four years. The approved sorts, which are identified by name, are usually raised by means of bulblets or offsets or "spawn," which form around the principal bulb or corn; but in this they vary greatly, some kinds furnishing ample and instant increase and others becoming planted while others persistently refuse to yield offsets. The stately habit and rich glowing colours of the modern gladlioni render them exceedingly valuable as decorative plants during the late summer months. They are used in the nursery trade and useful for decoration for the purpose of decoration, for while the blossoms themselves last fresh for some days if cut either in the morning or late in the evening, the undeveloped buds grow and remain in perfect condition, if they are kept in water, so that a cut spike will go on blooming for some time.

GLADSTONE (Old Norse Gladheimr), in Scandinavian mythology, the region of joy and home of Odin. Valhalla, the paradise wherein the heroes who fell in battle were escorted, was situated there.

GLADSTONE, JOHN HALL (1827-1900), English chemist, was born at Hackney, London, on the 7th of March 1827. From childhood he showed great aptitude for science; geology was his favourite subject, but since this in his father's opinion did not afford a career of promise, he devoted himself to chemistry, which he studied under Thomas Graham at University College, London, and Liebig at Giessen, where he graduated as Ph.D. in 1847. In 1850 he became chemical lecturer at St. Thomas's hospital, and three years later was elected a fellow of the Royal Society at the unusually early age of twenty-six. From 1858 to 1861 he served on the royal commission on lighthouses, and from 1864 to 1868 he was a member of the war office committee on gun-cotton. From 1874 to 1877 he was Fullerton professor of chemistry at the Royal Institution, in 1874 he was chosen first president of the Physical Society, and in 1877-1879 he was president of the Chemical Society. In 1897 the Royal Society recognized his fifty years of scientific work by awarding him the Davy medal. Dr. Gladstone's researches were large in number and wide in range, dealing to a great extent with problems that lie on the border-line between physics and chemistry. Thus a number of his inquiries, and those not the least important, were partly chemical, partly optical. He determined the optical constants of hundreds of substances, with the object of discovering whether any of the elements possesses more than one atomic refraction. Again, he investigated the connexion between the optical behaviour, density and chemical composition of eetheral oils, and the relation between molecular magnetic rotation and the refraction and dispersion of nitrogenous compounds. So early as 1856 he showed the importance of the spectroscope in chemical research, and he was one of the first to notice that the Fraunhofer spectrum at sunrise and sunset differs from that at midday, his conclusion being that the earth's atmosphere must be responsible for many of its absorption lines, which indeed were subsequently traced to the oxygen and water-vapour in the air. Another portion of his work was of an electro-chemical character. His studies, with Alfred Tribe (1840-1885) and W. Hibbert, in the electricity of the soil, have been largely to our knowledge, while the "copper-zinc couple," with which his name is associated together with that of Tribe, among other things, afforded a simple means of preparing certain organo-metallic compounds, and thus promoted research in branches of organic chemistry where those bodies are especially useful. Mention of his work on phosphorus on explosive substances, such as iodide of nitrogen, gun-cotton and the fulminates, on the influence of mass in the process of chemical reactions, and on the effect of carbonic acid on the germination of plants. Dr. Gladstone always took a great interest in educational questions, and from 1873 to 1884 he was a member of the London School Board. He was also a member of the Christian Evidence Society, and an early supporter of the Young Men's Christian Association. His death occurred suddenly in London on the 6th of October 1902.

GLADSTONE, WILLIAM Ewart (1809-1898), British statesman, was born on the 20th of December 1809 at No. 62 Rodney Street, Liverpool. His forefathers were Gladstanes of Gladstanes, in the upper ward of Lanarkshire; or in Scottish phrase, Gladstanes of that Ilk. As years went on their estates dwindled, and by the beginning of the 17th century Gladstanes was sold. The adjacent property of Arthushield remained in the hands of the family for nearly a hundred years longer. Then the last Gladstanes of Arthushield removed to Bigger, where he opened the business of a maltster. His grandson, Thomas Gladstone (for so the name was modified), became a corn-merchant at Leith. He happened to send his eldest son, John, to Liverpool to sell a cargo of grain there, and the energy and aptitude of the young man attracted the favourable notice of a leading corn-merchant of Liverpool, who recommended him to settle in that city. Beginning his commercial career as a clerk in his patron's house, John Gladstone lived to become one of the merchant-princes of Liverpool, a baronet and a member of parliament. He died in 1851 at the age of eighty-seven. Sir John Gladstone was a pure Scotman, a Lowlander by birth and descent. He married Anne, daughter of Andrew Robertson of Stornoway, sometime provost of Dingwall. Provost Robertson belonged to the Clan Donachie, and by this marriage the robust and business-like qualities of the Lowlander were blended with the poetic imagination, the sensibility and fire of the Gael.

John and Anne Gladstone had six children. The fourth son, William Ewart, was named after a merchant of Liverpool who was his father's friend. He seems to have been a remarkably good child, and much beloved at home. In 1818 or 1819 Mrs Gladstone, who belonged to the Evangelical school, said in a letter to a friend, that she believed her son William had been "truly converted to God." After some tuition at the vicarage of Seaforth, a watering-place near Liverpool, the boy went to Eton in 1821. His tutor was the Rev. Henry Hartopp Knappe. His brothers, Thomas and Roberton Gladstone, were already at Eton. Thomas was in the fifth form, and William, who was placed in the middle rank of the fourth form, became his eldest brother's fag. He worked hard at his classical lessons, and supplemented the ordinary business of the school by studying mathematics in the holidays. Mr Hawtree, afterwards headmaster, commended a copy of his Latin verses, and "sent him up for good"; and this experience first led the young student to associate intellectual work with the ideas of ambition and success. He was not a fine scholar, in that restricted sense of the term which implies a special aptitude for turning English into Greek and Latin, or for original versification in the classical languages. "His composition," we read, "was stiff," but he was imbued with the substance of his authors; and a contemporary who was in the sixth form with him recorded that "when there were thrilling passages of Virgil or Homer, or difficult passages in the Scriptores Graeci, to translate, he or Lord Arthur Hervey was generally called up to edify the class with quotation or translation." By common consent he was pre-eminently God-fearing, orderly and conscientious. At Eton," said Bishop Hamilton of St Andrews, "I was thoroughly convinced that the boy was devoid from some worse things by getting to know Gladstone." His most intimate friend was Arthur Hallam, by universal acknowledgment the most remarkable Etonian of his day; but he was not

67
generally popular or even widely known. He was seen to the greatest advantage, and was most thoroughly at home, in the debates of the Eton Society, learnedly called “The Literati,” and vulgarly “Pop,” and in the editorship of the Eton Miscellany. He left Eton at Christmas 1827. He read for six months with private tutors, and in October 1828 went up to Christ Church, where, in the following year, he was nominated as a studentship. At Oxford Gladstone read steadily, but not laboriously, till he neared his final schools. During the latter part of his undergraduate career he took a brief but brilliant share in the proceedings of the Union, of which he was successively secretary and president. He made his first speech on the 11th of February 1830. Brought up in the nurture and admonition of Canning, he defended Roman Catholic emancipation, and thought the duke of Wellington’s government unworthy of national confidence. He opposed the removal of Jewish disabilities, arguing, we are told by a contemporary, “on the part of the Evangelicals,” and pleaded for the gradual extinction, in preference to the immediate abolition, of slavery. But his great achievement was a speech against the Whig Reform Bill. One who heard this famous discourse says: “Most of the speakers rose, more or less, above their usual level, but when Mr Gladstone sat down we all of us felt that an epoch in our lives had occurred. It certainly was the finest speech of his that I ever heard.” Bishop Charles Wordsworth said that his experience of Gladstone at this time “made me (and I doubt not others also) feel no less sure than of my own existence that Gladstone, our then Christ Church undergraduate, would one day rise to be prime minister of England.” In December 1831 Gladstone crowned his career by taking a double first-class. Lord Halifax (1800-1882) used to say, with reference to the increase in the amount of reading requisite for the highest honours: “My double-first must have been a better thing than Peel’s; Gladstone’s must have been better than mine.”

Now came the choice of a profession. Deeply anxious to make the best use of his life, Gladstone turned his thoughts to holy orders. But his father had determined to make him a politician. Quitting Oxford in the spring of 1832, Gladstone spent six months in Italy, learning the language and studying art. In the following September he was suddenly recalled to England, to undertake his first parliamentary campaign. The fifth duke of Newcastle was one of the chief potentates of the High Tory party. His frank friendship and close association with the duke of Devonshire of Newark has given him a place in historical. But that claim had been rudely disputed by the return of a Radical lawyer at the election of 1831. The Duke was anxious to obtain a capable candidate to aid him in regaining his ascendancy over the rebellious borough. His son, Lord Lincoln, had heard Gladstone’s speech against the Reform Bill delivered in the Oxford Union, and had written home that “a man had risen in Israel.” At his suggestion the duke invited Gladstone to stand for Newark in the Tory interest against Mr Serjeant Wilde, afterwards Lord Chancellor Truro. The last of the Unreformed parliaments was dissolved on the 3rd of December 1832. Gladstone, addressing the electors of Newark, said that he was bound by the opinions of no man and no party, but felt it a duty to watch and resist that growing desire for change which threatened to produce “along with partial good a melancholy preponderance of mischief.” The first principle to which he looked for national salvation was, that the duties of governors are strictly and peculiarly religious, and that legislatures, like individuals, are bound to carry throughout their acts the spirit of the high truths they have acknowledged.” The connexion of the poor demanded special attention; labour should receive adequate remuneration; and he thought favourably of the allotment of cottage grounds.” He regarded slavery as sanctioned by Holy Scripture, but the slaves ought to be educated and gradually emancipated. The contest resulted in his return at the head of the poll.

The first Reformed parliament met on the 29th of January 1833, and the young member for Newark took his seat for the first time in an assembly which he was destined to adorn, delight and astonish for more than half a century. His maiden speech was delivered on the 3rd of June in reply to what was almost a personal challenge. The colonial secretary, Mr Stanley, afterwards Lord Derby, brought forward a series of resolutions in favour of the extinction of the day King William colonies. The adjournment of the debate Lord Howick, afterwards Lord Grey, who had been under-secretary for the Colonies, and who opposed the resolutions as proceeding too gradually towards abolition, cited certain occurrences on Sir John Gladstone’s plantation in Demerara to illustrate his contention that the system of slave-labour in the West Indies was attended by great mortality among the slaves. Gladstone in his reply—his first speech in the House—avowed that he had a pecuniary interest in the question, and, if he might say so much without exciting suspicion, a still deeper interest in it as a question of justice, of humanity and of religion.” If there had recently been a high mortality on his father’s plantation, it was due to the age of the slaves rather than to any peculiar hardship in their lot. It was true that the particular system of cultivation practised in Demerara was more trying than some others; but then it might be said that no two trades were equally conducive to health. Steel-grinding was notoriously unhealthy, and manufacturing processes generally were less favourable to life than agricultural. While strongly condemning cruelty, he declared himself an advocate of emancipation, but held that it should be effected gradually, and after due prepara-
tion. The slaves must be religiously educated, and stimulated to profitable industry. The owners of emancipated slaves were entitled to receive compensation from parliament, because it was parliament that had established this description of property. “I do not,” said Gladstone, “view property as an abstract thing; it is the creature of civil society. By the legislature it is granted, and by the legislature it is destroyed.” On the following day, Lord William Peel wrote to Lord Grey: “The king rejoices that a young member has come forward in so promising a manner as Viscount Althorp states Mr W. E. Gladstone to have done.” In the same session Gladstone spoke on the question of bribery and corruption at Liverpool, and on the temporalities of the Irish Church. In the session of 1834 his most important performance was a speech in opposition to Hume’s proposal to throw the universities open to Dissenters. In the third of November 1834, Lord Althorp succeeded to his father’s peerage, and thereby vacated the leadership of the House of Commons. The prime minister, Lord Melbourne, submitted to the king a choice of names for the chancellorship of the exchequer and leadership of the House of Commons; but his majesty announced that, having lost the services of Lord Althorp as leader of the House of Commons, he could feel no confidence in the stability of Lord Melbourne’s government, and that it was his intention to send for the duke of Wellington. The duke took temporary charge of affairs, but Peel was felt to be indispensable. He had gone abroad after the session, and was now in Rome. As soon as he could be brought back he formed an administration, and appointed Gladstone to a junior lordship of the treasury. Parliament was dissolved on the 29th of December. Gladstone was returned unopposed, this time in conjunction with the Liberal lawyer whom he had beaten at the last election. The new parliament met on the 19th of February 1835. The elections had given the Liberals a considerable majority. Immediately after the meeting of parliament Gladstone was promoted to the under-secretaryship for the colonies, slavery, and the official chief colonies. On the death of Lord Aberdare the office of first secretary was not long-lived. On the 30th of March Lord John Russell moved a resolution in favour of an inquiry into the temporalities of the Irish Church, with the intention of applying the surplus to general education without distinction of religious creed. This was carried against ministers by a majority of thirty-three. On the 8th of April Sir Robert Peel resigned, and the under-secretary for the colonies of course followed his chief into private life.
Released from the labours of office, Gladstone, living in chambers in the Albany, practically divided his time between his parliamentary duties and study. Then, as always, his constant companions were Homer and Dante, and it is recorded that he read the whole of St Augustine, in twenty-two octavo volumes. He used to frequent the services at the Unitarian Chapel, in Jermyn-street, and Margravine street, which was known as All Saints', Margaret Street. On the 20th of June 1837 King William IV. died, and Parliament, having been prorogued by the young queen in person, was dissolved on the 17th of the following month. Simply on the strength of his parliamentary reputation Gladstone was nominated, without his consent, for Manchester, and was placed at the bottom of the poll; but, having been at the same time nominated at Newark, was again returned. The year 1838 claims special note in a record of Gladstone's life, because it witnessed the appearance of his famous work on The State in its Relations with the Church. He had left Oxford just before the beginning of that Catholic revival which has transfigured both the inner spirit and the outward aspect of the Church of England. But the revival was now in full strength. The Tracts for the Times were saturating England with new influences. The movement counted no more enthusiastic or more valuable disciple than Gladstone. Its influence had reached him through his friendships, notably with two Fellows of Merton—Mr James Hope, who became Mr Hope-Scott of Abbotsford, and the Rev. H. E. Manning, afterwards cardinal archbishop. The State in its Relations with the Church was his practical contribution to a controversy in which his deepest convictions were involved. He contended that the Church, as established by law, was to be "maintained for its truth," and that this principle, if good for England, was good also for Ireland.

On the 25th of July 1839 Gladstone was married at Hawarden to Miss Catherine Glyne, sister, and in her issue heir, of Sir Stephen Glyne, ninth and last baronet of that name. In 1840 he published Church Principles of a Free Trade. Parliament was dissolved in June 1841. Gladstone was again returned for Newark. The general election resulted in a Tory majority of eighty. Sir Robert Peel became prime minister, and made the member for Newark vice-president of the Board of Trade. An inevitable change is from this time to be traced in the topics of Gladstone's parliamentary speaking. Instead of discoursing on the corporate conscience of the state and the endowments of the Church, the importance of Christian education, and the theological unfitness of the Jews to sit in parliament, he is solving business-like problems about foreign tariffs and the exportation of machinery; waxing eloquent over the regulation of railways, and a graduated tax on corn; subtle on the monetary merits of half-farthings, and great in the mysterious lore of quassia and cocculus indicus. In 1842 he had a principal hand in the preparation of the revised tariff, by which duties were abolished or sensibly diminished in the case of 1200 duty-paying articles. In defending the new scheme he spoke incessantly, and amazed the House by his mastery of detail, his intimate acquaintance with the commercial needs of the country, and his inextinguishable power of exposition. In 1843 Gladstone, succeeding Lord Ripon as president of the Board of Trade, became a member of the cabinet at the age of thirty-three. He has recorded the fact that "the very first opinion which he ever was called upon to give in cabinet was an opinion in favour of withdrawing the bill providing education for children in factories, to which vehement opposition was offered by the Dissenters, on the ground that it was too favourable to the Catholic Irish."

At the opening of the session of 1845 the government, in pursuance of a promise made to Irish members that they would deal with the question of academical education in Ireland, proposed to establish non-sectarian colleges in that country and to make a large addition to the grant to the Roman Catholic College of Maynooth. Gladstone resigned office, in order, as he announced in the debate on the subject, to form "not only an honest, but likewise an independent and an unsuspected judgment," on the plan to be submitted by the government with respect to Maynooth. His subsequent defence of the proposed grant, on the ground that it would be improper and unjust to exclude the Roman Catholic Church in Ireland from a "more indiscriminating support" which the state might give to various religious beliefs, was regarded by many men of less liberal views as the only proof of the there had been no adequate cause for his resignation. Before he resigned he completed a second revised tariff, carrying considerably further the principles on which he had acted in the earlier revision of 1842.

In the autumn of 1845 the failure of the potato crop in Ireland threatened a famine, and convinced Sir Robert Peel that all restrictions on the importation of food must be at once suspended. He was supported by only three members of the cabinet, and resigned on the 5th of December. Lord John Russell, who had just announced his conversion to total and immediate repeal of the Corn Laws, declined the task of forming an administration, and on the 20th of December Sir Robert Peel resumed office. Lord Stanley refused to re-enter the government, and his place as secretary of state for the colonies was offered to and accepted by Gladstone. He did not offer himself for re-election at Newark, and remained outside the House of Commons during the great struggle of the coming year. It was a curious irony of fate which excluded him from parliament at this crisis, for it seems unquestionable that he was the most advanced Free Trader in Sir Robert Peel's Cabinet. The Corn Bill passed the House of Lords on the 28th of June 1846, and on the same day the government were beaten in the House of Commons on an Irish Coercion Bill. Lord John Russell became prime minister, and Gladstone retired for a season into private life. Early in 1847 it was announced that one of the two members for the university of Oxford intended to retire at the general election, and Gladstone was proposed for the vacant seat. The representation of the university had been pronounced by Peel to be "the most objectionable part of the constitution," and Gladstone himself confessed that he "desired it with an almost passionate fondness." Parliament was dissolved on the 23rd of July 1847. The nomination at Oxford took place on the 29th of July, and at the close of the poll Sir Robert Inglis stood at the head, with Gladstone as his colleague.

The three years 1847, 1848, 1849 were for Gladstone a period of mental growth, of transition, of development. A change was silently proceeding, which was not completed for twenty years. "As before have been," he wrote in later years to Bishop Wilberforce, "two great deaths, or transmigrations of spirit, in my political existence—one, very slow, the breaking of ties with my original party." This was now in progress. In the winter of 1850–1851 Gladstone spent between three and four months at Naples, where he learned that more than half the chamber of deputies, who had followed the party of Opposition, had been banished or imprisoned; that a large number, probably not less than 20,000, of the citizens had been imprisoned on charges of political disaffection, and that in prison they were subjected to the grossest cruelties. Having made careful investigations, Gladstone, on the 7th of April 1851, addressed an open letter to Lord Aberdeen, bringing an elaborate, detailed and horrible indictment against the rulers of Naples, especially as regards the arrangements of their prisons and the treatment of persons confined in them for political offences. The publication of this letter caused a wide sensation in England and abroad, and profoundly agitated the court of Naples. In reply to a question in the House of Commons, Lord Palmerston accepted and adopted Gladstone's statement, expressed keen sympathy with the cause, and sent a copy of his letter to the queen's representative at every court of Europe. A second letter and a third followed, and their effect, though for a while retarded, was unmistakably felt in the subsequent revolution which created a free and united Italy.

In February 1852 the Whig government was defeated on a Militia Bill, and Lord John Russell was succeeded by Lord Derby, formerly Lord Stanley, with Mr Disraeli, who now
entered office for the first time, as chancellor of the exchequer and leader of the House of Commons. Mr Disraeli introduced and carried a modest budget, and the government tided over the session, and dissolved parliament on the 1st of July 1852. There was some talk of inducing Gladstone to join the Tory government, and on the 29th of November Lord Malmesbury dubiously remarked, "It is true that the Exchequer is a dark house." In the following month the chancellor of the exchequer produced his second budget. The government redeemed their pledge to do something for the relief of the agricultural interest by reducing the duty on malt. This created a deficit, which they repaired by doubling the duty on inhabited houses. The voices of criticism were heard simultaneously on every side. The debate waxed fast and furious. In defending his proposals Mr Disraeli gave full scope to his most characteristic gifts; he pelted his opponents right and left with sarcasms, taunts and epigrams. Gladstone delivered an unpremeditated reply, which has ever since been celebrated. Tradition says that he "famed at the mouth." The speech of the chancellor of the exchequer, he said, must be answered "on the moment." It must be "tried by the laws of decency and propriety." He indignantly rebuked his rival's language and demeanour. He tore his financial scheme to ribbons. It was the beginning of a duel which lasted till death removed one of the combatants from the political arena. "Those who had thought it impossible that any impression could be made upon the House after the speech of Mr Disraeli had to acknowledge that a yet greater impression was produced by the unprepared reply of Mr Gladstone." The House divided, and the government were left in a minority of nineteen. Lord Derby resigned.

The new government was a coalition of Whigs and Peelites. Lord Aberdeen became prime minister, and Gladstone chancellor of the exchequer. Having been returned again for the university of Oxford, he entered on the active discharge of his office. Lord Roebuck's committee, fitted by an unique combination of financial, administrative and rhetorical gifts. His first budget was introduced on the 18th of April 1853. It tended to make life easier and cheaper for large and numerous classes; it promised wholesale remissions of taxation; it lessened the charges on common processes of business, on locomotion, on postal communication, and on several articles of general consumption. The deficiency thus created was to be met by a "succession-duty," or application of the legacy-duty to real property; by an increase of the duties of the excise, by the extension of the income-tax, at 5d. in the pound, to all incomes between £100 and £150. The speech in which these proposals were introduced held the House spell-bound. Here was an orator who could apply all the resources of a burnished rhetoric to the elucidation of figures; who could sweep the widest horizon of the financial future, and yet stoop to bestow the minutest attention on the microcosm of penny stamps and post-horses. Above all, the chancellor's mode of handling the income-tax attracted interest and admiration. It was a searching analysis of the financial and moral grounds on which the impost rested, and a historical justification and eulogy of it. Yet, great as had been the services of the tax at a time of national danger, Gladstone could not consent to retain it as a part of the permanent and ordinary finances of the country. It was objectionable on account of its unequal incidence, of the harassing investigation into private affairs which it entailed, and of the frauds to which it inevitably led. Therefore, having served its turn, it was to be extinguished in 1860. The scheme appealed, and won the interest and attracted the country. The queen and Prince Albert wrote to congratulate the chancellor of the exchequer. Public authorities and private friends joined in the chorus of eulogy. The budget demonstrated at once its author's absolute mastery over figures and the persuasive force of his expository gift. It established the chancellor of the exchequer as the paramount financier of his day, and it was only the first of a long series of similar performances, different, of course, in detail, but alike in their bold outlines and brilliant handling. Looking back on a long life of strenuous exertion, Gladstone declared that the work of preparing his proposals about the succession-duty and carrying them through Parliament was by far the most laborious task which he ever performed.

War between Great Britain and Russia was declared on the 27th of March 1853; and it thus fell to the lot of the ministers, the devotee of retrenchment, and the anxious cultivator of all industrial arts, to prepare a war budget, and to meet as well as he might the exigencies of a conflict which had so cruelly dislocated all the ingenious devices of financial optimism. No amount of skill in the manipulation of figures, no ingenuity in shifting fiscal burdens, could prevent the addition of forty-one millions to the national debt, or could counteract the appalling mismanagement at the seat of war. Gladstone declared that the state of the arm in the Crimea was a "matter for weeping all day and praying all night." As soon as parliament met in January 1855 J. A. Roebuck, the Radical member for Sheffield, gave notice that he would move for a select committee "to inquire into the condition of our army before Sevastopol, and into the conduct of those departments of the government whose duty it has been to minister to the wants of that army." On the same day Lord John Russell, without announcing his intention to his colleagues, resigned his office as president of the council sooner than attempt the defence of the government. Gladstone, in defending the government against Roebuck, rebuked in dignified and significant terms the conduct of men who, "hoping to escape from punishment, ran away from duty." On the division on Mr Roebuck's motion the government was beaten by the unexpected majority of 157.

Lord Palmerston became prime minister. The Peelites joined him, and Gladstone resumed office as chancellor of the exchequer. A shrewd observer at the time pronounced him indispensable. "Any other chancellor of the exchequer would be torn in bits by him." The government was formed on the understanding that Mr Roebuck's proposed committee was to be appointed. Lord Palmerston soon saw that further resistance was useless; his Peelite colleagues stuck to their text, and, within three weeks after resuming office, Gladstone, Sir James Graham and Mr Sidney Herbert resigned. Gladstone once said of himself and his Peelite colleagues, during the period of political isolation, that they were like roving icebergs on which men could not land with safety, but with which ships might come into perilous collision. He now applied himself specially to financial criticism, and was perpetually in conflict with the chancellor of the exchequer Sir George Corwallis. In 1858 Lord Palmerston was succeeded by Lord Derby at the head of a Conservative administration, and Gladstone accepted the temporary office of high commissioner extraordinary to the Ionian Islands. Returning to England for the session of 1859, he found himself involved in the controversy which arose over a mild Reform Bill introduced by the government. They were defeated on the second reading of the bill, Gladstone voting with them. A dissolution immediately followed, and Gladstone was again returned unopposed for the university of Oxford. As soon as the new parliament met a vote of want of confidence in the ministry was moved in the House of Commons. In the critical division which ensued Gladstone voted with the government, who were left in a minority. Lord Derby resigned. Lord Palmerston became prime minister, and asked Gladstone to join him as chancellor of the exchequer. To vote confidence in an imperilled ministry, and on its defeat to take office with the rivals who have defeated it, is a manoeuvre which invites the reproach of turgidation. But Gladstone risked the reproach, accepted the office and had a sharp tussle for his seat. He emerged from the struggle Sir Victor Grey, and entered on his duties with characteristic zeal. The prince consort wrote: "Gladstone is now the real leader in the House of Commons, and works with an energy and vigour altogether incredible."

The budget of 1860 was marked by two distinctive features. It asked the sanction of parliament for the commercial treaty which Cobden had privately arranged with the emperor Napoleon, and it proposed to abolish the duty on paper. The French treaty
was carried, but the abolition of the paper-duty was defeated in the House of Lords. Gladstone justly regarded the refusal to remit a duty as being in effect an act of taxation, and therefore as an infringement of the rights of the House of Commons. The proposal to abolish the paper-duty was introduced in the budget of 1861, the chief proposals of which, instead of being divided, as in previous years, into several bills, were included in one. By this device the Lords were obliged to acquiesce in the repeal of the paper-duty.

During Lord Palmerston’s last administration, which lasted from 1859 to 1865, Gladstone was by far the most brilliant and most conspicuous figure in the cabinet. Except in finance, he was not able to accomplish much, for he was met and thwarted at every turn by his chief’s invincible hostility to change; but the more advanced section of the Liberal party began to look upon him as their predestined leader. In 1864, in a debate on a private member’s bill for extending the suffrage, he declared that the burden of proof lay on those “who would exclude forty-nine fiftieths of the working-classes from the franchise.” In 1865, in a debate on the condition of the Irish Church Establishment, he declared that the Irish Church, as it then stood, was in a false position, inasmuch as it ministered only to one-eighth or one-ninth of the whole community. But just in proportion as Gladstone advanced in favour with the Radical party he lost the confidence of his own constituents. Parliament was dissolved in July 1865, and the university elected Mr. Gathorne Hardy in his place.

Gladstone at once turned his steps towards South Lancashire, where he was returned with two Tories above him. The result of the general election was to retain Lord Palmerston’s government in power, but on the 18th of October the old prime minister died. He was succeeded by Lord Russell, and Gladstone, retaining the chancellorship of the exchequer, became, for the first time leader of the House of Commons. Lord Russell, backed by Gladstone, persuaded his colleagues to consent to a moderate Reform Bill, and the task of piloting this measure through the House of Commons fell to Gladstone. The speech in which he wound up the debate on the second reading was one of the finest, if not indeed the very finest, which he ever delivered. But it was of no practical avail. The government were defeated on an amendment in committee, and thereupon resigned. Lord Derby became prime minister, with Disraeli as chancellor of the exchequer, and leader of the House of Commons. On the 23rd of March 1867 the Tory Reform Bill, which ended in establishing Household Suffrage in the boroughs, was introduced, and was read a second time without a division. After undergoing extensive alterations in committee at the hands of the Liberals and Radicals, the bill became law in August.

At Christmas 1867 Lord Russell announced his final retirement from active politics, and Gladstone was recognized by acclamation as leader of the Liberal party. Nominally he was in Opposition; but his party formed the majority of the House of Commons, and could beat the government whenever they chose to mass their forces. Gladstone seized the opportunity to give effect to convictions which had long been forming in his mind. Early in the session he brought in a bill abolishing compulsory church-rates, and this passed into law. On the 16th of March, in a debate raised by an Irish member, he declared that in his judgment the Irish Church, as a State Church, must cease to exist. Immediately afterwards he embodied this opinion in a series of resolutions concerning the Irish Church Establishment, and carried them against the government. Encouraged by this triumph, he brought in a Bill to prevent any fresh appointments in the Irish Church, and this also passed the Commons, though it was defeated in the Lords. Parliament was dissolved on the 11th of November. A single issue was placed before the country—Was the Irish Church to be, or not to be, disestablished? The response was an overwhelming affirmative. Gladstone, who had been doubtfully nominated, was defeated in Lancashire, but was returned for Greenwich. He chose this moment for publishing a Chapter of Autobiography, in which he explained and justified his change of opinion with regard to the Irish Church.

On the 2nd of December Disraeli, who had succeeded Lord Derby as premier in the preceding February, announced that his colleagues, recognizing their defeat, had resigned without waiting for the formal vote of the parliament. On the following day Gladstone was summoned to Windsor, and commanded by the queen to form an administration. The great task to which the new prime minister immediately addressed himself was the disestablishment of the Irish Church. The queen wrote to Archbishop Tait that the subject of the Irish Church “made her very anxious,” but that Mr. Gladstone “showed the most conciliatory disposition.” The government can do nothing that would tend to raise a suspicion of their sincerity in proposing to disestablish the Irish Church, and to withdraw all state endowments from all religious communions in Ireland; but, were these conditions accepted, all other matters connected with the question might, the queen thinks, become the subject of discussion and negotiation.” The bill was drawn and piloted on the lines thus indicated, and became law on the 26th of July. In the session of 1870 Gladstone’s principal work was the Irish Land Act, of which the object was to protect the tenant against eviction as long as he paid his rent, and to secure to him the value of any improvements which his own industry had made. In the following session Religious Tests in the universities were abolished, and a bill to establish secret voting was carried through the House of Commons. This was thrown out by the Lords, but became law a year later. The House of Lords threw out a bill to abolish the purchase of commissions in the army. Gladstone found that purchase existed only by royal sanction, and advised the queen to issue a royal warrant cancelling, on and after the 1st of November following, all regulations authorizing the purchase of commissions.

In 1873 Gladstone set his hand to the third of three great Irish reforms to which he had pledged himself. His scheme for the establishment of a university which should satisfy both Roman Catholics and Protestants met with general disapproval. The bill was thrown out by three votes, and Gladstone resigned. The queen sent for Disraeli, who declined to take office in a minority of the House of Commons, so Gladstone was compelled to resume. But he and his colleagues were now, in Disraelian phrase, “exhausted with work.” Election after election went badly. The government had lost favour with the public, and was divided against itself. There were resignations and rumours of resignations. When the session of 1873 had come to an end Gladstone took the chancellorship of the exchequer, and, as high authorities contended, vacated his seat by doing so. The point was obviously one of vital importance; and we learn from Lord Selborne, who was lord chancellor at the time, that Gladstone “was sensible of the difficulty of either taking his seat in the usual manner at the opening of the session, or letting . . . . the necessary arrangements for business in the House of Commons be made in the prime minister’s absence. A dissolution was the only escape.” On the 23rd of January 1874 Gladstone announced the dissolution in an address to his constituents, declaring that the authority of the government had now “sunk below the point necessary for the due defence and prosecution of the public interest.” He promised that, if he were returned to power, he would repeal the income-tax. This bid for popularity failed, the general election resulting in a Tory majority of forty-six. Gladstone kept his seat for Greenwich, but was only second on the poll. Following the example of Disraeli in 1868, he resigned without meeting parliament.

For some years he had alluded to his impending retirement from public life, saying that he was “strong against going on in politics to the end.” He was now sixty-four, and his life had been a continuous experience of exhausting labour. On the 12th of March 1874 he informed Lord Granville that he could give only occasional attendance in the House of Commons during the current session, and that he must “reserve his entire freedom to devote himself to all the
responsibilities of leadership at no distant date.” His most important intervention in the debates of 1874 was when he opposed Archbishop Tait’s Public Worship Bill. This was read a second time without a division, but in committee Gladstone enjoyed some signal triumphs over his late solicitor-general, Sir William Harcourt, who had warmly espoused the cause of the government and the bill. At the beginning of 1875 Gladstone carried into effect the resolution which he had announced a year before, and formally resigned the leadership of the Liberal party. He was succeeded by Lord Hartington, afterwards Duke of Devonshire. The learned leisure which Gladstone had promised himself when released from official responsibility was not of long duration. In the autumn of 1875 an insurrection broke out in Bulgaria, and the suppression of it by the Turks was marked by massacres and outrages. Public indignation was aroused by what were known as the “Bulgarian atrocities,” and Gladstone flung himself into the agitation against Turkey with characteristic zeal. At public meetings, in the press, and in parliament he denounced the Turkish government and its champion, Disraeli, who had now become Lord Beaconsfield. Lord Hartington himself found himself pushed aside from his position of titular leadership. For four years, from 1876 to 1880, Gladstone maintained the strife with a courage, a persistence and a versatility which raised the enthusiasm of his followers to the highest pitch. The county of Edinburgh, or Midlothian, which he contested against the dominant influence of the Duke of Buccleuch, was the scene of the most astonishing exertions. As the general election approached the only question submitted to the electorate was: Do you approve or condemn Lord Beaconsfield’s foreign policy? The answer was given at Easter 1880, when the Liberals were returned by an overwhelming majority over Tories and Home Rulers combined. Gladstone was now member for Midlothian, having retired from Greenwich at the dissolution.

When Lord Beaconsfield resigned, the queen sent for Lord Hartington, the titular leader of the Liberals, but he and Lord Granville assured her that no other chief than Gladstone would satisfy the party. Accordingly, on the 23rd of April he became prime minister for the second time. His second administration, of which the main achievement was the extension of the suffrage to the agricultural labourers, was harassed by two controversies, relating to Ireland and Egypt, which proved disastrous to the Liberal party. Gladstone alienated considerable masses of English opinion by his efforts to reform the tenure of Irish land, and provoked the Irish people by his attempts to establish social order and to repress crime. A bill to provide compensation for tenants who had been evicted by Irish landlords passed the Commons, but was shipwrecked in the Lords, and a ghty record of outrage and murder stained the following 4th of July. The coercion Bill and a Land Bill passed in 1881 proved unsuccessful. On the 6th of May 1882 the newly appointed chief secretary for Ireland, Lord Frederick Cavendish, and his under-secretary, Mr. Burke, were stabbed to death in the Phoenix Park at Dublin. A new Crimes Act, courageously administered by Lord Spencer and Sir George Trevelyan, abolished exceptional crime in Ireland, but completed the breach between the British government and the Irish party in parliament.

The bombardment of the forts at Alexandria and the occupation of Egypt in 1882 were viewed with great disfavour by the bulk of the Liberal party, and were but little congenial to Gladstone himself. The circumstances of General Gordon’s untimely death awoke an outburst of indignation against those who were, or seemed to be, responsible for it. Frequent votes of censure were proposed by the Opposition, and on the 8th of June 1885 the government were beaten on the budget. Gladstone resigned. The queen offered him the dignity of an earldom, which he declined. He was succeeded by Lord Salisbury.

The general election took place in the following November. With the irresistible election tide the Lords into the Home of Commons. Gladstone had for some time been convinced of the expediency of concealing Home Rule to Ireland in the event of the Irish constituencies giving unequivocal proof that they desired it. His intentions were made known only to a privileged few, and these, curiously, were not his colleagues. The general election of 1885 showed that Ireland, outside Ulster, was practically unanimous for Home Rule. On the 17th of December an anonymous paragraph was published, stating that if Mr. Gladstone returned to office he was prepared to “deal in a liberal spirit with the demand for Home Rule.” The news that if Gladstone returned to office the Parnellites would support him, and the Tories must leave office. The government seemed to accept the situation. When parliament met they executed, for form’s sake, some confused manoeuvres, and then they were beaten on an amendment to the address in favour of Municipal Allotments. On the 1st of February 1886 Gladstone became, for the third time, prime minister. Several of his former colleagues declined to join him, on the ground of their absolute hostility to the policy of Home Rule; others joined on the express understanding that they were only pledged to consider the policy, and did not foretell their further liberty of action. On the 8th of April Gladstone brought in his bill for establishing Home Rule, and eight days later the bill for buying out the Irish landlords. Meanwhile two members of his cabinet, feeling themselves unable to support these measures, resigned. Hostility to the bills grew apace. Gladstone was implored to withdraw them, or substitute a resolution in favour of Irish autonomy; but he resolved to press at least the Home Rule Bill to a second reading. In the early morning of the 8th of June the bill was thrown out by thirty. Gladstone immediately advised the queen to dissolve parliament. Her Majesty strongly demurred to a second general election within seven months; but Gladstone persisted, and she yielded. Parliament was dissolved on the 26th of June. In spite of Gladstone’s skillful appeal to the constituencies to sanction the principle of Home Rule, as distinct from the practical provisions of his late bill, the general election resulted in a majority of considerably over 100 against his policy, and Lord Salisbury resumed office. Throughout the existence of the new parliament Gladstone never relaxed his extraordinary efforts, though now nearer eighty than seventy, on behalf of the cause of self-government for Ireland. The fertility of argumentative resource, the copiousness of rhetoric, and the physical energy which he threw into the enterprise, would have been remarkable at any stage of his public life; continued into his eighty-fifth year they were little less than miraculous. Two incidents of domestic interest, one happy and the other sad, belong to that period of political storm and stress. On the 25th of July 1889 Gladstone celebrated the fiftieth anniversary of his marriage, to his eldest son, William Henry, a man of fine character and accomplishments, died, after a lingering illness, in his fifty-second year.

The crowning struggle of Gladstone’s political career was now approaching its climax. Parliament was dissolved on the 28th of June 1892. The general election resulted in a majority of forty for Home Rule, heterogeneously composed of Liberals, Labour members and Irish.

As soon as the new parliament met a vote of want of confidence in Lord Salisbury’s government was moved and carried. Lord Salisbury resigned, and on the 12th of August 1892 Gladstone kissed hands as first lord of the treasury. He was the first English statesman that had been four times prime minister. Parliament reassembled in January 1893. Gladstone brought in his new Home Rule Bill on the 13th of February. It passed the House of Commons, but was thrown out by the House of Lords on the second reading on the 8th of September 1893. Gladstone’s political work was now, in his own judgment, ended. He made his last speech in the House of Commons on the 1st of March 1894, acquiescing in some amendments introduced by the Lords of the Privy Council. On the 3rd of March he placed his resignation in the queen’s hands. He never set foot again in the House of Commons, though he remained a member of it till the dissolution of 1895.
GLADSTONE—GLAGOLITIC

occasional visits to friends in London, Scotland and the south of France; but the remainder of his life was spent for the most part at Hawarden. He occupied his leisure by writing a rhymed translation of the Odes of Horace, and preparing an elaborately annotated edition of Butler's *Anatomy and Sermons*. He had also contemplated some addition to the Homeric studies which he had always loved, but this design was never carried into effect, for he was summoned once again from his quiet life of study and devotion to the field of public controversy. The Armenian massacres in 1894 and 1895 revived all his ancient hostility to "the governing Turk." He denounced the massacres and their perpetrators at public meetings held at Chester on the 6th of August 1895, and at Liverpool on the 24th of September 1896. In March 1897 he recapitulated the hideous history in an open letter to the duke of Westminster.

But the end, though not yet apprehended, was at hand. Since his retirement from office Gladstone's physical vigour, up to that time unequalled, had shown signs of impairment. Towards the end of the summer of 1897 he began to suffer from an acute pain, which was attributed to facial neuralgia, and in November he went to Cannes. In February 1898 he returned to England and went to Bournemouth. There he was informed that the pain had its origin in a disease which must soon prove fatal. He received the information with simple thankfulness, and only asked that he might die at home. On the 22nd of Death. March he returned to Hawarden, and there he died on the 19th of May 1898. During the night of the 21st of May the body was conveyed to London, and the coffin was placed on a bier in Westminster Hall. Throughout the 26th and 27th a vast train of people, officially estimated at 250,000, and drawn from every rank and class, moved in unbroken procession past the bier. On the 28th of May the coffin, preceded by the two Houses of Parliament and escorted by the chief magnates of the realm, was carried from Westminster Hall to Westminster Abbey. The heir-apparent and his son, the prime minister and the leader of the House of Commons, were among those who bore the pall. The body was buried in the north transept of the abbey, where, on the 19th of June 1900, Mrs Gladstone's body was laid beside it.

Mr and Mrs Gladstone had four sons and four daughters, of whom one died in infancy. The eldest son, W. H. Gladstone, (1840-1881), was a member of parliament for many years, and married the daughter of Lord Blantyre, his son William (b. 1885) inheriting the family estates. The fourth son, Herbert John (b. 1854), sat in parliament for Leeds from 1874 to 1891, and filled various offices being known as a cool and steady man. In 1891-1902; in 1910 he was created Viscount Gladstone, on being appointed governor-general of united South Africa. The eldest daughter, Agnes, married the Rev. E. C. Wickham, headmaster of Wellington, 1873-1893, and later Dean of Lincoln. Another daughter married the Rev. Harry Drew, rector of Hawarden. The youngest, Helen, was for some years vice-principal of Newnham College, Cambridge.

After a careful survey of Mr Gladstone's life, enlightened by personal observation, it is inevitable to attempt some analysis. Character. First among his moral attributes must be placed his religiousness. From those early days when a fond mother wrote of him as having been "truly converted to God," down to the verge of ninety years, he lived in the habitual contemplation of the unseen world, and regulated his private and public action by reference to a code higher than that of mere prudence or worldly wisdom. A second characteristic, scarcely less prominent than the first, was his love of power. His ambition had nothing in common with the vulgar egoism of mere personal and political stairsteppers; the only thing it was a resolute determination to possess that control over the machine of state which should enable him to fulfil without let or hindrance the political mission with which he believed that Providence had charged him. The love of power was supported by a splendid fearlessness. No dangers were too threatening for him to face, no obstacles too formidable, no tasks too laborious, no heights too steep. The love of power and the supporting courage were allied with a marked impenetrability. Of this quality there was no trace in his manner, which was courteous, conciliatory and even deferential; nor in his speech, which breathed an almost exaggerated humility. But the impenetrability showed itself in the more effectual form of action; in his sudden resolves, his invincible insistence, his recklessness of consequences to himself and his friends, his habitual assumption that the civilized world and all its units must agree with him, his indignant astonishment at the bare thought of dissent or resistance, his incapacity to believe that an overruling Providence would permit him to be frustrated or defeated. He had by nature what he himself called a "vulnerable temper and impetuous moods." But so absolute was his lifelong self-mastery that he was hardly ever betrayed into saying that which, on cooler reflection, needed to be recalled. It was easy enough to see the "vulnerable temper" as it worked within, but it was never suffered to find audible expression. It may seem paradoxical, but it is true, to say that Mr Gladstone was by nature conservative. His natural bias was to respect things as they were. In his eyes, institutions, customs, systems, so long as they had not become actively mischievous, were good because they were old. It is true that he was sometimes forced by conviction or fate or political necessity to be a revolutionist on a large scale; to destroy an established Church; to add two millions of voters to the electorate; to attack the parliamentary union of the kingdoms. But these changes were, in their inception, distasteful to the author. His whole life was spent in working for the disappearance of this institution which, in his love of freedom steadily developed, and he applied its principles more and more courageously to the problems of government. But it makes some difference to the future of a democratic state whether its leading men are eagerly on the look-out for something to revolutionize, or approach a constitutional change by the gradual processes of conviction and conversion.

Great as were his eloquence, his knowledge and his financial skill, Gladstone was accustomed to say of himself that the only quality in which, so far as he knew, he was distinguished from his fellow-men was his faculty of concentration. Whatever were the matter in hand, he so concentrated himself on it, and absorbed himself in it, that nothing else seemed to exist for him.

A word must be said about physical characteristics. In his prime Gladstone was just six feet high, but his inches diminished as his years increased, and in old age the unusual size of his head and breadth of his shoulders gave him a slightly top-heavy appearance. His features were strongly marked; the forehead was broad, the nose deep-set, the mouth severe and lined. His flashing eyes were deep-set, and in colour resembled the onyx with its double band of brown and grey. His complexion was of an extreme pallor, and, combined with his jet-black hair, gave in earlier life something of an Italian aspect to his face. His dark eyebrows were singularly flexible, and they perpetually expanded and contracted in harmony with what he was saying. He held himself remarkably upright, and even from his school-days at Eton had been remarked for the rapid pace at which he habitually walked. His voice was a baritone, singularly clear and far-reaching. In the Waverley Market at Edinburgh, which is said to hold 20,000 people, he could be heard without difficulty; and as late as 1895 he said to the present writer: "What difference does it make to me whether I speak to 400 or 4000 people?" His physical vigour in old age earned him the popular nickname of the Grand Old Man.

Lord Morley of Blackburn's *Life of Gladstone* was published in 1893.

GLADSTONE, a seaport of Clinton county, Queensland, Australia, 328 m. by rail N.E. of Brisbane. Pop. (1901) 1566. It possesses a fine, well-sheltered harbour reputed one of the best in Queensland, at the mouth of the river Boyne. Gold, manganese, copper and coal are found in the neighbourhood. Gladstone, founded in 1847, became a municipality in 1883.

GLAGOLITIC, an early Slavonic alphabet: also the liturgy written therein, and the people (Dalmatians and Roman Catholic
GLAIR—GLAMORGANSHIRE

Montenegrins) among whom it has survived by special licence of the Pope (see SLAVS for table of letters).

The name of Glamis is derived from the Gaelic, glamaidh, probably from Lat. darsus, clear, bright), the white of an egg, and hence a term used for a preparation made of this and used, in bookbinding and in gilding, to retain the gold and as a varnish. The adjective “glairy” is used of substances having the viscous and transparent consistency of the white of an egg.

GLAISHER, JAMES (1809–1903), English meteorologist and aeronaut, was born in London on the 7th of April 1809. After serving for a few years on the Ordnance Survey of Ireland, he acted as an assistant at the Cambridge and Greenwich observatories successively, and when the department of meteorology and magnetism was formed at the latter, he was entrusted with its superintendence, which he continued to exercise for thirty-four years, until his retirement from the public service. In 1845 he published his well-known dew-point tables, which have gone through many editions. In 1850 he established the Meteorological Society, acting as its secretary for many years, and in 1866 he assisted in the foundation of the Aeronautical Society of Great Britain. He was appointed a member of the royal commission on the warming and ventilation of dwellings in 1875, and for twelve years from 1880 acted as chairman of the executive committee of the Palestine Exploration Fund. But his name is best known in connexion with the series of balloon ascents which he made between 1862 and 1866, mostly in company with Henry Tracey Coxwell. Many of these ascents were arranged by a committee of the British Association, of which he was a member, and were strictly scientific in character, the object being to carry out observations on the temperature, humidity, &c., of the atmosphere at high elevations. In one of them, that which took place at Wolverhampton on the 4th of September 1862, Glaisjer and his companion attained the greatest height that had been reached by a balloon carrying passengers. As no automatically recording instruments were available, and Glaisjer was unable to read the barometer at the highest point owing to loss of consciousness, the precise altitude can never be known, but it is estimated at about 7 m. from the earth. He died on the 7th of February 1903 at Croydon.

GLAMIS, a village and parish of Forfarshire, Scotland, 51 m. W. by S. of Forfar by the Caledonian railway. Pop. of parish (1901) 1351. The name is sometimes spelled Glammis and the i is mute: it is derived from the Gaelic, glamhus, “a wide gap,” “a vale.” The chief object in the village is the sculptured stone, traditionally supposed to be a memorial of Malcolm II., although Fordun’s statement that the king was slain in the castle is now rejected. About a mile from the station stands Glamis Castle, the seat of the earl of Strathmore and Kinghorne, a fine example of the Scottish Baronial style, enriched with certain features of the French château. In its present form it dates mostly from the 17th century, but the original structure was as old as the 11th century, for Macbeth was Thane of Glamis. Several of the early Scots kings, especially Alexander III., used it occasionally as a residence. Robert II. bestowed the thanedom on John Lyon, who had married the king’s second daughter by Elizabeth Mure and was thus the founder of the existing family. Patrick Lyon became hostage to England for James I. in 1434. When, in 1537, Janet Douglas, widow of the 6th Lord Glamis, was burned at Edinburgh as a witch, for conspiring to procure James V.’s death, Glamis was forfeited to the crown, but it was restored to her son six years later when her innocence had been established. The 3rd earl of Strathmore entertained the Old Chevalier and eighty of his immediate followers in 1715. After discharging the duties of hospitality the earl joined the Jacobites at Sheriffmuir and fell on the battlefield. Sir Walter Scott spent a night in the “hoary old pile” when he was about twenty years old, and gives a striking relation of his experiences in his Demonology and Witchcraft. The hall has an arched ceiling and several old carvings and paintings of the 17th century. At Cossens, in the parish of Glamis, there is a remarkable sculptured monolith, and other examples occur at the Hunters’ Hill and in the old kirkyard of Eassie.

GLAMORGANSHIRE (Welsh Morgannwg), a maritime county occupying the south-east corner of Wales, and bounded N.W. by Carmarthenshire, N. by Carmarthenshire and Breconshire, E. by Monmouthshire and S. and W. by the Bristol Channel and Carmarthen Bay. The contour of the county is largely determined by the fact that it lies between the mountains of Breconshire and the Bristol Channel. Its extreme breadth from the sea inland is 29 m., while its greatest length from east to west is 25 m. Its chief rivers, the Rhymney, Taff, Neath (or Néod), and Tawe or Towy, have their sources in the Breconshire mountains, the two first trending towards the south-east, while the other two trend to the south-west, so that the main body of the county forms a sort of quarter-circle between the Taff and the Neath. Near the apex of the angle formed by these two rivers is the loftiest peak in the county, the great Pennant scarps of Craig y Llyn or Carn Moseyn, 1750 ft. high, which in the Glacial period diverted the ice-flow from the Beacons into the valley on either side of it. To the south and south-east of this peak extend the great coal-fields of mid-Glamorgan, their surface forming an irregular plateau with an average elevation of 600 to 1200 ft. above sea-level, but with numerous peaks about 1500 ft. high, or more; Mynydd y Caerau, the second highest being 1823 ft. Out of this plateau have been carved, to the depth of 500 to 800 ft. below its general level, three distinct series of narrow valleys, those in each series being more or less parallel. The rivers which give their names to these valleys include the Cynon, the Great and Lesser Rhonda (tributaries of the Taff) and the Ely flowing to the S.E., the Ogwr or Ogmore (with its tributaries the Garw and Llynfi) flowing south through Bridgend, and the Avon bringing the waters of the Cowg and Gwymi to the south-west into Swansea Bay at Aberavon. To the south of this central hill country, which is wet, cold and sterile, and whose steep slopes form the southern edge of the coal-field, there stretches out to the sea a gently undulating plain, comparatively known as the “Vale of Glamorgan,” but in fact consisting of a succession of small vales of such fertile land and with such a mild climate that it has been styled, not inaptly, the “Garden of Wales.” To the east of the central area referred to and divided from it by a spur of the Brecon Beacons mountain culminating in Carn Bugail, 1750 ft. high, is the Rhymney, which forms the county’s eastern boundary. On the west other spurs of the Beacons divide the Neath from the Tawe (which enters the sea at Swansea), and the Tawe from the Loughor, which, with its tributary the Amman, separates the county on the N.W. from Carmarthenshire, in which it rises, and falling into Carmarthen Bay forms what is known as the Burry estuary, so called from a small stream of that name in the Gower peninsula. The rivers are all comparatively short, the Taff, in every respect the chief river, being only 33 m. long.

Down to the middle of the 19th century most of the Glamorgan valleys were famous for their beautiful scenery, but industrial operations have since destroyed most of this beauty, except in the so-called “Vale of Glamorgan,” the Vale of Neath, the “combes” and limestone gorges of Gower and the upper reaches of the Taff and the Tawe. The Vale of Neath is par excellence the waterfall district of South Wales, the finest falls being the Cilhepse fall, the Sychnant and the three Clunwyns on the Melinc and its tributaries near the Vale of Neath railway from Neath to Hirwaun, Scwd Einon Gam and Scwd Gladys on the Pyrdyn on the west side of the valley close by, with Melin Court and Abergarwed still nearer Neath. There are also several cascades on the Dulais, and in the same district, though in Breconshire, is Scwd Henrhdy on the Llech near Colbren Junction. Almost the only part of the county which is now well timbered is the Vale of Neath. There are three small lakes, Llyn Fawr and Llyn Fach near Craig y Llyn and Kenfig Pool amid the sand-dunes of Margam. The rainfall of the county varies from an average of about 25 in. at Porthcawl and other parts of the Vale of Glamorgan to about 37 in. at Cardiff, 40 in. at Swansea and to upwards of 70 in. in the northern part of the county,
the fall being still higher in the adjoining parts of Breconshire whence Cardiff, Swansea, Merthyr, and a large area near Neath draw their main supplies of water.

The county has a coast-line of about 83 m. Its two chief bays are the Burry estuary and Swansea, one on either side of the Gower Peninsula, which has also a number of smaller inlets with magnificent cliff scenery. The rest of the coast is fairly regular, the chief openings being at the mouths of the Ogmore and the Taff respectively. The most conspicuous headlands are Whiteford Point, Worms Head and Mumbles Head in Gower, Nash Point and Lavernock Point on the eastern half of the coast.

The existing coal deposits, an area of 382 acres, are formed of the coal-bearing, partly limestone, partly sandstone, which is extensive to the north of Cardiff, and consist of mudstones and sandstones of Wenlock and Ludlow age; a feeble representative of the Wenlock Limestone also is found in the clay and grit beneath the Coal Measures. By the old name of Old Red Sandstone, we mean the sandstones, shales, and coal-bearing beds of the Coal Measures, which are mainly confined to the area of Glamorgan and occurring mostly in the north and south of the county, which show a large development of limestones and shales. The county extends westwards as far as Cowbridge as a deeply eroded anticline largely concealed by Trías and Lias. The Old Red Sandstone consists in the lower parts of red marls and sandstones, while the upper beds are quartzitic and pebbly, and form bold scarps which dominate the low ground of the softer beds below. Cefn-y-bryn, another anticline of Old Red Sandstone (including small exposures of Silurian rocks), forms the prominent backbone of the Gower peninsula. The next formation is the Carboniferous Limestone which encircles and underlies the great Swansea Valley, on the southern side, which, we observe, forms a bold escarpment of steeply-dipping beds surrounding the Old Red Sandstone anticline. It shows up through the Trías and Lias in extensive inliers near Bridgend, while in Gower it dips away from the coast, and is covered by the Carboniferous Limestone, and the coal-field is just reached near Merthyr Tydfil. The Millstone Grit, which consists of grits, sandstones and shales, crops out above the limestone and serves to introduce the Coal Measures, which lie on top. The coal measures were formed of silt, sand, and gravel accumulated across the country and occupying most of its surface. The coal seams are most numerous in the lower part of the series; the Pennant Sandstone succeeds and occupies the inner parts of the basin, forming an elevated midland region deeply trenched by the teeming valleys (e.g., the Rhonda) which cross the coal-field from north to south. Above the Pennant Sandstone still higher coals come in. Taken generally, the coal is of a greyish-brown colour with a large proportion of bituminous in the south-east and anthracite in the north-west.

After the Coal Measures had been deposited, the southern part of the region was subjected to powerful folding; the resulting anticlines were worn down during a long period of detrition, and then submerged slowly beneath a Triassic lake in which accumulated the Keuper conglomerates and marls which spread over the district west of Cardiff and are traceable on the coast of Gower. The succeeding Rhaetic and Lias which form most of the coastal plain (the fertile Vale of Glamorgan) from Penarth near Bridgend were laid down on the coal measuring sea. In Glamorgan, therefore, there is no traceable in Gower. Sand-dunes are present locally around Swansea Bay. Moraines, chiefly formed of gravel and clay, occupy many of the Glamorgan valleys; and these, together with the striated stones and a few eskers, are observed as prominent land forms, and in origin, in the Coal Measures and the newer Limestones and Triassic. A leading feature is the wide river valleys, and marls and shales, many inches thick, strewn about the surface. Fish-eating reptiles, including the included in an air-breathing reptile (Archaeoscapton). Bones of the cave-bear, lion, mammoth, reindeer, rhinoceros, along with flint weapons and tools, have been discovered in some caves of the Gower peninsula.

The low-lying land on the south from Cardiff to Margam is very fertile, the soil being a deep rich loam; and here the standard of agriculture is fairly high, and there prevails a well-developed tenant-right custom, supposed to be of German origin, probably dating only from the beginning of the 19th century. Everywhere on the Coal Measures the soil is poor, while vegetation is also injured by the smoke from the works, especially copper smokes. Loamy soils, however, are the most productive in Glamorgan, as the river valleys are bordered by large areas of grass but little wood, while the mountains had "rode dere, kiddles plenty, oxen and sheep." The land even in the Vale seems to have been rather well cultivated before the introduction of the 16th century, while enclosure spread to the uplands still later. About one-fifth of the total area is still common land, more than half of which is unsuitable for cultivation. The total area under cultivation is 171,397 acres, of which 12,089 acres are in the county of the chief crops raised (giving them in the order of their respective acreages) are oats, barley, turnips and swedes, wheat, potatoes and mancolds. A steady decrease of the acreage under these crops has marked the last century. The chief crops have been increased by an increase in the area of pasture, Dairying has been largely abandoned for stock-raising, and very little "Cæphilly cheese" is now produced. The climate of the county, from the time of the Roman occupation till the present time, has been marked by a number of horses in agriculture of any Welsh county except those of Carmarthen and Cardigan. Good sheep and ponies are reared in the hill-country. Pig-keeping is much neglected, and despite the mild climate very little fruit is grown. The average size of holdings in 1905 was 47-3 acres, there being only 46 holdings above 300 acres, and 171 between 50 and 500 acres.

Mining and Manufactures.—Down to the middle of the 18th century the county had no industry of any importance except agriculture. The coal which the ancient inhabitants of the county except the Vale of Glamorgan and West Gower was little worked till about 1755, when it began to be used instead of wood for fuel. By the middle of the 19th century the supply of the blast furnaces in the county, the demand for coal for this purpose had much increased, but it was in the most active period of railway construction that it reached its maximum. Down to about 1850, half the coal mined in Glamorgan was used for smelting iron, and the chief furnaces were worked for their own requirements, but when the suitability of the lower seams in the district north of Cardiff for steam purposes was discovered, the great increase in the demand for coal resulted in the development of the large ironworks, with the result that the introduction of the great iron company (from which port it is mostly shipped) dates mainly from the closing years of the 19th century, when the demand for this coal grew rapidly. There are still large areas in the Rhymney Valley on the east, and in the districts of Neath and Swansea on the west, whose development has only recently been undertaken. In connexion with the coal industry, patent fuel (made from small coal and tar) is largely manufactured at Cardiff, Port Talbot and Swansea, the shipments from Swansea being the largest in the kingdom. Next in importance to coal are the iron, steel and tin-plate industries, and in the Swansea district the smelting of copper and a variety of other ores.

The manufacture of iron and steel is carried on at Dowhals, Merthyr Tydfil, Cardiff, Port Talbot, Briton Ferry, Pontardawe, Swansea, Neath, Aberavon, and Port Talbot. The latter is the chief of these and has the broadest view of the country and the largest works. The manufacture of tin-plate is confined to the north of Glamorgan, where there are works near Llanrhiyst with and at Penygraig near Rhondda, and the latter being the oldest in the county. Copper-smelting is carried on on a large scale in the west of the county, and Swansea and Penygraig. Large plates have been established near the south and sea-board; e.g., the Dowhals company in 1891 opened large works at Cardiff. The tin-plate industry is mainly confined to the west of the county, Swansea being the chief port for the shipment of tin-plates, though there are works near Llanrhiyst with and at Penygraig near Cardiff, the latter being the oldest in the county. Copper-smelting is carried on on a large scale in the west of the county, and Swansea and Penygraig. Large plates have been established near the south and sea-board; e.g., the Dowhals company in 1891 opened large works at Cardiff. The tin-plate industry is mainly confined to the west of the county, Swansea being the chief port for the shipment of tin-plates, though there are works near Llanrhiyst with and at Penygraig near Cardiff, the latter being the oldest in the county. Copper-smelting is carried on on a large scale in the west of the county, and Swansea and Penygraig. The county is therefore a large producer of tin-plate.

Fishing.—Fishes all along the coast; by lines, draught-nets, dredging, trawling, fixed nets and by hand. There is a fleet of over 600 vessels, including the most modern style of boat, with canvas and sail, and a number of fishing trawlers, including one of the largest in the world; Swanage Bay, and has a small fleet of small boats, and at Penygraig near Rhondda, the nickel being carried to South Wales.

There are good fishmarkets at Swansea and Cardiff.

Communications.—The county has ample dock accommodation. The various docks of Cardiff amount to 210 acres, including timber ponde; Penarth has a dock and basin of 26 acres and a tidal harbour at the entrance. Barry docks cover 114 acres; Swansea has 147 acres, including its new King's Dock; and Port Talbot 90 acres. There are also docks at Briton Ferry and Porthcawl, but they are not capable of admitting deep-draft vessels.

There are abundant means of transit in many railways, of which the Great Western is the chief. Its trunk line traversing the country between the mountains and the sea passes through the county from Port Talbot and Swansea to the Welsh border, and throws off numerous branches to the north. The Tafl Vale railway serves all the valley of the Tafl and its tributaries, and has also extensions to Barry and (through Llanrhiyst with and Cowbridge) to Newport and the Severn. There is a goods train to the Vale of Glamorgan, and has a joint service with the Great Western between Cardiff and Merthyr Tydfil—the latter town being also the terminus of the Brecon and Merthyr and a branch from Newport to the Vafl Vale and opens to a small branch to Newport from Brecon by the Midland, with Craven Arms and Mid-West-generally by the London & North-Western, with the Rhonda Valley by the Rhondda and Swansea Bay (now worked by the Great Western) and with Mumbles by the Mumbles railway. The Port Talbot
GLAMORGANSHIRE

75

railway runs to Blaengarw, and the Neath and Brecon railway (started 1902), along the Midland at Colbren Junction. The canals of the county are the Glamorgan canal from Cardiff to Merthyr Tydfil (253 m.), with a branch (7 m.) to Aberdare, the Neath canal (352 m.), and the Taff canal (218 m.), (where a railway was formerly connected with Aberdare), the Tennant canal connecting the rivers Neath and Tawe, and the Swansea canal (164 m.), running up the Swansea Valley from Swansea to Aberdare. The canal use is now of the canals, excepting the lower portions of the Glamorgan canal.

Population and Administration.—The area of the ancient county was 1,870,000 acres, with a population in 1901 of 859,931 persons. In the three decades between 1821 and 1861 it increased 35%, 35% and 37% respectively, and in 1861-1891, 1891-1921, its average increase in the other decades was 21%. The Glamorgan county is divided into five parliamentary divisions (viz. Glamorgan-shire East, South and Middle, Gower and Rhonda); it also includes the Carpenters, Penallta, Aberdare, Cowbridge, (Llanristan), which has one member; the greater part of the parliamentary borough of Merthyr Tydfil (which mainly consists of the county borough of Merthyr, the urban district of Aberdare and part of Mountain Ash), and returns two members; and the two divisions of Swansea District returning one member each, one division consisting of the major part of Swansea town, the other comprising the remoter part of Swansea and the boroughs of Aberavon, Llchwarch and Neath. There are six municipal boroughs: Aberavon, pop. in 1901, 7553, Cardiff (164,333), Cowbridge (1202), Merthyr Tydfil (69,228), Neath (13,720) and Swansea (94,537). Cardiff (with the Metropolitan borough) was created a city, Merthyr Tydfil and Swansea are county boroughs. The following are urban districts: Aberdare (43,365), Barry (27,030), Bridgend (6062), Briton Ferry (6973), Caerphilly (15,533), Glyncorrwg (6454), Maesteg (15,012), Margaret (32,316), Neath (5363), Oxwich (19,907), Pontardawe (4467), Penarth (4,228), Pontypridd (32,316), Porthcawl (1872) and Rhonda, previously known as Ystradfodog (11,723). Glamorgan is in the St. Wæl's circuit, and both assizes and quarter-sessions are held at Cardiff and Swansea alternately. All the municipal boroughs have separate commissions of the peace, and Cardiff and Swansea have also separate courts of quarter-sessions. The county has thirteen other petty sessional divisions. The districts of the Rhondda (with Pontypridd) and the Merthyr and Aberdare districts have stipendiary magistrates. There are 165 civil parishes. Excepting the three which are in the smaller portion of the county of St David's, the whole county is in the diocese of Llandaff. There are 159 ecclesiastical parishes or districts situated wholly or partly within the county.

History.—The earliest known traces of man within the area of the present county are the remains found in the famous bone-caves of Gower, though they are scanty as compared with the huge deposits of still earlier animal remains. To a later stage of pre-Roman life belongs a number of complete skeletons discovered in 1903 in sand-blown tumuli at the mouth of the Ogmore, where many flint implements were also found. Considerably later, and probably belonging to the Bronze Age (though finds of bronze implements have been scanty), are the many cairns and tumuli, mainly on the hills, such as on Garth Mountain near Cardiff, Crug-yr-avan and a number east of the Tawe; the stone circles often found in association with the tumuli, that of Carn Llechgarth near Pontardawe being one of the most complete in Wales; and the fine cromlechs of Cefn Bryn in Gower (known as Arthur's Stone), of St Nicholas and of St Lythan's near Cardiff.

In Roman times the country from the Neath to the Wye was occupied by the Silures, a pre-Celtic race, probably governed at that time by Brythonic Celts. West of the Neath and along the fringe of the Brecknock Mountains were probably remnants of the earlier Goidelic Celts, who have left traces in the place-names of the Swansea valley (e.g. Ruch, "a lake") and in the illegible Caradoc, the only other Ogham stone in the county being at Kenfig, a few miles to the east of the Neath estuary. The conquest of the Silures by the Romans was begun about A.D. 50 by Ostorius Scapula and completed some 25 years later by Julius Frontinus, who probably constructed the great military road, called Via Julia Maritima, from Gloucester to St David's, with stations at Cardiff, Bovium (variously identified with Boverton, Cowbridge and Ewenny), Nidum (identified with Neath) and Leucarum or Louhore. The important station of Caractacus was the Usk near Brecon was connected by two branch roads, one from Cardiff through Gelligaer (where there was a strong hill fort) and Merthyr Tydfil, and another from Neath through Capel Colbren. Welsh tradition credits Glamorgan with being the first home of Christianity, and Llandaff is the earliest bishopric in Britain, the name of three reputed missionaries of the 3rd century being preserved in the names of parishes in south Glamorgan. What is certain, however, is that the first two bishops of Llandaff, St Dubricius and St Telio, lived during the first half of the 6th century, the period also belong to the establishment of the great monastic settlements of Llanerchwyn at Cadoc, of Llandough by Odocus and of Llanwit Major by Illtutus, the last of which flourished as a seat of learning down to the 12th century. Some moated mounds such as at Cardiff indicate that, after the withdrawal of the Romans, the coast was visited by small bands of Saxons, but the Scandinavians who came in the 9th and succeeding centuries left more abundant traces both in the place-names of the coast and in such camps as that on Sully Island, the Bulwarks at Porthkerry and Gardings Down in Gower. Meanwhile the native tribes of the district had regained their independence under a line of Welsh chieftains, whose domain was consolidated into a principality known as Glywysing, till about the end of the 10th century when it acquired the name of Morganwg, that is the territory of Morgan, a prince who died in A.D. 965; it then comprised the whole of the two counties from the Neath to the Llantwit Major, and corresponded to the present diocese of Llandaff. Gwlad Morgan, later softened into Glamorgan, never had much vague and must precisely the same as Morganwg, though the two terms became differentiated a few centuries later.

The Norman conquest of Morganwg was effected in the closing years of the 11th century by Robert Fitzhamon, lord of Gloucester. His followers settled in the low-lying lands of the Vale, which became known as the "body of the shire, while in the hill country, which consisted of ten "members," corresponding to its ancient tribal divisions, the Welsh retained their customary laws and much of their independence. Glamorgan, whose bounds were now contracted between the Neath and the Rhy弥then, became a lordship marcher, its status and organization being that of a county palatine; its lord possessed jura regalia, and his chief official was from the first a vice-comes, or sheriff, who presided over a county court composed of his lord's principal tenants. The inhabitants of Cardiff in which, as the caput baroniae, this court was held (though sometimes ambulatory), were soon granted municipal privileges, and in time Cowbridge, Kenfig, Llanristan, Aberavon and Neath also became charterd market-towns. The manorial system was introduced throughout the "Vale," the manor in many cases becoming the parish, and the owner building for its protection first a castle and then a church. The church itself became Normanized, and monasteries were established—the Cistercian abbey of Neath and Margam in 1129 and 1147 respectively, the Benedictine priory of Ewenny in 1141 and that of Cardiff in 1147. Dominican and Franciscan houses were also founded at Cardiff in the following century.

Gower (with Kilvey) or the country west of the morass between Neath and Swansea had a separate history. It was conquered about 1100 by Henry de Newburgh, 1st earl of Warwick, by whose descendants and the powerful family of De Breos it was successively held as a marcher lordship, organized to some extent on county lines, till 1149. Swansea (which was the caput baroniae of Gower) and Loughor received their earlier charters from the lords of Gower (see GOWER).

For the first two centuries after Fitzhamon's time the lordship of Glamorgan was held by the earls of Gloucester, a title conferred by Henry I on his natural son Robert, who acquired Glamorgan by marrying Fitzhamon's daughter. To the 1st earl's patronage of Geoffrey of Monmouth and other men of letters, at Cardiff Castle of which he was the builder, is probably due the large place which Celtic romance, especially the Arthurian cycle, won for itself in medieval literature. The lordship passed by descent through the families of Clare (who held it from 1217 to 1317), Despenser, Beauchamp and Neville to Richard III., on whose fall it escheated to the crown. From time to time, the Welsh of the hills, often joined by their countrymen from other
GLANDERS

parts, raided the Vale, and even Cardiff Castle was seized about 1153 by Ivor Bach, lord of Senghenydd, who for a time held its lord a prisoner. At last Caerphilly Castle was built to keep them in check, but this provoked an invasion in 1199 by Prince Llewelyn ap Griffith, who besieged the castle and refused to retire except on conditions. In 1316 Llewelyn Bren headed a revolt in the same district, but being defeated was put to death by Despencer, whose great unpopularity with the Welsh made Glamorgan less safe as a retreat for Edward II. a few years later. In 1404 Glendower swept through the county, burning castles and laying waste the possessions of the king's supporters. By the Act of Union in 1535 the county of Glamorgan was incorporated as it now exists, by the addition to the old county of the lordships of Gower and Kilvey, west of the neck. By another act of 1542 the court of great sessions was established, and Glamorgan, with the counties of Brecon and Radnor, formed one of its four Welsh circuits from thence till 1830, when the English assize system was introduced into Wales. In the same year the county was given one parliamentary representative, increased to two in 1832 and to five in 1885. The boroughs were also given a member. In 1832 Cardiff (with Llantrissant and Cowbridge), the Swansea group of boroughs and the parliamentary borough of Merthyr Tydfil were given one member each, increased to two, in the case of Merthyr Tydfil in 1867. In 1885 the Swansea group was divided into two constituencies with a member each. The lordship of Glamorgan, shorn of its quasi-regal status, was granted by Edward VI. to William Herbert, afterwards 1st earl of Pembroke, from whom it has descended to the present marquess of Bute.

The rule of the Tudors promoted the rapid assimilation of the inhabitants of the county, and by the reign of Elizabeth even the descendants of the Norman kings had largely become Welsh both in speech and sentiment. Welsh continued to be the prevalent speech almost throughout the county, except in the south-east of the county generally, while fairly holding its own, despite much English migration, in the industrial districts to the north. In 1901 about 56% of the total population above three years of age was returned as speaking English only, 37% as speaking both English and Welsh, and about 6% as speaking Welsh only.

In common with the rest of Wales the county was mainly Royalist in the Civil War, and indeed stood foremost in its readiness to pay ship-money, but when Charles I. visited Cardiff in July 1645 he failed to recruit his army there, owing to the dissatisfaction of the county, which a few months later declared for the parliament. There was, however, a subsequent Royalist revolt in Glamorgan in 1646, but it was signally crushed by Colonel Horton at the battle of St Fagan's (5th of May).

The educational gap caused by final disappearance of the great university of Llantwit Major, founded in the 6th century, and by the dissolution of the monasteries was to some extent filled by the foundation, by the Stradling family, of a grammar school at Cowbridge which, refounded in 1685 by Sir Leoline Jenkins, is still carried on as an endowed school. The only other ancient grammar school is that of Swansea, founded by Bishop Gore in 1682, and now under the control of the borough council. Besides the University College of South Wales and Monmouthshire established at Cardiff in 1883, and a technical college at Swansea, there is a Church of England theological college (St Michael's) at Llandaff (previously at Aberdare), a training college for school-mistresses at Swansea, schools for the blind at Cardiff and Swansea and for the deaf at Cardiff, Swansea and Pontypried.

Antiquities.—The antiquities of the county not already mentioned include an unusually large number of castles, all of which, except the castles of Moelais (near Merthyr Tydfil), Castell Coch and Llantrissant, are between the hill country and the valleys of the Glamorgan and the Usk. The castle of Caerphilly, but there are also more or less imposing ruins at Oystermouth, Coly, Newcastle (at Bridgend), Llanblethian, Pennard and Swansea.

Among the restored castles, resided in by their present owners, are St Donat's, "the latest and most complete of the structures built for defence," the residence of the marquess of Bute, St Fagan's, Dunraven, Fonmon and Penrice. Of the monastic buildings, that of Ewenny is best preserved, Neath and Margam are mere ruins, while all the others have disappeared. Almost all the older churches possess towers of a somewhat military character, and most of them, except in Gower, retain some Norman mockery. Coity, Coychurch and Ewenny (all near Bridgend) are fine examples of cross churches with embattled towers characteristic of the county. There are interesting monumental effigies at St Mary's, Swansea, Oewich, Ewenny, Margam, Llantwit Major, Llantwit Pwllheli, Glenmorris and Vale. There are from twenty-five to thirty sculptured stones, of which some sixteen are both ornamented and inscribed, five of the latter being at Margam and three at Llantwit Major, and dating from the 9th century if not earlier.

Authorities.—The records of the Curia comitatus or County Court of Glamorgan are supposed to have perished, so also have the records of Neath. With these exceptions, the records of the county have been well preserved. A collection edited by G. T. Clark under the title Cartae et alia munimenta quae ad dominium de Glamorgano pertinent, was printed in four volumes (1885—1903). A Descriptive Catalogue of the Principality and Glamorgan Abbey MSS, in the Possession of Messrs Talbot of Margam (6 vols.) was privately issued (1893—1906) under the editorship of Dr de Gray Rice Morgan, who has also published the Records of Neath and Margam. The book of Llan Daf (edited by Dr Gwengyra Evans, 1903) contains documents illustrative of the early history of the diocese of Llandaff. Cardiff has published its Records in 4 vols., and there is a volume of Swansea charters, a complete history of the county, except a modest but useful one in Welsh.—Hanes Morfaen, by D. W. Jones (Dafydd Morganwg (1874); the chief contributions are Rice Merrick's Books of Glamorgan's Antiquities, written in 1578; The Land of Morgan (1883) (a history of the lordship of Glamorgan), by G. T. Clark, whose Genealogies of Glamorgan (1886) and Medieval Military Architecture (1884) are also indispensable; see also T. Nicholas, Annals and Antiquities of the Counties and County Families of Wales (2 vols., 1872). For Gower, see Gower.

GLANDERS, or FARY (Equine), a specific infective and contagious disease, caused by a tissue parasite (Bacillus mellici), to which certain animals, chiefly the horse, ass and mule, are liable, and which is communicable from them to man. Glanders in the domesticated animals is dealt with under veterinary science; it is rarely a form of disease in man, there being evidently less affinity for its development in the human subject than in the equine species. For the pathology see the article PARASITIC DISEASES. It occurs chiefly among those who from their occupation are frequently in contact with horses, such as grooms, coachmen, cavalry soldiers, veterinary surgeons, &c.; the bacillus is communicated from a glandered animal either through a wound or scratch or through application to the mucous membrane of the nose or mouth. A period of incubation, lasting from three to five days, generally follows the introduction of the virus into the human system. This period, however, appears sometimes to be of much longer duration, especially where there has been no direct inoculation of the poison. The first symptoms are a general feeling of illness, accompanied with pains in the limbs and joints resembling those of acute rheumatism. If the disease has been introduced by means of an abraded surface, pain is felt at that point, and inflammatory swelling takes place there, and extends along the neighbouring lymphatics. An ulcer is formed at the point of inoculation which discharges an offensive ichor, and blebs appear in the inflamed skin, along with diffuse abscesses, as in phlegmonous erysipelas. Sometimes the disease stops short with these local manifestations, but more commonly goes on rapidly accompanied with symptoms of grave constitutional disturbance. Over the whole surface of the body there appear numerous red spots or pustules, which break and discharge a thick mucous or sanguineous fluid. Besides these there are larger swellings lying deeper in the subcutaneous tissue, which at first are extremely hot and painful, and to which the terms "hot " or "lukrous " is applied. They ultimately open and become extensive sloughing ulcers.

The mucous membranes participate in the same lesions as
are present in the skin, and this is particularly the case with the interior of the nose, where indeed, in many instances, the disease first of all shows itself. This organ becomes greatly swollen and inflamed, while from one or both nostrils there exudes a copious discharge of highly offensive purulent or sanguineous matter. The lining membrane of the nostrils is covered with papules similar in character to those on the skin, which form ulcers, and may lead to the destruction of the cartilaginous and bony textures of the nose. The diseased action extends into the throat, mouth and eyes, while the whole face becomes swollen and erysipelasulous, and the lymphatic glands under the jaws inflame and suppurate. Not infrequently the bronchial tubes become affected, and cough attended with expectoration of matter similar to that discharged from the nose is the consequence. The general constitutional symptoms are exceedingly severe, and advance with great rapidity, the patient passing into a state of extreme prostration. In the acute form of the disease recovery rarely if ever occurs, and the case generally terminates fatally in a period varying from two or three days to as many weeks.

A chronic form of glanders and farcy is occasionally met with, in which the symptoms, although essentially the same as those above described, advance much more slowly, and are attended with relatively less urgent constitutional disturbance. Cases of recovery from this form are on record; but in general the disease ultimately proves fatal by exhaustion of the patient, or by a sudden supervention, which is apt to occur, of the acute form. On the other hand, acute glanders is never observed to become chronic from it.

In the treatment of this malady in human beings reliance is mainly placed on the maintenance of the patient's strength by strong nourishment and tonic remedies. Cauterization should be resorted to if the point of infection is early known. Abscesses may be opened and antiseptic lotions used. In all cases of the outbreak of glanders it is of the utmost consequence to prevent the spread of the disease by the destruction of affected animals and the cleansing and disinfection of infected localities.

**Glanvill** (or Glanville), **Joseph** (1636–1686), English philosopher, was born at Plymouth in 1636, and was educated at Exeter and Lincoln colleges, Oxford, where he graduated as M.A. in 1658. After the Restoration he was successively rector of Wimbsam, Essex, vicar of Frome Selwood, Somersetshire, rector of Streat and Walton. In 1666 he was appointed to the abbey church, Bath; in 1678 he became prebendary of Worcester Cathedral, and acted as chaplain in ordinary to Charles II. from 1672. He died at Bath in November 1680. Glanvill's first work (a passage in which suggested the theme of Matthew Arnold's *Dover Beach*) is *The Vanity of Dogmatizing, or Confidence in Opinions, manifested in a Discourse of the Shortness and uncertainty of our Knowledge, and its Causes, with Reflections on Peripateticism, and an Apology for Philosophy* (1661), is interesting as showing one special direction in which the new method of the Cartesian philosophy might be developed. Pascal had already shown how philosophical scepticism might be employed as a bulwark for faith, and Glanvill follows in the same track. The philosophic endeavour to cognize the whole system of things by referring all events to their causes appears to him to be from the outset doomed to failure. For if we inquire into this causal relation we find that though we know isolated facts, we cannot perceive any such connexion between them as that the one should give rise to the other. In the words of Hume, "they seem conjoined but never connected." All causes then are but secondary, i.e., merely the occasions on which the one first cause operates. It is singular enough that Glanvill who had not only shown, but even exaggerated, the infirmity of human reason, himself provided an example of its weakness for having combated scientific dogmatism, he not only yielded to vulgar superstitions, but actually endeavoured to accredit them both in his revised edition of the *Vanity of Dogmatizing*, published as *Sceptic scitaens* (1665, ed. Rev. John Owen, 1885), and in his *Philosophical Considerations concerning the existence of Sorcerers and Sorcery* (1660).

The latter work appears to have been based on the story of the drum which was allaged to have been heard every night in a house in Wiltshire (Tedworth, belonging to a Mr Mompesson), a story which made much noise in the year 1663, and which is supposed to have furnished Addison with the idea of his comedy the *Drummer*. At his death Glanvill left a piece entitled *Sudducismus Triumphatus* (printed in 1681, reprinted with some additions in 1682, German trans. 1701). He had there collected twenty-six relations or stories of the same description as that of the drum, in order to establish, by a series of facts, the opinion which he had expressed in his *Philosophical Considerations*, that Glanvill supported a much more honourable cause when he undertook the defence of the Royal Society of London, under the title of *Plus Ultra*, or the Progress and Advancement of Science since the time was imbued with the ideas of the empirical method.

Besides the works already noticed, Glanvill wrote *Lux orientalis* (1662); *Philosophia pia* (1671); *Essay on Several Important Subjects in Philosophy and Religion* (1676); *An Essay concerning Preaching*; and *Sermons*. See C. Rémuazat, *Hist. de la phil. en Angleterre*, bk. iii. ch. 21.; W. E. H. Lecky, *Rationalism in Europe* (1865), i. 120-128; *Hallam's Literature of Europe*, iii. 358-362; Tulloch's *Rational Theology*, ii. 443-455.

**Glanvill, Ranulf de** (sometimes written *Glanvil*, *Glanville*) (d. 1190), chief justiciar of England and reputed author of a book on English law, was born at Stratford in Suffolk, but in what year is unknown. There is but little information concerning his early life. He first comes to the front as sheriff of Yorkshire from 1160 to 1165. In 1172 he became sheriff of Lancashire and custodian of the honour of Richmond. In 1174 he was one of the English leaders at the battle of Alnwick, and it was to him that the king of the Scots, William the Lion, surrendered. In 1175 he was reappointed sheriff of Yorkshire, in 1176 he became justice of the king's court and a justice itinerant in the northern circuit, and in 1180 chief justiciar of England. It was with his assistance that Henry II. completed his judicial reforms, though the principal of them had been carried out before he came into office. He became the king's right-hand man, and during Henry's frequent absences was in effect viceroy of England. After the death of Henry in 1189, Glanvill was removed from his office by Richard I., and imprisoned till he had paid a ransom, according to one authority, of £15,000. Shortly after obtaining his freedom he took the cross, and he died at the siege of Acre in 1190. At the instance, it may be, of Henry II., Glanvill wrote or superintended the writing of the *Tractatus de legibus et consuetudinibus regni Anglie*, which is a practical treatise on the forms of procedure which a man in court had to observe, and contains the earliest form of the *curia regis*, and for the information it affords regarding ancient customs and laws, it is of great value to the student of English history. It is now generally agreed that the work of Glanvill is of earlier date than the Scottish law book known from its first words as *Regiam Majestatem*, a work which bears a close resemblance to his.

The treatise of Glanvill was first printed in 1554. An English translation was made with notes and introduction by John Beaumont, and published at London in 1812. A French version is found in various MSS., but has not yet been printed. (See also ENGLISH LAW: History.)

**Glapthorne, Henry** (d. 1615-1642). English poet and dramatist, wrote in the reign of Charles I. All that is known of him is gathered from his own work. He published *Poems* (1639), many of them in praise of an unidentified "Lucinda"; a poem in honour of his friend Thomas Beccome, whose *Poems Divine and Humane* he edited in 1641; and *Whitehall* (1642), dedicated to his "noble friend and gossip, Captain Richard Lovelace." The first volume contains a poem in honour of the duke of York, and *Whitehall* is a review of the past glories of the English court, containing abundant evidences of the writer's devotion to the royal cause. *Argalus and Parthenia* (1639) is a pastoral tragedy founded on an episode in Sidney's *Arcadia*; *Albertus Wallenstein* (1639), his only attempt at historical tragedy, represents Wallenstein as a monster of pride and cruelty. His
other plays are The Hollander (written 1635; printed 1640), a romantic comedy of which the scene is laid in Genoa; Wil in a Constable (1640), which is probably a version of an earlier play, and the same author's Much Ado about Nothing and The Ladies Priviledge (1640). The Lady Mother (1653) has been identified (Fleay, Biog. Cron. of the Drama) with The Noble Trial, one of the plays destroyed by Warburton's cook, and Mr A. H. Bullen prints it in vol. ii. of his Old English Plays as most probably Glapthorne's work. The Parasite, or Revenge for Honour (1654), entered at Stationers' Hall in 1653 as Glapthorne's, was printed in the next year with George Chapman's name on the title-page. It should probably be included among Glapthorne's plays, which, though they hardly rise above the level of minor literary productions, contain many felicitous isolated passages.

The Plays and Poems of Henry Glapthorne (1874) contains an unsigned memoir, which, however, gives no information about the dramatist's life. There is no reason for supposing that the George Glapthorne of whose trial details are given was a relative of the poet.

GLARUS (Fr. Glaris), one of the Swiss cantons, the name being taken from that of its chief town. Its area is 266 sq. m., of which 173.1 sq. m. are classed as 'productive' (forests comprising 41 sq. m.), and it also contains 9 sq. m. or 3.4 per cent. of rankers, as the fifth Swiss canton in this respect. It is thus a mountain canton, the loveliest point in it being the Tödi (11,887 ft.), the highest summit that rises to the north of the upper Aar and Vorder Rhine valleys. It is composed of the upper valley of the Linth, that is the portion which lies to the south of a line drawn from the Lake of Zürich to the Walensee. This river rises in the glaciers of the Tödi, and has carved out for itself a deep bed, so that the floor of the valley is comparatively level, and therefore is occupied by a number of considerable villages. Glarus passes only lead from its head to the Grisons, save the rough footpath over the Kisten Pass, while a fine new carriage road over the Klausen Pass gives access to the canton of Uri. The upper Linth valley is sometimes called the Grossthal (main valley) to distinguish it from its chief (or south-eastern) tributary, the Sernf valley or Kleinthal, which joins it at Schwanden, a little above Glarus itself. At the head of the Kleinthal a mule track leads to the Grisons over the Panixer Pass, as also a foot-path over the Segnes Pass. Just below Glarus town, another glen (coming from the south-west) joins the main valley, and is watered by the Klon, while from its head the Praggel Pass (a mule path, converted into a carriage road) leads over to the canton of Schwyz. The Klon glen (uninhabited save in summer) is separated from the main glen by the fine fold mass of the Glärnisch (9380 ft.), while the Sernf valley is similarly cut off from the Grossthal by the high ridge running northwards from the Hausstock (10,342 ft.) over the Kärpfstock (9177 ft.). The principal lakes, the Klöntalersee and the Muttensee, are of a thoroughly Alpine character, while there are several fine waterfalls near the head of the main valley, such as those formed by the Sandbach, the Schreinenbach and the Fächbach. The Pантенбрücke, thrown over the narrow cleft formed by the Linth, is one of the grandest sights of the Alps below the snow-line. There is a sulphur spring at Stachelberg, near Linthal village, and an iron spring at Elm, while in the Sernf valley there are the Plattenberg slate quarries, and just south of Elm those of the Tschingelberg, whence a terrific landslide descended to Elm (11th September 1881), destroying many houses and killing 115 persons. A railway runs through the whole canton from north to south past Glarus to Linthal village (163 m.), while from Schwanden there is an electric line (opened in 1905) up to Elm (83 m.).

In 1900 the population of the canton was 32,349 (a decrease on the 33,825 of 1888, this being the only Swiss canton which shows a decrease), of whom 31,797 were German-speaking, while there were 24,493 Protestants, 7915 Romanists (many in Näfels) and 3 Jews. After the capital, Glarus (q.v.), the largest villages are Näfels (2557 inhabitants), Klontal (2404 inhabitants), opposite Glarus of which it is practically a suburb), Nettel (2005 inhabitants), Mollis (1912 inhabitants) and Linthal (1894 inhabitants). The slate industry is now the most important as the cotton manufacture has lately very greatly fallen off, this being the real reason of the diminution in the number of the population. There is little agriculture, for it is a pastoral region (owing to its height) and contains 87 mountain pastures (though the finest of all within the limits of the canton, the Urnerboden, or the Glarus side of the Klausen Pass, belongs to Uri), which can support 8054 cows, and are of an estimated capital value of about £246,000. One of the most characteristic products (though inferior qualities are manufactured elsewhere in Switzerland) is the cheese called Schafstuewe, Kräuterkäse, or green cheese, made of skim milk (Zieger or särze), whether of goats or cows, mixed with buttermilk and coloured with powdered Steinklee (Miltir officinale). The cheese is generally exported to the east.

The curds are brought down from the huts on the pastures, and, after being mixed with the dried powder, are ground in a mill, then put into shapes and shaped. The cheese thus produced is ripe in about a year, keeps a long time and is largely exported, even to America. The ice formed on the surface of the Klöntalersee in winter is stored up on its shore and exported. A certain number of visitors come to the canton in the summer, either to profit by one or other of the mineral springs mentioned below, or to enjoy the beauties of nature, especially at Obstalden, above the Walensee. The canton has one single administrative district and contains 28 communes. It sends to the Federal Ständerath 2 representatives (elected by the Landsgemeinde) and 2 also to the Federal Nationalrat.

The canton still keeps its primitive democratic assembly or Landsgemeinde (meeting annually in the open air at Glarus on the first Sunday in May), composed of all male citizens of 20 years of age. It acts as the sovereign body, so that no "referendum" is required, while any citizen can submit a proposal. It names the executive of 6 members, besides the Landammann or president, all holding office for three years. The communes (forming 18 electoral circles) elect for three years the Landrath, a sort of standing committee composed of members in the proportion of 1 for every 500 inhabitants or fraction over 250. The present constitution dates from 1887.

GLARUS (Fr. Glaris), the capital of the Swiss canton of the same name. It is a clean, modern little town, built on the left bank of the Linth (opposite it is the industrial suburb of Ennenda on the right bank), at the north-eastern foot of the imposing rock peak of the Vorder Glärnisch (7648 ft.), while on the east rises the Schild (6400 ft.). It now contains but few houses built before 1861, for on the 10/11 May 1861 practically the whole town was destroyed by fire that was fanned by a violent Föhn or south wind, rushing down from the high mountains through the natural funnel formed by the Linth valley. The total loss is estimated at about half a million sterling, of which about £500,000 were made up by subscriptions that poured in from every side. It possesses the broad streets and usual buildings of a modern town, the parish church being by far the most stately and well-situated building; it is used in common by the Protestants and Romans. Zwingli, the reformer, was parish priest here from 1506 to 1516, before he became a Protestant. The town is 1578 ft. above the sea-level, and in 1890 had a population of 4877, almost all German-speaking, while 2148 were Romanists. For the Linth canals (1811 and 1816) see LIENTHAL.

The District of Glarus is said to have been converted to Christianity in the 6th century by the Irish monk, Fróddin, whose special protector was St Hilary of Poitiers; the former was the founder, and both were patrons, of the Benedictine nunnery of Säckingen, on the Rhine between Constance and Basel, that about the 9th century became the owner of the district which was then named after St Hilary. The Habsburgs, protectors of the nunnery, gradually drew to themselves the exercise of all the rights of the nuns, so that in 1352 Glarus joined the Swiss Confederation. But the men of Glarus did not gain their complete independence, even back the Habsburgs in the glorious battle of Näfels (1388), the complement of Sempach, so that the Habsburgs gave up their rights.
in 1398, while those of Säckingen were bought up in 1395, on condition of a small annual payment. Glarus early adopted Protestantism, but there were many struggles later on between the two parties, as the chief family, that of Tschudi, adhered to the old faith. At last it was arranged that, besides the common Landsgemeinde, each party should have its separate Landsgemeinde (1623) and tribunals (1683), while it was not till 1798 that the Protestants agreed to accept the Gregorian calendar. The slate-quarrying industry appeared early in the 17th century, while cotton-spinning was introduced about 1714, and calico-printing by 1750. In 1798, in consequence of the resistance of Glarus to the French invaders, the canton was united to other districts under the name of canton of the Linth, though in 1803 it was reduced to its former limits. In 1799 it was traversed by the Russian army, under Suworoff, coming over the Pragel pass, but blocked by the French at Näfels, and so driven over the Panixer to the Grisons. The old system of government was set up again in 1814. But in 1836 by the new Liberal constitution one single Landsgemeinde was restored, despite the resistance (1837) of the Romanist population at Näfels.

GLAS, GEORGE (1725—1765), Scottish seaman and merchant adventurer in West Africa, son of John Glas the divine, was born at Dundee in 1725, and is said to have been brought up as a surgeon. He obtained command of a ship which traded between Brazil, the N.W. coasts of Africa and the Canary Islands.

During his voyages he discovered on the Sahara seaboard a river navigable for some distance inland, and here he proposed to found a trading station. The exact spot is not known for certain, but it is plausibly identified with Gueder, a place in about 20° 10' N., possibly the haven where the Spaniards had in the 15th and 16th centuries a fort called Santa Cruz de Mar Pequeña.

Glas made an arrangement with the Lords of Trade whereby he was granted £1,500 if he obtained free cession of the port he had discovered to the British crown; the proposal was to be laid before parliament in the session of 1765. Having chartered a vessel, Glas, with his wife and daughter, sailed for Africa in 1764, reached his destination and made a treaty with the Moors of the district. He navigated from the mouth of the river Hillsborough, after Wills Hill, earl of Hillsborough (succeeded marquis of Downshire), president of the Board of Trade and Plantations, 1763-1765. In November 1764 Glas and some companions, leaving his ship behind, went in the longboat to Lanzarote, intending to buy a small harque suitable for the navigation of the river on which was his settlement. From Lanzarote he forwarded to London the treaty he had concluded and the acquisition of Port Hillsborough. A few days later he was seized by the Spaniards, taken to the Cape, and imprisoned at Santa Cruz. In a letter to the Lords of Trade from Teneriffe, dated the 15th of December 1764, Glas said he believed the reason for his detention was the jealousy of the Spaniards at the settlement at Port Hillsborough "because from thence in time of war the English might ruin their fishery and effectually stop the whole commerce of the Canary Islands."
to him, thus constituting the first "Glassite" or "Glasite" church. The seat of this congregation was shortly afterwards transferred to Dundee (whence Glas subsequently removed to Edinburgh), where he officiated for some time as an "elder." He next laboured in Perth for a few years, where he was joined by Robert Sandeman (see GLASITES), who became his son-in-law, and eventually was recognized as the leader and principal exponent of Glas's views; these he developed in a direction which contributed largely to the change of antagonism. Ultimately in 1730 Glas returned to Dundee, where the remainder of his life was spent. He introduced in his church the primitive custom of the "osculum pactis" and the "agape" celebrated as a common meal with broth. From this custom his congregation was known as the "kail kirk." In 1739 the General Assembly, without any application from him, removed the sentence of deposition which had been passed against him, and restored him to the character and function of a minister of the gospel of Christ, but not that of a minister of the Established Church of Scotland, declaring that he was not eligible for a charge until he should have renounced principles inconsistent with the constitution of the church.

A collected edition of his works was published at Edinburgh in 1761 (4 vols., 8vo.), and again at Perth in 1782 (5 vols., 8vo). He died in 1773.

Glas, published works bear witness to his vigorous mind and scholarly attainments. His reconstruction of the True Discourse of Cæsærus (1753), from Origen's reply to it, is a competent and learned piece of work. The Testimonies of the Martyrs concerning the Kingdom (1729) is a classic repudiation of erastianism and defence of the spiritual autonomy of the church under Jesus Christ. His common sense appears in his rejection of Hutchinson's attempt to prove that the Bible supplies a complete system of physical science, and his shrewdness in his Notes on Scripture Texts (1747). He published a volume of Christian Songs (Perth, 1784). (D. M. N.)

GLASER, CHRISTOPHER, a pharmaceutical chemist of the 17th century, was a native of Basel, became demonstrator of chemistry at the Jardin du Roi in Paris and apothecary to Louis XIV, and to the duke of Orleans. He is best known by his Traité de la chimie (Paris, 1663), which went through some ten editions in about five-and-twenty years, and was translated into both German and English. It has been alleged that he was an accomplice in the notorious poisonings carried out by the marchioness de Brinvilliers, but the extent of his complicity is doubtful. He appears to have died some time before 1676.

The sal polychestrum Glaser is normal potassium sulphate which he prepared and used medicinally.

GLASGOW, a city, county of a city, royal burgh and port of Lanarkshire, Scotland, situated on both banks of the Clyde, 4013 m. N.W. of London by the West Coast railway route, and 47 m. W.S.W. of Edinburgh by the North British railway. The valley of the Clyde is closely confined by hills, and the city extends far over these, the irregularity of its site making for picturesqueness. The commercial centre of Glasgow, with the majority of important public buildings, lies on the north bank of the river, which traverses the city from W.S.W. to E.N.E., and is crossed by a number of bridges. The uppermost is Dalmarnock Bridge, dating from 1801, and next below it is Rutherglen Bridge, rebuilt in 1896, and superseding a structure of 1775. St. Andrew's suspension bridge gives access to the Green to the inhabitants of Hutchesontown, a district which is approached also by Albert Bridge, a handsome erection, leading from the Saltmarket. Above this bridge is the tidal dam and weir. Victoria Bridge, of granite, was opened in 1836, taking the place of the venerable bridge erected by Bishop Rae in 1345, which was demolished in 1837. Then follows a suspension bridge (dating from 1835) by which foot-passengers from the south side obtain access to St. Enoch Square and, finally, the most important bridge of all is reached, variously known as Glasgow, Jamaica Street, and Stockbridge. The suspension bridge, built of granite, is Gallochton design and first used in 1835. Towards the close of the century it was reconstructed, and reopened in 1890. At the busier periods of the day it bears a very heavy traffic. The stream is spanned between Victoria and Albert Bridges by a bridge belonging to the Glasgow & South-Western railway and by two bridges carrying the lines of the Caledonian railway, one below Dalmarnock Bridge and the other a massive work immediately west of Glasgow Bridge.

Buildings.—George Square, in the heart of the city, is an open space of which every possible advantage has been taken. On its eastern side stand the municipal buildings, a palatial pile in Venetian Renaissance style, from the designs of William Young, a native of Paisley. They were opened in 1889 and cost nearly £600,000. The front of a square block four storeys high and carry a domed turret at each end of the western façade, from the centre of which rises a massive tower. The entrance hall and grand staircase, the council chamber, banqueting hall and reception rooms are decorated in a grandiose style, not unbecoming to the commercial and industrial metropolis of Scotland. Several additional blocks have been built or rented for the accommodation of the municipal staff. Admiringly equipped sanitary chambers were opened in 1897, including a bacteriological and chemical laboratory. Up till 1810 the town council met in a hall adjoining the old tolbooth. It then moved to the fine classical structure at the foot of the Saltmarket, which is now used as court-houses. This was vacated in 1842 for the county buildings in Wilson Street. Growth of business compelled another migration to Ingram Street in 1875, and, fourteen years later, it occupied its present quarters. On the southern side of George Square the chief structure is the massive General Post Office. On the western side stand two ornate Italian buildings, the Bank of Scotland and the Merchants' House, the latter (the building of gild), along with the head of the Trades' House (the deacon-preserver of trades) has been de facto a member of the town council since 1711, an arrangement devised with a view to adjusting the frequent disputes between the two gilds. The Royal Exchange, a Corinthian building with a fine portico of columns in two rows, is an admired example of the work of David Hamilton (1768-1843), a native of Glasgow, who designed several of the public buildings and churches, and gained the second prize for a design for the Houses of Parliament. The news-room of the exchange is a vast apartment, 130 ft. long, 60 ft. wide, 130 ft. high, with a richly-decorated roof supported by Corinthian pillars. Buchanan Street, the most important and handsome street in the city, contains the Stock Exchange, the Western Club House (by David Hamilton) and the offices of the Glasgow Herald. In Sauchiehall Street are the Fine Art Institute and the former Corporation Art Gallery. Argyll Street, the busiest thoroughfare, mainly occupied with shops, leads to Trongate, where a few remains of the old town are now carefully preserved. On the south side of the street, spanning the pavement, stands the Tron Steeple, a stunted spire dating from 1345. It is all that is left of St. Mary's church, which was burned down in 1793 during the revolts of a notorious body known as the Hell Fire Club. On the opposite side, at the corner of High Street, stood the ancient tolbooth, or prison, a turreted building, five storeys high, with a fine Jacobean crown tower. The only remnant of the structure is the tower known as the Cross Steeple.

Although almost all the old public buildings of Glasgow have been swept away, the cathedral remains in excellent preservation. It stands in the north-eastern quarter of the city at a height of 104 ft. above the level of the Clyde. It is a beautiful example of Early English work, impressive in its simplicity. Its form is that of a Latin cross, with imperfect transepts. Its length from east to west is 310 ft., and its width 63 ft.; the height of the choir is 93 ft., and of the nave 85 ft. At the centre rises a fine tower, with a short octagonal spire, 225 ft. high. The choir, locally known as the High Church, serves as one of the city churches, and the extreme east end of it forms the Lady chapel. The rich western doorway is French in design but English in details. The chapter-house is separated from the north-eastern corner and somewhat mars the harmony of the effect. It was built in the 15th century and has a groined roof supported by a pillar 20 ft. high. Many citizens have contributed towards filling the windows with stained glass, executed at Munich, the government providing the eastern
window in recognition of their enterprise. The crypt beneath the choir is not the least remarkable part of the edifice, being without equal in Scotland. It is borne on 65 pillars and lighted by 41 windows. The sculpture of the capitals of the columns and bosses of the groined vaulting is exquisite and the whole is in excellent preservation. Strictly speaking, it is not a crypt, but a lower church adapted to the sloping ground of the right bank of the Molendinar burn. The dripping aisle is so named from the constant dropping of water from the roof. St Mungo's Well in the south-eastern corner was considered to possess therapeutic virtues, and in the crypt a recumbent effigy, headless and handleless, is faithfully accepted as the tomb of Kentigern. The cathedral contains few monuments of exceptional merit, but the surrounding graveyard is almost completely paved with tombstones. In 1115 an investigation was ordered by David, Prince of Cumbria, into the lands and churches belonging to the bishopric, and from the deed then drawn up it is clear that at that date a cathedral had already been endowed. When David ascended the throne in 1124 he gave to the see of Glasgow the lands of Partick, besides restoring many possessions of which it had been deprived. Jocelin (d. 1190), made bishop in 1174, was the first great bishop, and is memorable for his efforts to replace the cathedral built in 1136 by Bishop John Achalus, which had been destroyed by fire. The crypt is his work, and he began the choir, Lady chapel, and central tower. The new structure was sufficiently advanced to be dedicated in 1197. Other famous bishops were Robert Wishart (d. 1316), appointed in 1272, who was among the first to join in the revolt of Wallace, and received Robert Bruce when he lay under the ban of the church for the murder of Comyn; John Cameron (d. 1446), appointed in 1428, under whom the building as it stands was completed; and William Turnbull (d. 1454), appointed in 1447, who founded the university in 1459. James Beaton or Bethune (1517–1603) was the last Roman Catholic archbishop. He fled to France at the reformation in 1560, and took with him the treasures and records of the see, including the Red Book of Glasgow dating from the reign of Robert III. The documents were deposited in the Scots College in Paris, were sent at the outbreak of the Revolution for safety to St Omer, and were never recovered. This loss explains the paucity of the earlier annals of the city. The zeal of the Reformers led them to threaten to mutilate the cathedral, but the building was saved by the prompt action of the craftsmen, who mustered in force and dispersed the fanatics.

Excepting the cathedral, none of the Glasgow churches possesses historical interest; and, speaking generally, it is only the buildings that have been erected since the beginning of the 19th century that have pronounced architectural merit. This was due largely to the long survival of the severe sentiment of the Covenanters, who, discouraged, if they did not actually forbid, the raising of temples of beautiful

design. Representative examples of later work are found in the United Free churches in Vincent Street, in Caledonia Road and at Queen's Park, designed by Alexander Thomson (1817-1875), an architect of distinct originality; St George's church, in West George Street, a remarkable work by William Stark, erected in the beginning of the 19th century; St Andrew's church in Anderton Street, completed only in 1875; the St Martin's-in-the-Fields, London, with a fine Roman portico; some of the older parish churches, such as St Enoch's, dating from 1780, with a good spire (the saint's name is said to be a corruption of Tanew, mother of Kentigern); the episcopal church of St Mary (1789), in Great Western Road, by Sir G. G. Scott; the Roman Catholic cathedral of St Andrew, on the river-bank between Victoria and Broomielaw bridges; the Barony church, replacing the older kirk in which Norman Macleod ministered; and several admirable structures, well situated, on the eastern confines of Kelvingrove Park.

The principal burying-ground is the Necropolis, occupying Fir Park, a hill about 300 ft. high in the northern part of the city. It provides a not inappropriate background to the cathedral, from which it is approached by a bridge, known as the "Bridge of Sighs," over the Molenindar ravine. The ground, which once formed portion of the estate of Wester Craigie, belongs to the Merchants' House, which purchased it in 1650 from Sir Ludovic Stewart of Minto. A Doric column to the memory of Knox, surmounted by a colossal statue of the reformer, was erected by public subscription on the crown of the height in 1824, and a few years later the idea arose of utilizing the land as a cemetery. The Jews have reserved for their own people a detached area in the north-western corner of the cemetery.

Education.—The university, founded in 1450 by Bishop Turnbull under a bull of Pope Nicholas V., survived in its old quarters till far in the 19th century. The paedagogium, or college of arts, was at first housed in Rottenrow, but was moved in 1460 to a site in High Street, which James Hamilton of Cadzow, first Lord Hamilton, gave it forty acres of land and some buildings. Queen Mary bestowed upon it thirteen acres of contiguous ground, and her son granted it a new charter and enlarged the endowments. Prior to the Revolution its fortunes fluctuated, but in the 18th century it became very famous. By the middle of the 19th century, however, its surroundings had deteriorated, and in 1850 it was decided to rebuild it elsewhere. The ground had enormously increased in value and a railway company purchased it for £100,000. In 1864 the university bought the Gilmore Hill estate for £65,000, the adjacent property of Dowan Hill for £16,000 and the property of Clayslips for £17,400. Sir G. G. Scott was appointed architect and selected as the site of the university buildings the ridge of Gilmore Hill—the finest situation in Glasgow. The design is Early English with a suggestion in parts of the Scots-French style of a much later period. The main structure is 540 ft. long and 300 ft. broad. The principal façade faces southwards and consists of a lofty central tower with spire and corner blocks with turrets, between which are buildings of lower height. Behind the tower lies the Bute hall, built on cloisters, binding together the various departments and smaller halls, and dividing the massive edifice into an eastern and western quadrangle, on two sides of which are ranged the class-rooms in two stores. The northern façade comprises two corner blocks, besides the museum, the library and, in the centre, the students' reading-room on one floor and the Hunterian museum on the floor above. On the south the ground falls in terraces towards Kelvingrove Park and the Kelvin. On the west, but apart from the main structure, stand the houses of the principal and professors. The foundation stone was laid in 1868 and the opening ceremony was held in 1870. The total cost of the university buildings amounted to £500,000, towards which government contributed £110,000 and public subscription £250,000. The third marquess of Bute (1847-1900) gave £40,000 to provide the Bute or common hall, a room of fine proportions fitted in Gothic style and divided by a beautiful Gothic screen from the Randolph hall, named after another benefactor, Charles Randolph (1809-1878), a native of Stirling, who had prospered as shipbuilder and marine engineer and left £60,000 to the university. The graceful spire surmounting the tower was provided from the bequest of £5000 by Mr A. Cunningham, deputy town-clerk, and Dr John M'Intyre erected the Students' Union at a cost of £5000, while other donations provided sums for a number of auxiliary buildings which was enabled to carry on its work, for the first time in its history, in almost ideal circumstances. The library includes the collection of Sir William Hamilton, and the Hunterian museum, bequeathed by William Hunter, the anatomist, is particularly rich in coins, medals, black-letter books and anatomical preparations. The observatory on Dowan Hill is attached to the chair of astronomy. An interesting link with the past are the exhibitions founded by John Snell (1629-1679), a native of Colmonell in Ayrshire, for the purpose of enabling students of distinction to continue their career at Balliol College, Oxford. Amongst distinguished exhibitioners have been Adam Smith, John Gibson Lockhart, John Wilson ("Christopher North"), Archbishop Tait, Sir William Hamilton and Professor Shairp. The curriculum of the university embraces the faculties of arts, divinity, medicine, law and science. The governing body includes the chancellor, elected for life by the general council, the principal, also elected for life, and the lord rector elected triennially by the students voting in "nations" according to the number of members at the University. There are the "Foras" (the shires of Bute, Renfrew and Ayr; and Londonderry, all others). There are a large number of well-endowed chairs and lectureships and the normal number of students exceeds 2000. The universities of Glasgow and Aberdeen unite to return one member to parliament. Queen Margaret College for women, established in 1853, occupies a handsome building close to the botanic garden, has an endowment of upwards of £25,000, and was incorporated with the university in 1893. Muirhead College is another institution for women.

Elementary instruction is supplied at numerous board schools. Higher secondary and technical education is provided at several well-known institutions. There are two educational endowments boards which apply a revenue of about £10,000 a year mainly to the foundation of bursaries. Anderson College in George Street perpetuates the memory of its founder, John Anderson (1726-1796), professor of natural philosophy in the university, who opened a class in physics for working men, which he conducted to the end of his life. By his will he made provision for a lecture room for the instruction of artisans and others unable to attend the university. The college which bears his name began in 1796 with lectures on natural philosophy and chemistry by John Garnett (1765-1802). Two years later mathematics, geography and the law of property were added. In 1799 Dr George Birkbeck (1776-1841) succeeded Garnett and began those lectures on mechanics and applied science which continued elsewhere, ultimately led to the foundation of several technical institutions throughout Scotland. The college was further endowed and its curriculum enlarged by the inclusion of literature and languages, but ultimately it was determined to limit the scope of its work to medicine (comprising, however, physics, chemistry and botany also). The lectures of its medical school, incorporated in 1887 and situated near the Western Infirmary, are accepted by Glasgow and other universities. The Glasgow and West of Scotland Technical College, formed in 1886 out of a combination of the arts side of Anderson College, the College of Science and Arts, Allan Glen's Institution and the Atkinson Institution, is especially concerned with the education of engineers and is particularly concerned with students desirous of following an industrial career. St Mungo's College, which has developed from an extra-mural school in connexion with the Royal Infirmary, was incorporated in 1880, with faculties of medicine and law. The United Free Church College, finely situated near Kelvingrove Park, the School of Art and Design, and the normal schools for the training of teachers are institutions with which the university is associated.

The High school in Elmbank is the successor of the grammar school (long housed in John Street) which was founded in the 14th century as an appanage of the cathedral. It was placed under the jurisdiction of the society in 1875. The schools include Glasgow Academy, Kelvinside Academy and the girls' and boys' schools endowed by the Hutcheson trust. Several of the schools under the board are furnished with secondaries or equipped as scientific schools, and the Roman Catholics maintain elementary schools and advanced academies.

Art Galleries, Libraries and Museums.—Glasgow merchants and
manufacturers alike have been constant patrons of art, and their liberality may have had some influence on the younger painters who, towards the close of the 19th century, broke away from tradition and, steadfastly refusing to be fettered by the control of this school, established the "Glasgow school." The art gallery and museum in Kelvin- grove Park, which was built at a cost of £250,000 (partly derived from the profits of the exhibitions held in the park in 1888 and 1890), is one of the largest and most thorough going in the work of the purchases of art belonging to Archibald McLean, and was supplemented from time to time by numerous bequests of important pictures by Sir George S. R. The gallery was opened in 1897, and combines an art gallery and museum with a conservatory and winter garden, and in the museum at Camphill, situated within the bounds of Queen's Park, the livestock and agricultural museum of the city are mostly reserved for the use of students.

The faculty of procurators possess a valuable library which is housed in their hall, an Italian Renaissance building, in West George Street. In Bath Street there are the Mechanics and the Philosophical Society's libraries, and the Physicians' is in St Vincent Street. Miller Street contains the headquarters of the public libraries. The premises once occupied by the water commission have been converted to house the Mitchell library, which grew out of a bequest of £700 by Stephen Mitchell, largely reinforced by further gifts of libraries and funds, and now contains upwards of 100,000 volumes. It is government buildings, the offices of the Glasgow Corporation, the public baths, the public library, and the Tomlinson building in this street accommodates both the Stirling and Baillie libraries. The Stirling, with some 50,000 volumes, is particularly rich in tracts of the 18th and 19th centuries, and the Baillie endowment in 1863, gave £18,000 for educational objects. The Athenaeum in St George's Place, an institution largely concerned with evening classes in various subjects, occupies a mansion house in this street.

Charities.—The Old Royal Infirmary, designed by Robert Adam and opened in 1794, adjoins the cathedral, occupies the site of the archbishopiscopal palace, the last portion of which was removed towards the close of the 18th century. The chief architectural feature of the infirmary is the central dome forming the roof of the operating theatre. On the northern side are the buildings of the medical college, one of the corner ones of which contains the Diamond Jubilee of Queen Victoria. A little farther north in the city, is the blind asylum. The Western Infirmary is to some extent used for the purposes of clinical instruction in connection with the university, to which it stands in immediate proximity. Near it is the Royal hospital for sick children. To the south of Queen's Park is Victoria Infirmary, and close to it the deaf and dumb institution. On the bank of the river, not far from the south-eastern boundary of the city, is the Belvedere hospital for infectious diseases, and at Ruthill, in the north, is another hospital of the same character opened in 1900. The Royal asylum at Garnival is situated near John Moss House (a high street branch at West Mucktoss) lies in the parish of Cadder beyond the north-eastern boundary. There are numerous hospitals exclusively devoted to the treatment of special diseases, and several nursing homes of the same character. The Victoria, designed by Hamilton and adorned with statues of the founders, is situated in Ingram Street, and by the increase in the value of its lands has become a very valuable property. The London & North Western Railway, and the Trongate near the tolbooth, who afterwards lived in the Bishop's castle, which stood close to the spot where the Kelvin enters the Clyde, founded the hospital for poor old men. His brother Thomas (1589-1641) established in connection with it a school for the lodging and education of orphan boys, the sons of burgesses. The trust, through the growth of its funds, has been enabled to extend its educational scope and to subsidize schools apart from the charity.

Monuments.—Most of the statues have been erected in George Square. They are grouped around a fluted pillar 80 ft. high, surmounted by a colossal statue of Sir Walter Scott by John Ritchie (1895). The statue was cast in England according to a cast by the Prince Consort (both equestrian) by Baron Marochetti; James Watt by Chantrey; Sir Robert Peel, Thomas Campbell the poet, who was born in 1775, by P. H. Gilbert Scott; Sir John Moore, a native of Glasgow, by Flaxman, erected in 1819; James Oswald, the first member returned to parliament for the city after the Reform Act of 1832; Lord Clyde (Sir Colin Campbell), also a member of the house of lords, by F. W. Petherick. Dr Thomas Graham, master of the mint, another native, by Brodie; Robert Burns by G. E. Ewing, erected in 1877, subscribed for in shillings by the working men of Scotland, and William Ewart Gladstone by Hamo Thornycroft. The Royal Exchange stands the equestrian monument of the duke of Wellington. In Cathedral Street are the statues of Norman Maclean and Sir John Smith, and that of the duke of Atholl. The infirmary is that of Sir James Lumsden, lord provost and benefactor. Nelson is commemorated by an obelisk 143 ft. high on the Green, which was erected in 1806 and is said to be a copy of that in the Piazza del Popolo at Rome. One of the most famous statues is the equestrian figure of William III, in the Trongate, which was presented to the town in 1735 by James Macrae (1672-1744), a poor Ayrshire lad who had amassed a fortune in India, where he was governor of Mumbai from 1725 to 1731.

Recreations.—Of the theatres the chief are the King's in Bath Street, the Royal and the Grand in Cowcaddens, the Royalty and Windmill in Sauchiehall Street, and the excitable in the West End. A large variety of music halls and vaudeville theatres are throughout the football grounds of the Queen's Park, the leading amateur club, and the Celtic, the Rangers, the Third Lanark and other prominent professional clubs.

The greatest open space is the Green (140 acres), on the right bank of the river, adjoining a densely populated district. It once extended farther west, but a portion was built over at a time when public rights were not vigilantly guarded. It is a favourite area for public demonstrations, and sections have been reserved for recreation or laid out in flower-beds. Kelvingrove Park, in the west end, has exceptional advantages, for the Kelvin burn flows through it and the ground is naturally terraced, while the situation is beautified by the adjoining Gilmore Hill with the university on its summit. The park was laid out under the direction of Sir Joseph Paxton, and contains the Stewart fountain, the statues of the occupants of Sauchiehall Street and the corporation, and his colleagues in the promotion of the Loch Katrine waterscheme. The other parks on the right bank are, in the north, Ruthill (33 acres), opened in 1898; (53 acres), opened in 1882, and, in the east, Alexandra Park (120 acres), in which is laid down a nine-hole golf-course, and Tollcross (82 acres), beyond the municipal boundary, acquired in 1897. On the left bank Queen's Park (45 acres), commanded by the statue of Joseph Paxton, and considerably enlarged in 1894 by the enclosure of the grounds of Camphill. The southern parks are Richmond (44 acres), opened in 1898, and named after Lord Provost Sir David Maxwell, who opened it in 1890; Maxwell, which was taken over on the annexation of Pollokshields in 1891; Bellahouston (176 acres), acquired in 1895; and Cathkin Brs (36 acres), acquired in 1901, all of which are devoted to the Royal Botanic Garden, which became public property in 1891. They are beautifully laid out, and contain a great range of hothouses. The gardens owed much to Sir William Hooker, who was regius professor of botany at Glasgow University before his appointment to the directorship of Kew Gardens.

Communications.—The North British railway terminus is situated in North Queen Street, and is connected with the city by a low-level station, used in connection with the city & District line, largely underground, serving the northern side of the town, opened in 1886. The Greenwich & Marylebone line, which runs on the high-level line of the N.B.R., the three companies forming the East Coast Joint Service. The Central terminus of the Caledonian railway in Gordon Street, served by the West Coast system (in connection with the G.W.R. and the Caledonian Railway Company) is a high-level station for the main line traffic and a low-level station for the Cathcart District railway, completed in 1886 and made circular for the southern side and suburbs in 1894, and also for the connection between Marvhill and Rutherglen, which is mostly underground. Both the underground lines communicate with certain branches of the main line, either directly or by change of carriage. The other terminus of the Caledonian railway in Buchanan Street now takes the northern and eastern traffic. The terminus of the Glasgow & South-Western railway company in St Enoch Square serves the country indicated in its title, and also gives the Midland Main Line a connection with the city. The Glasgow Subway—an underground cable passenger line, 6j. m. long, worked in two tunnels and passing below the Clyde twice—was opened in 1896. Since its opening the Johnstone Tunnel, built to pass the western edge of the railway bridge at the Bro morela, there are at certain points steam ferry boats or floating bridges for conveying vehicles across the harbour, and at Stobcross there is a subway for foot and wheeled traffic. Steamers, carrying both goods and passengers, constantly leave the Bro morela ferry for the piers and ports on the river and firth, and the islands and sea lochs of Arran, Islay. The city is admirably served by trams, which electrify, partly under the control of the city, partly by Glasgow and Albert bridges.

Trade.—Natural causes, such as proximity to the richest field of coal and ironstone in Scotland and the vicinity of hill streams of pure water, are the main advantages for the industrial enterprise of Glasgow. It was in textiles that the city showed its earliest predominance, which, however, has not been maintained, owing, it is alleged, to the shortage of female labour. Several cotton mills are still worked, but the leading feature in the trade has always been the manufacture
of such light textures as plain, striped and figured muslins, gingham and fancy fabrics. Thread is made on a considerable scale, but jute and hemp are comparatively negligible. A large variety of carpets are woven. Some factories are exclusively devoted to the making of lace curtains. The allied industries of bleaching, printing and dyeing, on the other hand, have never developed beyond the small scale, and the British woolen manufactory in Great Britain at Glasgow in 1877, on the suggestion of James Watt, whose father-in-law was a bleacher; and it was a Glasgow bleacher, Cunningham, who did the bleaching with nitric acid (chloride of lime). Turkey-red dyeing was begun at Glasgow by David Dale and George M'Intosh, and the colour was long known locally as Dale's red. A large quantity of grey cloth continues to be seen in the mills, most of it is made in the Clyde district, and the Scottish works. These industries gave a powerful impetus to the manufacture of chemicals, and the works at St Rollox developed rapidly. Among prominent chemical works are the producers of soda ash, soda-baking powder and soap-making—the preparation of alum and prussates of potash, bichromate of potash, white lead and other pigments, dynamite and gunpowder. Glass-making and paper-making were also carried on, and there are several breweries and distilleries, besides factories for the making of aerated waters, starch, dynamite and matches. Many miscellaneous trades flourish, such as clothing, confectionery, cabinet-making, bread and biscuit making, boot and shoe making, flour mills and saw mills, pottery and indiarubber. Since the days of the brothers Robert Foulis (1705-1776) and Andrew Foulis (1713-1768), and of the letterpress printer, has been carried on with Glasgow, though in a lesser degree than with Edinburgh.

The tobacco trade still flourishes, though much lessened. But the great industry is iron-founding. The discovery of the value of blast furnaces and the then reckless spirit of competition, was once due to David Mushet (1722-1847), and Neilson's invention of the hot-air blast threw the control of the Scottish iron trade into the hands of Glasgow. In the middle of the century steel furnaces were erected in Lanarkshire and Ayrshire. The expansion of the industry was such that in 1859, one-third of the total output in the United Kingdom was Scottish. During the following years, however, the trade seemed to have lost its elasticity, the annual production, averaging about one million tons of pig-iron. Mild steel is manufactured extensively, and some crucible cast steel is made. In addition to brass and copper there are works for the extrusion of copper and the smelting of lead and zinc. With such resources every branch of engineering is well represented. Locomotives are built for every country where railways are employed, and all kinds of building materials used in enormous quantities. Steel factories in the neighbourhood are important. Boilermaking and marine engine works, in many cases in direct connexion with the shipbuilding yards, are numerous. Shipbuilding, indeed, in the greatest of the industries of Glasgow, and in some years more than half of the total tonnage in the United Kingdom has been launched on the Clyde, the yards from which extend from the harbour to Dumbarton on one side and Greenock on the other side of the river and from. Exceeding a trifling proportion of wooden ships, the Clyde-built vessels are of iron and steel, the trade having owed its immense expansion to the prompt adoption of this material. Every vessel that goes out to sea is an export which is freighted with ships. In 1874 that at Pointhouse was the last one to pass through the mouth of the Kelvin, the depth at low water was only 15 ft. and at high water 39 ft. The transformation effected within a century and a half is due to the energy and enterprise of the Clyde Navigation Company, which in 1815 was incorporated in Ayrshire, but lightering was tedious and land carriage costly, and in 1858 the civic authorities endeavoured to purchase a site for a spacious harbour at Dumbarton. Being thwarted by the magistrates of that burgh, however, in 1862 they secured 13 acres on the southern bank at a spot some 2 m. above Greenock, which became known as Port Glasgow, where they built harbours and constructed the first great and magnificent Clyde docks, the first discovery of which was built, but it was not until the tobacco merchants appreciated the necessity of bringing their wares into the heart of the city that serious consideration was paid to schemes for deepening the waterway, and the plan of a £1.75 million scheme, as proposed by John Broomielaw was happily not accepted. In 1768 John Golborne advised the narrowing of the river and the increasing of the scour by the purchase of the land of the two tributary jetris or wires, the Struan and the Shin. The price was fixed at £1,050, but was undertaken 13 m. west of the lower end of Loch Arkel, designed to create a sheet of water 21 m. long and to increase the water-supply of the city by ten million gallons a day. The water committee appointed for the survey of the Clyde and its branches in 1809 the corporation acquired the gasworks, the productive capacity.
of which exceeds 70 million cub. ft. a day. In 1893 the supply of electric light was also undertaken, and since that date the city has been partly lighted by electricity. The corporation also laid down the plan for the construction of a gas works for twenty years at a rental of £150 a mile per annum. When the lease expired in 1894 the town council took over the working of the cars, substituting overhead electric traction for horse-power. One of the most difficult and expensive of the corporation schemes was to deal with was the housing of the poor. By the lapse of time and the congestion of population, certain quarters of the city, in old Glasgow especially, had become overcrowded districts. By the early 1890's there was a condition of the town was rapidly growing into a byword; when the municipality obtained parliamentary powers in 1866 enabling it to condemn for purchase over-crowded districts, to borrow money from the National Debt, the level of rents was raised, and the demolition of 10,000 insanitary dwellings occupied by 50,000 persons, but the corporation was required to provide accommodation for the dislodged tenants. In point of fact, the new houses needed to build, as private enterprise more than kept pace with the operations of the improvement. The work was carried out promptly and effectively, and when the act expired in 1881 whole localities had been recreated and nearly 40,000 persons properly housed. Under the amending act of 1881 the corporation began in 1888 to build tenement houses in which the poor could rent one or more rooms at the most moderate rentals; lodging-houses for men and women followed, and in 1896 a home was erected for the accommodation of families in certain circumstances. The powers of the improvement trustees were practically exhausted in 1896, when it appeared that in the work up to that date 55,450 had been spent on building and improving land and buildings, and £351,000 in building tenements and lodgings-houses; while, on the other side, ground that had been sold for £1,672,084 in ten years, the rents obtained proved insufficient, showing a deficiency of £433,050. Assessment of ratepayers for the purposes of the trust had yielded £393,000, and it was estimated that these operations, beneficial to the ratepayers, had resulted in a net gain to them of £24,400.

In 1897 an act was obtained for dealing in similar fashion with insanitary and congested areas in the centre of the city, and on the south side of the river, and for acquiring not more than the whole, within or without the city, for dwellings for the poorest classes. Along with these later improvements the drainage system was entirely remodelled, the area being divided into three sections, each of which works for the development of its own area. One section (authorized in 1891 and doubled in 1901) comprises 11 sq. m.—one-half within the city north of the river, and the other in the district in Lanarkshire—with works at Dalnhamock; another section (authorized in 1898) includes the area on the north bank not provided for in 1891, as well as the burghs of Partick and Clydebank and the area of the shires of Renfrew and Dumbarton, the area also comprising 14 sq. m., with works at Dalmuir, 7 m. below Glasgow; and the third section (authorized in 1898) embraces the whole municipal area on the south side of the river, the burghs of Rutherglen, Pollokshaws, Kinning Park and Govan, and a large area in the counties of Renfrew and Lanark, 54 sq. m. in all, which may be extended by the inclusion of the burghs of Renfrew and Paisley—with works at BrROLSF, 1 m. east of Renfrew. The increased interests that the city had mentioned its representation on the board of the Clyde Navigation Trust and the governing body of the West of Scotland Technical College. In respect of parliamentary representation the Reform Act of 1867, which came into force in 1868, increased the members of the city from 29 to 33, and in 1885 the city was split up into seven divisions, each returning one member. Population.—Throughout the 19th century the population grew prodigiously. Only 77,285 in 1801, it was nearly doubled in twenty years, being 147,043 in 1821, already outstanding Edinburgh. It had become 395,503 in 1861, and in 1881 it was 511,415. In 1891, prior to the account of the boundary, it was 565,839, and in 1901, 658,198, and in 1901 it stood at 761,709. The birth-rate averages 33, and the death-rate 21 per 1000, but the mortality before the city improvement scheme was carried out was as high as 33 per 1000. Access from foreign lands, a very considerable number of Gaelic-speaking persons live in Glasgow, while the great industries attract an enormous number of persons. The rate of population of the city, which in 1878–1879 was £3,420,697, now exceeds £5,000,000.

History.—There are several theories as to the origin of the name of Glasgow. One holds that it comes from Glaes, meaning "dark glen," descriptive of the narrow ravine through which the Molendinar flowed to the Clyde. But the more generally accepted version is that the word is the Celtic C lexh u, afterwards written Glisco or Glashu, meaning "dark green spot" (glas, green; cu or ghu, dear), which is supposed to have been the name of the settlement that Kentigern found here when he came to convert the Britons of Strathclyde. Mungo became the patron-saint of Glasgow, and the motto and arms of the city are wholly identified with him—"Let Glasgow Flourish by the Preaching of the Word," usually shortened to "Let Glasgow Flourish." It is not till the 12th century, however, that the history of the city becomes clear. About 1178 William the Lion made the town by charter a burgh of barony, and it gave it a market with freedom and customs. Amongst more or less isolated episodes of which record has been preserved may be mentioned the battle of Baillie of Milnathort, in which Wallace routed the English under Percy in 1300; the betrayal of Wallace to the English in 1305 in a barn situated, according to tradition, in Robroyston, just beyond the north-eastern boundary of the city; the ravages of the plague in 1350 and thirty years later; the regent Arran's siege, in 1544, of the bishop's castle, garrisoned by the earl of Glencairn, and the subsequent fight at the Butts (now the Gallowgate) where the terms of surrender were dis honoured, in which the regent's men gained the day. Most of the inhabitants were opposed to Queen Mary and many actively supported Murray in the battle of Langside—the site of which is now occupied by the Queen's Park—on the 13th of May 1568, in which she lost crown and kingdom. A memorial of the conflict was erected on the site in 1887. Under James VI. the town became a royal burgh in 1566, with freedom of the river from the Broomielaw to the Cloch. But the efforts to establish episcopacy aroused the fervent anti-priestly sentiment of the people, who made common cause with the Covenanters to the end of their long struggle. Montrose mutilated the city, and thirty years later the provost and bailies were deposed for contumacy to their sovereign lord. Plague and famine devastated the town in 1649, and in 1652 a conflagration laid a third of the burgh in ashes. Even after the restoration its sufferings were acute. It was the headquarters of the Whigamores of the west and its prisons were constantly filled with rebels for conscience' sake. The government scourged the townsfolk with an army of Highlanders, whose brutality only served to strengthen the resistance at the battles of Drumclog and Bothwell Brig. With the Union, hastily resented as it was at the dawn of almost unbroken prosperity arose. By the treaty of Union Scottish ports were placed, in respect of trade, on the same footing as English ports, and the situation of Glasgow enabled it to acquire a full share of the ever-increasing Atlantic trade. Its commerce was already considerable and in population it was now the second town in Scotland. It enjoyed a practical monopoly of the sale of raw and refined sugars, had right to distill spirits from molasses free of duty, dealt largely in cured herring and salmon, sent hides to English tanners and manufactured tobacco and linseed oil. It challenged the supremacy of Kilbirnie in the tobacco trade—fetching cargoes from Virginia, Maryland and Carolina in its own fleet—so that by 1773 its importations of tobacco amounted to more than half of the whole quantity brought into the United Kingdom. The tobacco merchants built handsome mansions and the town rapidly extended westwards. With the surplus profits new industries were created, which helped the city through the period of the American War. Most, though not all, of the manufactures in which Glasgow has always held a foremost place date from this period. It is recorded that James Watt succeeded in repairing the hitherto unworkable model of Newcomen's fire (steam) engine in his small workshop within the college precincts. Shipbuilding on a colossal scale and the enormous developments in the iron industries and engineering were practically the growth of the 19th century. The failure of the Western bank in 1857, the Civil War in the United States, the collapse of the City of Glasgow bank in 1878, among other disasters, involved heavy losses and distress, but recovery was always rapid.

GLASITES, or SANDEMANIANS,1 a Christian sect, founded in Scotland by John Glas (q.e.). It spread into England and America, but is now practically extinct. Glas dissented from the Westminster Confession only in his views as to the spiritual nature of the church and the functions of the civil magistrate. But his son-in-law Robert Sandeman added a distinctive doctrine as to the nature of faith which is thus stated on his tombstone: "That the bare death of Jesus Christ without a thought or deed on the part of man, is sufficient to present the chief of sinners spotless before God." In a series of letters to James Hervey, the author of Theron and Aspasia, he maintained that justifying faith is a simple assent to the divine testimony concerning Jesus Christ, differing in no way in its character from belief in any ordinary testimony. In their practice the Glasite churches aimed at a strict conformity with the primitive type of Christianity as understood by them. Each congregation had a plurality of elders, pastors or bishops, who were chosen according to what was declared to be the instructions of Paul, without regard to previous education or present occupation, and who enjoyed a perfect equality in office. To have been married a second time disqualified for ordination, or for continued tenure of the office of bishop. In all the action of the church unanimity was considered to be necessary; if any member differed in opinion from the rest, he must either surrender his judgment to that of the church, or be shut out from its communion. To join in prayer with any one not a member of the denomination was regarded as unlawful, and even to eat or drink with one who had been excommunicated was held to be wrong. The Lord's Supper was observed weekly; and between forenoon and afternoon service every Sunday a love feast was held at which every member was required to be present. Mutual exhortation was practised at all the meetings for divine service, when any member who had the gift of speech (χαρισμα) was allowed to speak. The practice of washing one another's feet was at one time observed; and it was for a long time customary for each brother and sister to receive new members, on admission, with a holy kiss. The Thorns, water and "blood" were rigorously abstained from; the latter was regarded as sacred; the accumulator of wealth they held to be unscriptural and improper, and each member considered his property as liable to be called upon at any time to meet the wants of the poor and the necessities of the church. Churches of this order were founded in Paisley, Glasgow, Edinburgh, Leith, Arbroath, Montrose, Aberdeen, Dunkeld, Cupal, Galashields, Liverpool and London, where Michael Faraday was long an elder. Their exclusiveness in practice, though not of education for the ministry, and the antinomian tendency of their doctrines contributed to their dissolution. Many Glasites joined the general body of Scottish Congregationalists, and the sect may now be considered extinct. The last of the Sandemanian churches in America ceased to exist in 1890.

See James Ross, History of Congregational Independence in Scotland (Glasgow, 1900). (D.M.N.)

GLASS (O.E. glæs, cf. Ger. Glae, perhaps derived from an Old Teutonic root gla-, a variant of gle-, having the general sense of shining, cf. "glare," "glow"), a hard substance, usually transparent or translucent, which from a fluid condition at a high temperature has passed to a solid condition with sufficient rapidity to prevent the formation of visible crystals. There are many varieties of glass differing widely in chemical composition and in physical qualities. Most varieties, however, have certain qualities in common. They pass through a viscous stage in cooling from a state of fluidity; they develop effects of colour when the glass mixtures are fused with certain metallic oxides; they are, when cold, bad conductors both of electricity and heat, they are easily fractured by a blow or shock and show a conchoidal fracture; they are but slightly affected by ordinary solvents, but are readily attacked by hydrofluoric acid.

The structure of glass has been the subject of repeated investigations. The theory most widely accepted at present is that glass is a quickly solidified solution, in which silicas; silicates, borates, phosphates and aluminates may be either solvents or solutes, and metallic oxides and metals may be held either in solution or in suspension. Long experience has fixed the mixtures, so far as ordinary furnace temperatures are concerned, which produce the varieties of glass in common use. The essential materials of which these mixtures are made are, for English flint glass, sand, carbonate of potash and red lead; for plate and sheet glass, sand, carbonate or sulphate of soda and carbonate of lime; and for Bohemian glass, sand, carbonate of potash and carbonate of lime. It is convenient to treat these glasses as "normal" glasses, but they are in reality mixtures of silicates, and cannot rightly be regarded as definite chemical compounds or represented by definite chemical formulae.

The knowledge of the chemistry of glass-making has been considerably widened by Dr. F. O. Schott's experiments at the Lentz works. The commercial success of these works has demonstrated the value of pure science to manufacture.

The recent large increase in the number of varieties of glass has been chiefly due to developments in the manufacture of optical glass. Glasses possessing special qualities have been required, and have been supplied by the introduction of new combinations of materials. The range of the specific gravity of glasses from 2:5 to 5:0 illustrates the effect of modified compositions. In the same way glass can be rendered more or less fusible, and its stability can be increased both in relation to extremes of temperature and to the chemical action of solvents.

The fluidity of glass at a high temperature renders possible the processes of ladelling, pouring, casting and stirring. A mass of glass in a viscous state can be rolled with an iron roller like dough; can be rendered hollow by the pressure of the human breath or by compressed air; can be forced by air pressure, or by a mechanically driven plunger, to take the shape and impress of a mould; and can be almost indefinitely extended as solid rod or as hollow tube. So extensible is viscous glass that it can be drawn out into a filament sufficiently fine and elastic to be woven into a fabric.

Glasses are generally transparent but may be translucent or opaque. Semi-opacity due to crystallization may be induced in many glasses by maintaining them for a long period at a temperature just insufficient to cause fusion. In this way is produced the cryalline, devitrified material, known as Réamur's porcelain. Semi-opacity and opacity are usually produced by the addition to the glass-mixtures of materials which will remain in suspension in the glass, such as oxides of arsenic, phosphate of lime, cryolite or a mixture of felspar and fluorspar.

Little is known about the actual cause of colour in glass beyond the fact that certain materials added to and melted with certain glass-mixtures will in favourable circumstances produce effects of colour. The colouring agents are generally metallic oxides. The same oxide may produce different colours with different glass-mixtures, and different oxides of the same metal may produce different colours. The purple-blue of cobalt, the chrome green or yellow of chromium, the dichroic canary-colour of uranium and the violet of manganese, are constant. Ferrous oxide produces an olive green or a pale blue according to the glass with which it is mixed. Ferric oxide gives a yellow colour, but requires the presence of an oxidizing agent to prevent
reduction to the ferrous state. Lead gives a pale yellow colour.

Silver oxide, mixed as a paint and spread on the surface of a piece of glass and heated, gives a permanent yellow stain. Finely divided vegetable charcoal added to a soda-lime glass gives a yellow colour. It has been suggested that the colour is due to sulphur, but the effect can be produced with a glass mixture containing no sulphur, free or combined, and by increasing the proportion of charcoal the intensity of the colour can be increased until it reaches black opacity. Selenites and selenates give a pale pink or pinkish yellow. Tellurium appears to give a pale pink tint. Nickel with a potash-lead glass gives a violet colour, and a brown colour with a soda-lime glass. Copper gives a peacock-blue which becomes green if the proportion of the copper oxide is increased. If oxide of copper is added to a glass mixture containing a strong reducing agent, a glass is produced which when first taken from the crucible is colourless but on being reheated develops a deep crimson - ruby colour. A similar glass, if its cooling is greatly retarded, produces throughout its substance minute crystals of metallic copper, and closely resembles the mineral called avanturine. There is also an intermediate stage in which the glass has a rusty red colour by reflected light, and a purple-blue colour by transmitted light. Glass containing gold behaves in almost precisely the same way, but the ruby glass is less crimson than copper ruby glass. J. E. C. Maxwell Garnett, who has studied the optical properties of these glasses, has suggested that the changes in colour correspond with changes effected in the structure of the metals as they pass gradually from solution in the glass to a state of crystallization.

Owing to impurities contained in the materials from which glasses are made, accidental coloration or discoloration is often produced. For this reason chemical agents are added to glass mixtures to remove or neutralize accidental colour. Ferrous oxide is the usual cause of discoloration. By converting ferrous to ferric oxide the green tint is changed to yellow, which is less noticeable. Oxidation may be effected by the addition to the glass mixture of a substance which gives up oxygen at a high temperature, such as manganese dioxide or arsenic trioxide. With the same object, red lead and saltpetre are used in the mixture for potash-lead glass. Manganese dioxide not only acts as a source of oxygen, but develops a pink tint in the glass, which is complementary to and neutralizes the green colour due to ferrous oxide.

Glass is a bad conductor of heat. When boiling water is poured into a glass vessel, the vessel frequently breaks, on account of the unequal expansion of the inner and outer layers. If in the process of glass manufacture a glass vessel is suddenly cooled, the constituent particles are unable to arrange themselves and the vessel remains in a state of extreme tension. The surface of the vessel may be hard, but the vessel is liable to fracture on receiving a trilling shock. M. de la Bastie's process of "toughening" glass consisted in dipping glass, raised to a temperature slightly below the melting-point, into molten tallow. The surface of the glass was hardened, but the inner layers remained in unstable equilibrium. Directly the crust was pierced the whole mass was shattered into minute fragments. In all branches of glass manufacture the process of "annealing," i.e. cooling the manufactured objects sufficiently slowly to allow the constituent particles to settle into a condition of equilibrium, is of vital importance. The desired result is obtained either by moving the manufactured goods gradually away from a constant source of heat, or by placing them in a heated kiln and allowing the heat gradually to die out.

The furnaces (fig. 15) employed for melting glass are usually heated with gas on the "Siemens," or some similar system of regenerative heating. In the United States natural gas is used wherever it is available. In some English works coal is still employed for direct heating with various forms of mechanical stokers. Crude petroleum and a thin tar, resulting from the process of enriching water-gas with petroleum, have been used both with compressed air and with steam with considerable success. Electrical furnaces have not as yet been employed for ordinary glass-making on a commercial scale, but the electrical plants which have been erected for melting and moulding quartz suggest the possibility of electric heating being employed for the manufacture of glass. Many forms of apparatus have been tried for ascertaining the temperature of glass furnaces. It is usually essential that some parts of the apparatus shall be made to acquire a temperature identical with the temperature to be measured. Owing to the physical changes produced in the material exposed prolonged observations of temperature are impossible. In the Fery radiation pyrometer this difficulty is obviated, as the instrument may be placed at a considerable distance from the furnace. The radiation passing out from an opening in the furnace falls upon a concave mirror in a telescope and is focused upon a thermoelectric couple. The hotter the furnace the greater is the rise of temperature of the couple. The electromotive force thus generated is measured by a galvanometer, the scale of which is divided and figured so that the temperature may be directly read. (See THERMOMETRY.)

In dealing with the manufacture of glass it is convenient to group the various branches in the following manner:

Manufactured Glass,
I. Optical Glass
II. Blown Glass
Special glasses for thermometers, and other special glasses.
III. Mechanically Pressed Glass
A. Plate and rolled plate glass. B. Pressed table glass.
I. OPTICAL GLASS.—As regards both mode of production and essential properties optical glass differs widely from all other varieties. These differences arise primarily from the fact that glass for optical uses is required in comparatively large and thick pieces, while for most other purposes glass is used in the form of comparatively thin sheets; when, therefore, as a consequence
of Dollond's invention of achromatic telescope objectives in 1757, a demand first arose for optical glass, the industry was unable to furnish suitable material. Flint glass particularly, which appeared quite satisfactory when viewed in small pieces, was found to be so far from homogeneous as to be useless for lens construction. The first step towards overcoming this defect in optical glass was taken by P. L. Guinand, towards the end of the 18th century, by introducing the process of stirring the molten glass by means of a cylinder of fireclay. Guinand was induced to migrate from his home in Switzerland to Bavaria, where he worked at the production of homogeneous flint glass, first with Joseph von Utzschneider and then with J. Fraunhofer; the latter ultimately attained considerable success and produced telescope disks up to 28 centimetres (11 in.) diameter. Fraunhofer further initiated the specification of refraction and dispersion in terms of certain lines of the spectrum, and even attempted an investigation of the effect of chemical composition on the relative dispersion produced by glasses in different parts of the spectrum. Guinand's process was further developed in France by Guinand's sons and subsequently by Bontemps and E. Feil. In 1848 Bontemps was obliged to leave France for political reasons and came to England, where he initiated the optical glass manufacture at Chance's glass works near Birmingham, and this firm ultimately attained a considerable reputation in the production of optical glass, especially of large disks for telescope objectives. Efforts at improving optical glass had, however, not been confined to the descendants and successors of Guinand and Fraunhofer. In 1824 the Royal Astronomical Society of London appointed a committee on the subject, the experimental work being carried out by Faraday. Faraday independently recognized the necessity for mechanical agitation of the molten glass in order to ensure homogeneity, and to facilitate his manipulations he worked with dense lead boric glasses which are very fusible, but have proved too unstable for ordinary optical purposes. Later Mâes of Clichy (France) exhibited some "zinc crown" glass in small plates of optical quality at the London Exhibition of 1851; and another French glass-maker, Lamé, produced a dense thallium glass in 1867. In 1834 W. V. Harcourt began experiments in glass-making, in which he was subsequently joined by G. G. Stokes. Their object was to pursue the inquiry begun by Fraunhofer as to the effect of chemical composition on the distribution of dispersion. The specific effect of boric acid in this respect was correctly ascertained by Stokes and Harcourt, but they mistook the effect of titanic acid. J. Hopkinson, working at Chance's glass works, subsequently made an attempt to produce a titanium silicate glass, but nothing further resulted.

The next and most important forward step in the progress of optical glass manufacture was initiated by Ernst Abbe and carried out jointly by him and O. Schott at Jena in Germany. Aided by grants from the Prussian government, these workers systematically investigated the effect of introducing a large number of different chemical substances (oxides) into vitreous fluxes. As a result a whole series of glasses of novel composition and optical properties were produced. A certain number of the most promising of these, from the purely optical point of view, had unfortunately to be abandoned for practical use owing to their chemical instability, and the problem of Fraunhofer, viz. the production of pairs of glasses of widely differing refraction and dispersion, but having a similar distribution of dispersion in the various regions of the spectrum, was not in the first instance solved. On the other hand, while in the older crown and flint glasses the relation between refraction and dispersion had been practically fixed, dispersion and refraction increasing regularly with the density of the glass, in some of the new glasses introduced by Abbe and Schott this relation is altered and a relatively low refractive index is accompanied by a relatively high dispersion, while in others a high refractive index is associated with low dispersive power.

The initiative of Abbe and Schott, which was greatly aided by the resources for scientific investigation available at the Physikalische Reichsanstalt (Imperial Physical Laboratory), led to such important developments that similar work was undertaken in France by the firm of Mantois, the successors of Feil, and somewhat later by Chance in England. The manufacture of the new varieties of glasses, originally known as "Jena" glasses, is now carried out extensively and with a considerable degree of commercial success in France, and also to a less extent in England, but none of the other makers of optical glass has as yet contributed to the progress of the industry to anything like the same extent as the Jena firm.

The older optical glasses, now generally known as the "ordinary" crown and flint glasses, are all of the nature of pure silicates, the basic constituents being, in the case of crown glasses, lime and soda or lime and potash, or a mixture of both, and in the case of flint glasses, lead and either (or both) soda and potash. With the exception of the heavier flint (lead) glasses, these can be produced so as to be free both from noticeable colour and from such defects as bubbles, opaque inclusions or "striae," but extreme care in the choice of all the raw materials and in all the manipulations is required to ensure this result. Further, these glasses, when made from properly proportioned materials, possess a very considerable degree of chemical stability, which is amply sufficient for most optical purposes. The newer glasses, on the other hand, contain a much wider variety of chemical constituents, the most important being the oxides of boric, magnesium, aluminium and zinc, used either with or without the addition of the bases already named in reference to the older glasses, and—among acid bodies—boric anhydride (B₂O₃) which replaces the silica of the older glasses to a varying extent. It must be admitted that, by the aid of certain of these new constituents, glasses can be produced which, as regards purity of colour, freedom from defects and chemical stability are equal or even superior to the best of the "ordinary" glasses, but it is a remarkable fact that when this is the case the optical properties of the new glasses do not fall very widely outside the limits set by the older glasses. On the other hand, the more extreme the optical properties of these new glasses, i.e. the further they depart from the ratio of refractive index to dispersive power found in the older glasses, the greater the difficulty found in obtaining them of either sufficient purity or stability to be of practical use. It is, in fact, admitted that some of the glasses, most useful optically, the dense barium crown glasses, which are so widely used in modern photographic lenses, cannot be produced entirely free either from noticeable colour or from small bubbles, the chemical nature of these glass is so sensitive that considerable care is required to protect the surfaces of lenses made from them if serious tarnishing is to be avoided. In practice, however, it is not found that the presence either of a decidedly greenish-yellow colour or of numerous small bubbles interferes at all seriously with the successful use of the lenses for the majority of purposes, so that it is preferable to sacrifice the perfection of the glass in order to secure valuable optical properties.

It is a further striking fact, not unconnected with those just enumerated, that the extreme range of optical properties covered by the relatively large number of optical glasses now available is in reality very small. The refractive indices of all glasses at present available lie between 1·46 and 1·90, whereas transparent minerals are known having refractive indices lying considerably outside these limits; at least one of these, fluoride (calcium fluoride), is actually used by opticians in the construction of certain lenses, so that probably progress is to be looked for in a considerable widening of the limits of available optical materials; possibly such progress may lie in the direction of the artificial production of large mineral crystals.

The qualities required in optical glasses have already been partly referred to, but may now be summarized:—

1. Transparency and Freedom from Colour.—These qualities can be readily judged by inspection of the glass in pieces of considerable thickness, and they may be quantitatively measured by means of the specks rendersmietrometer.

2. Homogeneity.—The optical desideratum is uniformity of refractive index and dispersive power throughout the mass of the glass. This is probably never completely attained, variations in the sixth
significant figure of the refractive index being observed in different parts of single large blocks of the most perfect glass. While such microscopical irregularities are harmless or bright lines according to the position of the eye. Plate glass of the usual quality, which appears to be perfectly homogeneous when looked at in the ordinary way, is seen to be a mass of fine striae, when a considerable thickness is examined in parallel light. Plate glass is, nevertheless, considerably used for the cheaper forms of lenses, where the scattering of the light and loss of definition arising from these fine striae is not readily recognizable.

3. Hardness and Chemical Stability.—These properties contribute to the durability of lenses, and are specially desirable in the outer members of lens combinations which are likely to be subjected to frequent handling or are exposed to the weather. As a general rule, to which, however, there are important exceptions, both these qualities are found to a greater degree, the lower the refractive index of the glass. The chemical stability of the power of resisting disintegrating effects of atmospheric moisture and carbonic acid, depends largely upon the quantity of alkalis contained in the glass and their proportion, but lead, lime or barium present, the stability being generally less the higher the proportion of alkali. A high silica-content tends towards both hardness and chemical stability, and this can be further increased by the addition of small proportions of boron acid; in large quantities, however, the latter constituent produces the opposite effect.

4. Absence of Internal Strain.—Internal strain in glass arises from the unequal contraction of the outer and inner portions of mass of glass during cooling. Processes of annealing, or very gradual cooling, are intended to relieve these strains, but such processes are only completely effective when the cooling, particularly through temperatures where the glass is just losing the back traces of plasticity, is extremely gradual, a rate measured in hours per degree Centigrade being required. The existence of internal strain in glass may readily be recognized by examination in polarized light, any signs of double refraction indicating the existence of strain. If the glass is very badly annealed, the lenses made from it may fly to pieces during or after manufacture, but apart from such extreme cases the optical effects of internal strain are not readily observed except in large optical apparatus. Very perfectly annealed optical glass is now, however, readily obtainable.

5. Refraction and Dispersion.—The purely optical properties of refraction and dispersion, although of the greatest importance, cannot be dealt with in any detail here; for an account of the optical properties required in glasses for various forms of lenses see the artiline, "Optical Systems." As an example of the range of modern optical glasses Table 1. is given, which constituted the list of optical glasses exhibited by Messrs Chance at the Optical Convention in London in 1905. In this table is the refractive index of the glass for sodium light (the D line of the solar spectrum), while the letters C, F, and G refer to lines in the hydrogen spectrum, by which dispersion is now generally specified. The symbol \( \beta \) represents the inverse of the dispersive power, its value being \( (n^2-1)/C-F \). The very much longer lists of German and French firms contain only a few types not represented in this table.

**Manufacture of Optical Glass.**—In its earlier stages, the process for the production of optical glass closely resembles that used in the production of window glass of the highest quality. The raw materials are selected with great care and assiduously specified, but whereas in most glasses the only impurities to be dreaded are those that are either insusible or produce a colouring effect upon the glass, for optical purposes the admixture of other glass-forming bodies than those which are intended to be present must be avoided on account of their effect in modifying the optical constants of the glass. Constancy of composition of the raw materials and their careful and thorough admixture in constant proportions are therefore essential to the production of the required glasses. The materials are generally used in the form either of oxides (lead, zinc, silica, &c.) or of salts readily decomposed by heat, such as the nitrates or carbonates. Fragments of glass of the same composition as that aimed at are generally incorporated to a limited extent with the mixed raw materials to facilitate their fusion. The crucibles or pots used for the production of optical glass very closely resemble those used in the manufacture of flint glass for other purposes; they are "covered" and the molten materials are thus protected from the action of the furnace gases by the interposition of a wall of fireclay, but as crucibles for optical glasses are used for only one fusion and are then broken up, they are not made so thick and heavy as those used in flint-glass making, since the latter remain in the furnace for many weeks. On the other hand, the chemical and physical nature of the fireclays used in the manufacture of such crucibles requires careful attention in order to secure the best results. The furnace used for the production of optical glass is generally constructed to take one crucible only, so that the heat of the furnace may be accurately adjusted to the requirements of the particular glass under treatment. These small furnaces are frequently arranged for direct coal firing, but regenerative gas-fired furnaces are also employed. The empty crucible, having first been gradually dried and heated to a bright red heat in a subsidiary furnace, is taken up by means of massive iron tongs and introduced into the previously heated furnace, the temperature of which is then gradually raised. When a suitable temperature for the fusion of the particular glass in question has been attained, the mixture of raw materials is introduced in comparatively small quantities at a time. In this way the crucible is gradually filled with a mass of molten glass, which is, however,
full of bubbles of all sizes. These bubbles arise partly from the air enclosed between the particles of raw materials and partly from the gaseous decomposition products of the materials themselves. In the next stage of the process, the glass is raised to a high temperature in order to render it sufficiently fluid to allow of the complete elimination of these bubbles; the actual temperature required varies with the composition of the glass, a bright red heat sufficing for the most fusible glasses, while with others the utmost capacity of the best furnaces is required to attain the necessary temperature. With these latter glasses there is, of course, considerable risk that the partial fusion and consequent contraction of the fireclay of the crucible may result in its destruction and the entire loss of the glass. The stages of the process so far described generally occupy from 36 to 60 hours, and during this time the constant care and watchfulness of those attending the furnace is required. This is still more the case in the next stage. The examination of small test-pieces of the glass withdrawn from the crucible by means of an iron rod having shown that the molten mass is free from bubbles, the stirring process may be begun, the object of this manipulation being to render the glass as homogeneous as possible and to secure the absence of veins or striae in the product. For this purpose a cylinder of fireclay, provided with a square axial hole at the upper end, is heated in a small subsidiary furnace and is then introduced into the molten glass. Into the square axial hole fits the square end of a hooked iron bar which projects several yards beyond the mouth of the furnace; by means of this bar a workman moves the fireclay cylinder about in the glass with a steady circular sweep. Although the weight of the iron bar is carried by a support, such as an overhead chain or a swivel roller, this operation is very laborious and trying, more especially during the earlier stages when the heat radiated from the open mouth of the crucible is intense. The men who manipulate the stirring bars are therefore changed at short intervals, while the bars themselves have also to be changed at somewhat longer intervals. As they are thus utilized, the weight of the iron bar is increased, and accumulated scale would tend to fall off them, thus contaminating the glass below. The stirring process is begun when the glass is perfectly fluid at a temperature little short of the highest attained in its fusion, but as the stirring proceeds the glass is allowed to cool gradually and thus becomes more and more viscous until finally the stirring cylinder can scarcely be moved. When the glass has acquired this degree of consistency it is supposed that no fresh movements can occur within its mass, so that if homogeneity has been attained the glass will preserve itself indefinitely. The stirring is therefore discontinued and the clay cylinder is either left embedded in the glass, or by the exercise of considerable force it may be gradually withdrawn. The crucible with the semi-solid glass which it contains is now allowed to cool considerably in the melting furnace, or it may be removed to another slightly heated furnace. When the glass has cooled so far as to become hard and solid, the furnace is hermetically sealed up and allowed to cool very gradually to the ordinary temperature. If the cooling is very gradual—occupying several weeks—it sometimes happens that the entire contents of a large crucible, weighing perhaps 1000 lb, are found intact as a single mass of glass, but more frequently the mass is found broken up into a number of fragments of various sizes. From the large masses great lenses and mirrors may be produced, while the smaller pieces are used for the production of the disks and slabs of moderate size, in which the optical glass of commerce is usually supplied. In order to allow of the removal of the glass from the crucible, a long iron rod is inserted into the crucible, which is lowered and the glass carefully separated from the fragments of fireclay. The pieces of glass are then examined for the detection of the grosser defects, and obviously defective pieces are rejected. As the fractured surfaces of the glass in this condition are unsuitable for delicate examination a good deal of glass that passes this inspection has yet ultimately to be rejected. The next stage in the preparation of the glass is the process of moulding and annealing. Lumps of glass of approximately the right weight are chosen, and are heated to a temperature just sufficient to soften the glass, when the lumps are caused to assume the shape of moulds made of iron or fireclay either by the natural flow of the softened glass under gravity, or by pressure from suitable tools or presses. The glass, now in its approximate form, is placed in a heated chamber where it is allowed to cool very gradually—the minimum time of cooling from a dull red heat being six days, while for fine annealing a much longer period is required (see above). At the end of the annealing process the glass issues in the shape of disks or slabs slightly larger than required by the optician in each case. The glass is, however, by no means ready for delivery, since it has yet to be examined with scrupulous care, and all defective pieces must be rejected entirely or at least the defective part must be cut out and the slab remoulded or ground down to a smaller size. For the purpose of rendering this minute examination possible, opposite plane surfaces of the glass are ground approximately flat and polished, the faces to be polished being so chosen as to allow of a view through the greatest possible thickness of glass; thus in slabs the narrow edges are polished.

It will be readily understood from the above account of the process of production that optical glass, relatively to other kinds of glass, is very expensive, the actual price varying from 3s. to 30s. per lb in small slabs or disks. The price, however, rapidly increases with the total bulk of perfect glass required in one piece, so that large disks of glass suitable for telescope objectives of wide aperture, or blocks for large prisms, become exceedingly costly. The reason for this high cost is to be found partly in the fact that the yield of optically perfect glass even in large and successful meltings rarely exceeds 50% of the total weight of glass melted. Further, all the subsequent processes of cutting, moulding and annealing become increasingly difficult, owing to the greatly increased risk of breakage arising from either external injury or internal strain, as the dimensions of the individual pieces of glass increase. Nevertheless, disks of optical glass, both crown and flint, have been produced up to 30 in. in diameter.

II. BLOWN GLASS. (A) Table-ware and Vases.—The varieties of glass used for the manufacture of table-ware and vases are the potash-lead glass, the soda-lime glass and the potash-lime glass. These glasses may be colourless or coloured. Venetian glass is a soda-lime glass; Bohemian is a potash-lime glass. The potash-lead glass, which was first used on a commercial scale in England for the manufacture of table-ware, and which is known as “flint” glass or “crystal” is also largely used in France, Germany and the United States. Table II. shows the typical composition of these glasses.

For melting the leadless glasses, open, bowl-shaped crucibles are used, ranging from 12 to 40 in. in diameter. Glass mixtures containing lead are melted in covered, beehive-shaped crucibles holding from 12 to 18 cwt. of glass. They have a hooped opening on one side near the top. This opening serves for the introduction of the glass-mixture, for the removal of the melted glass and as a source of heat for the processes of manipulation. The Venetian furnaces in the island of Murano are small low structures heated with wood. The heat passes from the melting furnace into the annealing kiln. In Germany, Austria and the United States, gas furnaces are generally used. In England directly-heated coal furnaces are still in common use, which in many cases are stoked by mechanical feeders. There are two systems of annealing. The manufactured goods are either removed gradually from a constant source of heat by means of a train of small iron trucks drawn along a tramway by an
endless chain, or are placed in a heated kiln in which the fire is allowed gradually to die out. The second system is especially used for annealing large and heavy objects. The manufacture of table-ware is carried on by small gangs of men and boys. In England each "gang" or "chair" consists of three men and one boy. In works, however, in which most of the goods are moulded, and where less skilled labour is required, the proportion of boy labour is increased. There are generally two shifts of workmen, each shift working six hours, and the work is carried on continuously from Monday morning until Friday morning. Directly work is suspended the glass remaining in the crucibles is ladled into water, drained and dried. It is then mixed with the glass mixture and broken glass ("cullet"), and replaced in the crucibles. The furnaces are driven to a white heat in order to fuse the mixture and expel bubbles of gas and air. Before work begins the temperature is lowered sufficiently to render the glass viscous. In the viscous state a mass of glass can be coiled upon the heated end of an iron rod, and if the rod is hollow can be blown into a hollow bulb. The tools used are extremely primitive — hollow iron blowing-ropes, solid rods for holding vessels during manipulation, spring tools, resembling sugar-tongs in shape, with steel or wooden blades for fashioning the viscous glass, callipers, measure-sticks, and a variety of moulds of wood, carbon, cast iron, gun-metal and plaster of Paris (figs. 16 and 17). The most important tool, however, is the bench or "chair" on which the workman sits, which serves as his lathe. He sits between two rigid parallel arms, projecting forwards and backwards and sloping slightly from back to front. Across the arms he balances the iron rod to which the glass bulb adheres, and rolling it backwards and forwards with the fingers of his left hand fashions the glass between the blades of his sugar-tongs tool, grasped in his right hand. The hollow bulb is worked into the shape it is intended to assume, partly by blowing, partly by gravitation, and partly by the workman's tool. If the blowing iron is held vertically with the bulb uppermost the bulb becomes flattened and shallow, if the bulb is allowed to hang downwards it becomes elongated and reduced in diameter, and if the end of the bulb is pierced and the iron is held horizontally and sharply trundled, as a mop is trundled, the bulb opens out into a flattened disk.

During the process of manipulation, whether on the chair or whilst the glass is being reheated, the rod must be constantly and gently trundled to prevent the collapse of the bulb or vessel. Every natural development of the spherical form can be obtained by blowing and fashioning by hand. A non-spherical form can only be produced by blowing the hollow bulb into a mould of the required shape. Moulds are used both for giving shape to vessels and also for impressing patterns on their surface. Although spherical forms can be obtained without the use of moulds, moulds are now largely used for even the simplest kinds of tableware in order to economize time and skilled labour. In France, Germany and the United States it is rare to find a piece of tableware which has not received its shape in a mould. The old and the new systems of making a wine-glass illustrate almost all the ordinary processes of glass working. Sufficient glass is first "gathered" on the end of a blowing iron to form the bowl of the wine-glass. The mere act of coiling an exact weight of molten glass round the end of a rod 4 ft. in length requires considerable skill. The mass of glass is rolled on a polished slab of iron, the "marver," to solidify it, and it is then slightly hollowed by blowing. Under the old system the form of the bowl is gradually developed by blowing and by shaping the bulb with the sugar-tongs tool. The leg is either pulled out from the substance of the base of the bowl, or from a small lump of glass added to the base. The foot starts as a small independent bulb on a separate blowing iron. One extremity of this bulb is made to adhere to the end of the leg, and the other extremity is broken away from its blowing iron. The fractured end is heated, and by the combined action of heat and centrifugal force opens out into a flat foot. The bowl is now severed from its blowing iron and the unfinished wine-glass is supported by its foot, which is attached to the end of a working rod by a metal clip or by a seal of glass. The fractured edge of the bowl is heated, trimmed with scissors and melted so as to be perfectly smooth and even, and the bowl itself receives its final form from the sugar-tongs tool.

Under the new system the bowl is fashioned by blowing the slightly hollowed mass of glass into a mould. The leg is formed and a small lump of molten glass is attached to its extremity to form the foot. The blowing iron is constantly trundled, and the small lump of glass is squeezed and flattened into the shape of a foot, either between two slabs of wood hinged together, or by pressure against an upright board. The bowl is severed from the blowing iron, and the wine-glass is sent to the annealing oven with a bowl, longer than that of the finished glass, and with a rough fractured edge. When the glass is cold the surplus is removed either by grinding, or by applying heat to a line scratched with a diamond round the bowl. The fractured edge is smoothed by the impact of a gas flame.

In the manufacture of a wine-glass the ductility of glass is illustrated on a small scale by the process of pulling out the leg. It is more strikingly illustrated in the manufacture of glass cane and tube. Cane is produced from a solid mass of molten glass, tube from a mass hollowed by blowing. One workman holds the blowing iron with the mass of glass attached to it, and another fixes an iron rod by means of a seal of glass to the extremity of the mass. The two workmen face each other and walk backwards. The diameter of the cane or tube is regulated by the weight of glass carried, and by the distance between the workmen. It is a curious property of viscous glass that whatever form is given to the mass of glass before it is drawn out is retained by the finished cane or tube, however small its section may be. Owing to this property, tubes or canes can be produced with a square, oblong, oval or triangular section. Exceedingly fine canes of milk-white glass play an important part in the masterpieces produced by the Venetian glass-makers of the 16th century. Vases and drinking cups were produced of extreme lightness, in the walls of which were repeated the patterns of work in fineness and intricacy. The canes from which the patterns are formed are either simple or complex. The latter are made by dipping a small mass of molten colourless glass into an iron cup around the inner wall of which short lengths of white cane have been arranged at
regular intervals. The canes adhere to the molten glass, and the mass is first twisted and then drawn out into fine cane, which contains white threads arranged in endless spirals. The process can be almost indefinitely repeated and canes formed of extreme complexity. A vase decorated with these simple or complex canes is produced by embedding short lengths of the cane on the surface of a mass of molten glass and blowing and fashioning the mass into the required shape.

Table-ware and vases may be wholly coloured or merely decorated with colour. Touches of colour may be added to vessels in course of manufacture by means of seals of molten glass, applied like sealing-wax; or by causing vessels to wrap themselves round with threads or coils of coloured glass. By the application of a pointed iron hook, while the glass is still ductile, the parallel coils can be distorted into bands, loops or zigzags. The surface of vessels may be spangled with gold or platinum by rolling the hot glass on metallic leaf, or irisdecent, by the deposition of metallic tin, or by the corrosion caused by the chemical action of acid fumes. Gilding and enamel decoration are applied to vessels when cold, and fixed by heat.

Cutting and engraving are mechanical processes for producing decorative effects by abrading the surface of the glass when cold. The abrasion is effected by pressing the glass against the edge of wheels, or disks, of hard material revolving on horizontal spindles. The spindles of cutting wheels are driven by steam or electric power. The wheels for making deep cuts are made of iron, and are fed with sand and water. The wheels range in diameter from 18 in. to 3 in. Wheels of carborundum are also used. Wheels of fine sandstone fed with water are used for making slighter cuts and for smoothing the rough surface left by the iron wheels. Polishing is effected by wooden wheels fed with wet pumice-powder and rottenstone and by brushes fed with moistened putty-powder. Patterns are produced by combining straight and curved cuts. Cutting brings out the brilliancy of glass, which is one of its intrinsic qualities. At the end of the 18th century English cut glass was unrivalled for design and beauty. Gradually, however, the process was applied without restraint and the products lost all artistic quality. At the present time cut glass is steadily regaining favour.

Engraving is a process of drawing on glass by means of small-copper wheels. The wheels range from ¾ in. to 2 in. in diameter, and are fed with a mixture of fine emery and oil. The spindles to which the wheels are attached revolve in a lathe worked by a foot treadle. The true use of engraving is to add interest to vessels by means of coats of arms, crests, monograms, inscriptions and graceful outlines. The improper use of engraving is to hide defective material. There are two other processes of marking patterns on glass, but they possess no artistic value. In the "sandblast" process the surface of the glass is exposed to a stream of sharp sand driven by compressed air. The parts of the surface which are not to be blasted are covered by adhesive paper. In the "etching" process the surface of the glass is etched by the chemical action of hydrofluoric acid, the parts which are not to be attacked being covered with a resinous paint. The glass is first dipped in this protective liquid, and when the paint has dried, the pattern is scratched through it with a sharp point. The glass is then exposed to the acid.

Glass stoppers are fitted to bottles by grinding. The mouth of the bottle is ground by a revolving iron cone, or mandrel, fed with sand and water and driven by steam. The head of the stopper is fastened in a chuck and the peg is ground to the size of the mouth of the bottle by means of sand and water pressed against the glass by bent strips of thin sheet iron. The mouth of the bottle is then pressed by hand on the peg of the stopper, and the mouth and peg are ground together with a medium of very fine emery and water until an air-tight joint is secured.

The revival in recent years of the craft of glass-blowing in England must be attributed to William Morris and T. G. Jackson, R.A. (Pl. II. figs. 11 and 12). They, at any rate, seem to have been the first to grasp the idea that a wine-glass is not merely a bowl, a stem and a foot, but that, whilst retaining simplicity of form, it may nevertheless possess decorative effect. They, moreover, suggested the introduction for the manufacture of table-glass of a material similar in texture to that used by the Venetians, both colourless and tinted.

The colours previously available for English table-glass were ruby, canary-yellow, emerald-green, dark peacock-green, light peacock-blue, dark purple-blue and a dark purple. About 1870 the "Jackson" table-glass was made in a light, dull green glass. The dull green was followed successively by amber, whiteopal, blueopal, straw-opal, sea-green, horn colour and various pale tints of soda-lime glass, ranging from yellow to blue. Experiments were also tried with a violet-coloured glass, a violet opal, a transparent black and with glasses shading from red to blue, red to amber and blue to green.

In the Paris Exhibition of 1900 surface decoration was the prominent feature of all the exhibits of table-glass. The carved or "cameo" glass, introduced by Thomas Webb of Stourbridge in 1878, had been copied with varying success by glass-makers of all nations. In many specimens there were three or more layers of differently coloured glass, and curious effects of blended colour were obtained by cutting through, or partly through, the different layers. The surface of the glass had usually been treated with hydrofluoric acid so as to have a satin-like gloss. Some vases of this character, shown by Émile Gallé and Daum Frères of Nancy, possessed considerable beauty. The "Favrile" glass of Louis C. Tiffany of New York (Pl. II. fig. 13) owes its effect entirely to surface colour and lustre. The happiest specimens of this glass almost rival the wings of butterflies in the brilliancy of their iridescent colours. The vases of Karl Koenig of Berlin are so fantastic and so fragile that they appear to be creations of the lamp rather than of the furnace. An illustration is also given of some of Powell's "Whitefriars" glass, shown at the St Louis Exhibition, 1904 (Pl. II. fig. 14). The specimens of "pâte de verre" exhibited by A. L. Dammouse, of Sèvres, in the Musée des Arts décoratifs in Paris, and at the London Franco-British Exhibition in 1908, deserve attention. They have a semi-opaque body with an "egg-shell" surface and are delicately tinted with colour. The shapes are exceedingly simple, but some of the pieces possess great beauty. The material and technique suggest a close relationship to porcelain.

(B) Tube.—The process of making tube has already been described. Although the bore of the thermometer-tube is exceedingly small, it is made in the same way as ordinary tube. The white line of enamel, which is seen in some thermometers behind the bore, is introduced before the mass of glass is pulled out. A flattened cake of viscous glass-enamel is welded on to one side of the mass of glass after it has been hollowed by blowing. The bore of the tube, after the enamel has been applied, is made and finished in the crucible and covered with a layer of transparent glass; the whole mass is then pulled out into tube. If the section of the finished tube is to be a triangle, with the enamel and bore at the base, the molten mass is pressed into V-shaped mould before it is pulled out.

In modern thermometry instruments of extreme accuracy are required, and researches have been made, especially in Germany and France, to ascertain the causes of variability in mercury and alcohol thermometers, and how such variability is to be removed or reduced. In all mercurial thermometers there is a slight depression of the ice-point after exposure to high temperatures; it is also not uncommon to find that the readings of two thermometers between the ice- and boiling-points fail to agree at any intermediate temperature, although the ice- and boiling-points of both have been determined together with perfect accuracy, and the intervening spaces have been equally divided. It has been proved that these variations depend upon the great extent of the crystals existing in the glass of which the thermometer is made. Special glasses have therefore been produced by Tonnelot in France and at the Jena glass-works in Germany expressly for the manufacture of thermometers for accurate physical measurements; the analyses of these are shown in Table III.
Since the discovery of the Röntgen rays, experiments have been made to ascertain the effects of the different constituents of glass on the transparency of glass to X-rays. The oxides of lead, barium, zinc and antimony are found perceptibly to retard the rays. The glass tubes, therefore, from which the X-ray bulbs are to be fashioned, must not contain any of these oxides, whereas the glass used for making the funnel-shaped shields, which direct the rays upon the patient and at the same time protect the hands of the operator from the action of the rays, must contain a large proportion of lead.

Among the many developments of the Jena Works, not the least important are the glasses made in the form of a tube, from which gas-chimneys, gauge-glasses and chemical apparatus are fashioned, specially adapted to resist sudden changes of temperature. One method is to form the tube of two layers of glass, one being considerably more expansive than the other.

(C) Sheet and Crown-glass.—Sheet-glass is almost wholly a soda-lime-silicate glass, containing only small quantities of iron, alumina and other impurities. The raw materials used in this manufacture are chosen with considerable care, since the requirements as to the colour of the product are somewhat stringent. The materials ordinarily employed are the following: sand, of good quality, uniform in grain and free from any notable quantity of iron oxide; carbonate of lime, generally in the form of a pure variety of powdered limestone; and sulphate of soda. A certain proportion of soda ash (carbonate of soda) is also used in some works in sheet-glass mixtures, while "decolorizing" (substances intended to remove or reduce the colour of the glass) are also sometimes added, those most generally used being manganese dioxide and arsenic. Another essential ingredient of all glass mixtures containing sulphate of soda is some form of carbon, which is added either as coke, charcoal or anthracite coal; the carbon so introduced aids the reducing substances contained in the atmosphere of the furnace in bringing about the reduction of the sulphate of soda to a condition in which it combines more readily with the silicic acid of the sand. The proportions in which these ingredients are mixed vary according to the exact quality of glass required and with the form and temper of the sheet-glass.
GLASS

is next carried to a rack and the pipe detached from it by applying a cold iron to the neck of thick hot glass which connectspipe-butt and cylinder, the neck cracking at the touch. Next, the rest of the connecting neck is detached from the cylinder by the application of a heated iron to the chilled glass. This leaves a cylinder with roughly parallel ends; these ends are cut by the use of a diamond-stone and inserted into the main opening of the furnace, so that the neck is ordinarily of the same length. The split cylinder is passed to the flattening furnace, where it is exposed to a red heat, sufficient to soften the glass; when soft the cylinder is laid upon a smooth flat slab and flattened down upon it by the careful application of pressure with some form of rubbing implement, which frequently takes the form of a block of charred wood. When flattened, the sheet is moved away from the working opening of the furnace, and pushed to a system of movables, by means of which it is slowly moved along a tunnel, away from a source of heat nearly equal in temperature to that of the flattening chamber. The glass thus cools gradually as it passes down the tunnel and is thereby adequately annealed.

The process of sheet-glass manufacture described above is typical of that in use in a large number of works, but many modifications are to be found, particularly in the furnaces in which the glass is melted. In some works, the older method of melting the glass in large pots or crucibles is still adhered to, although the old-fashioned coal-fired furnaces have nearly everywhere given place to the use of producer gas and reversing furnaces. For the production of coloured sheet-glass, however, the employment of pot furnaces is still almost universal, probably because the quantities of glass required of any one tinto are insufficient to employ even a small tank furnace continuously; the exact control of the colour is also more readily attained with the smaller bulk of glass which has to be dealt with in pots. The general nature of the colouring ingredients employed, and the colour effects produced by them, have already been mentioned. In coloured sheet-glass, two distinct kinds are to be recognized; in one kind, the colouring matter is contained in the body of the glass itself, while in the other the colour sheet consists of ordinary white glass covered upon one side with a thin coating of intensely coloured glass. The latter kind is known as "coloured," and is universally employed in the case of colouring matters whose effect is so intense that in any usual thickness of glass they would cause almost entire opacity. Coloured glass is produced by taking either the first or the last gathering in the production of a cylinder out of a crucible containing the coloured "metal," the other gathering being taken out and the crucible replenished with a mixture of white and yellow glass. It is important that the thermal expansion of the two materials which are thus incorporated should be nearly alike, as otherwise warping of the finished sheet is liable to result.

Mechanical Processes for the Production of Sheet-glass.—The complicated and indirect process of sheet-glass manufacture has led to numerous inventions aiming at a direct method of production by more or less mechanical means. All the earlier attempts in this direction failed on account of the difficulty of bringing the glass to the machines without introducing air-bubbles, which are always formed in molten glass when it is ladled or poured from one vessel into another. More modern inventors have therefore adopted the plan of drawing the glass direct from the furnace. In an American process the glass is drawn direct from the molten mass in the tank in a cylindrical form by means of an iron ring previously immersed in the glass, and is kept in shape by means of special devices for cooling it rapidly as it leaves the molten bath. In this process, however, the entire operations of splitting and flattening are retained, and although the mechanical process is said to be in successful commercial operation, it has not as yet made itself felt as a formidable rival to hand-made sheet-glass. An effort at a more direct mechanical process is embodied in the inventions of Foucault which are at present being developed in Germany and Belgium; in this process the glass is drawn from the molten bath in the shape of flat sheets, by the aid of a bar of iron, previously immersed in the glass, the glass receiving its form by being drawn through slots in large fire-bricks, and being kept in shape by rapid chilling produced by the action of air-blasts. The mechanical operation is quite successful for thick sheets, but it is not as yet available for the thinner sheets required for the ordinary purpose of sheet-glass, since with these excessive breakage occurs, while the sheets generally show grooves or lines derived from small regularities of the drawing office. For the production of thick sheets which are subjected to be drawn in a circular process may thus claim considerable success, but it is not as yet possible to produce satisfactory sheet-glass by such means.

Crown-glass has at the present day almost disappeared from the market, and it has been superseded by sheet-glass, the more modern processes described above being capable of producing much larger sheets of glass, free from the knoth or "bullion" which may still be seen in old crown-glass windows. For a few isolated purposes, however, it is desirable to use a glass which has not been touched upon either surface and thus preserves the lustre of its "fire polish" undiminished; this can be attained in crown-glass but not in sheet, since one side of the latter is always more or less marked by the rubber used in the process of flattening. One of the few uses of crown-glass of this kind is the glass slides upon which microscopic specimens are mounted, as well as the thin glass slips with which such prepara-tions are covered. A full account of the process of blowing crown-glass will be found in all older books and articles on the subject, so that it need only be mentioned here that the glass, instead of being blown into a cylinder, is blown into a flattened sphere, which is caused to burst at the point opposite the pipe and is then, by the rapid spinning of the glass in front of a very hot furnace-opening, caused to expand into a flat disk of large diameter. This only requires to be annealed and is then ready for cutting up, but the lump of glass by which the original globe was attached to the pipe remains as the bullion in the centre of the disk of glass.

Coloured Glass for Masonic Windows.—The production of coloured glass, or "masonic," windows has become a separate branch of glass-making. Charles Winston, after prolonged study of the coloured windows of the 13th, 14th and 15th centuries, convinced himself that no approach to the colour effect of these windows could be made with glass which is thin and even in section, homogeneous in texture, and made and coloured with highly refined materials. To obtain the effect it was necessary to reproduce as far as possible the conditions under which the early craftsmen worked, and to create scientifically glass which could be made in colour, irregular in section, and non-homogeneous in texture. The glass is made in cylinders and in "crown" or circles. The cylinders measure about 14 in. in length by 8 in. in diameter, and vary in thickness from 1 to 3 in. The crowns are about 15 in. in diameter, and vary in thickness from 2 to 4 in., the centre being the thickest. These cylinders and crowns may be either solid colour or flashed. Great variety of colour may be obtained by flashing one colour upon another, such as blue on green, and ruby on blue, green or yellow.

E. J. Prior has introduced an ingenious method of making small oblong and square sheets of coloured glass, which are thick in the centre and taper towards the edges, and which have one surface slightly roughened and one brilliantly polished. Glass is blown into an oblong box-shaped iron mould, about 12 in. in depth and 6 in. across. A hollow rectangular bottle is formed, the base and sides of which are converted into sheets. The outer surface of these sheets is slightly roughened by contact with the iron mould.

(4) Bottles and mechanically blown Glass.—The manufacture of bottles has become an industry of vast proportions. The demand constantly increases, and, owing to constant improvements in material in the moulds and in the methods of working, the supply fully keeps pace with the demand. Except for making bottles of special colours, gas-heated tank furnaces are in general use. Melting and working are carried on continually. The essential qualities of a bottle are strength and power to resist chemical corrosion. The materials are selected with a view to secure these qualities. For the highest quality of bottles, which
are practically colourless, sand, limestone and sulphate and carbonate of soda are used. The following is a typical analysis of high quality bottle-glass: SiO₂, 60-15%; CaO, 13-00%; CaO, 15-00%; Al₂O₃, 2-05%; and Fe₂O₃, 0-65%. For the commoner grades of dark-coloured bottles the glass mixture is cheapened by substituting common salt for part of the sulphate of soda, and by the addition of felspar, granite, graniteite, furnace slag and other substances fusible at a high temperature. Bottle moulds are made of cast iron, either in two pieces, hinged together at the base or at one side, or in three pieces, one forming the body and two pieces forming the neck.

A bottle gang or "shop" consists of five persons. The "gatherer" gathers the glass from the tank furnace on the end of the blowing-iron, rolls it on a slab of iron or stone, slightly expands the glass by blowing, and hands the blowing iron and glass to the "blower." The blower places the glass in the mould, closes the mould by pressing a lever with his foot, and either blows down the blowing iron or attaches it to a tube connected with a supply of compressed air. When the air has forced the glass to take the form of the mould, the mould is opened and the blower gives the blowing iron with the bottle attached to it to the "wetter off." The wetter off touches the top of the neck of the bottle with a moistened piece of iron and by tapping the blowing iron detaches the bottle and drops it into a wooden trough. He then grips the body of the bottle with a four-pronged clip, attached to an iron rod, and passes it to the "bottle maker." The bottle maker heats the fractured neck of the bottle, binds a band of molten glass round the end of it and simultaneously shapes the inside and the outside of the neck by using the tool shown in fig. 18. The finished bottle is taken by the "taker in" to the annealing furnace. The bottles are stacked in iron trucks, which, when full, are moved slowly away from a constant source of heat.

The processes of manipulation which have been described, although in practice they are very rapidly performed, are destined to be replaced by the automatic working of a machine. Bottle-making machines, based on Ashley's original patent, are already being largely used. They ensure absolute regularity in form and save both time and labour. A bottle-making machine combines the process of pressing with a plunger with that of blowing by compressed air. The neck of the bottle is first formed by the plunger, and the body is subsequently blown by compressed air admitted through the plunger. A sufficient weight of molten glass to form a bottle is gathered and placed in a funnel-shaped vessel which serves as a measure, and gives access to the mould which shapes the outside of the neck. A plunger is forced upwards into the glass in the neck-mould and forms the neck. The funnel is removed, and the plunger, neck-mould and the mass of molten glass attached to the neck are inverted. A bottle mould rises and envelops the mass of molten glass. Compressed air admitted through the plunger forces the molten glass to take the form of the bottle mould and completes the bottle.

In the case of the machine patented by Michael Owens of Toledo, U.S.A., for making tumblers, lamp-chimneys, and other goods of similar character, the manual operations required are (1) gathering the molten glass at the end of a blowing iron; (2) placing the blowing iron with the glass attached to it in the machine; (3) removing the blowing iron with the blown vessel attached to the machine (fig. 19) consists of a revolving table carrying five or six moulds. The moulds are opened and closed by cranks actuated by compressed air. As soon as a blowing iron is in connexion with an air jet, the sections of the mould close upon the molten glass, and the compressed air forces the glass to take the form of the mould. After removal from the machine, the tumbler is severed from the blowing iron, and its fractured edge is trimmed.

Compressed air or steam is also used for fashioning very large vessels, baths, dishes and reservoirs by the "Sievert" process. Molten glass is spread upon a large iron plate of the required shape and dimensions. The flattened mass of glass is held by a rim, connected to the edge of the plate. The plate with the glass attached to it is inverted, and compressed air or steam is introduced through openings in the plate. The mass of glass, yielding to its own weight and the pressure of air or steam, sinks downwards and adapts itself to any mould or receptacle beneath it.

The processes employed in the manufacture of the glass bulbs for incandescent electric lamps, are similar to the old-fashioned processes of bottle making. The mould is in two pieces hinged together; it is heated and the inner surface is rubbed over with finely powdered plumago. When the glass is being blown in the mould the blowing iron is twisted round and round so that the finished bulb may not be marked by the joint of the mould.

III. MECHANICALLY PRESSED GLASS. (A) Plate-glass.—The glass popularly known as "plate-glass" is made by casting and rolling. The following are typical analyses:

The raw materials for the production of plate-glass are chosen with great care so as to secure a product as free from colour as possible, since the relatively great thickness of the sheets...
would render even a faint tint conspicuous. The substances employed are the same as those used for the manufacture of sheet-glass, viz., pure sand, a pure form of carbonate of lime, and sulphate of soda, with the addition of a suitable proportion of carbon in the form of coke, charcoal or anthracite coal.

The glass to be used for the production of plate is universally melted in pots or crucibles and not in open tank furnaces. When the glass is completely melted and "fine," i.e. free from bubbles, it is allowed to cool down to a certain extent so as to become viscous or pasty. The whole pot, with its contents of viscous glass, is then removed bodily from the furnace by means of huge tongs and is transported to a crane, which grips the pot, raises it, and ultimately tips it over so as to pour the glass upon the slab of the rolling-table. In most modern works the greater part of these operations, as well as the actual rolling of the glass, is carried out by mechanical means, steam power and subsequently electrical power having been successfully applied to this purpose; the handling of the great weights of glass required for the largest sheets of plate-glass which are produced at the present time would, indeed, be impossible without the aid of machinery. The casting-table usually consists of a perfectly smooth cast-iron slab, frequently built up of a number of pieces carefully fitted together, mounted upon a truck and built up of a table to which it can be readily moved to any desired position in the casting-room. The viscous mass having been thrown on the casting-table, a large and heavy roller passes over it and spreads it out into a sheet. Rollers up to 5 tons in weight are employed and are now generally driven by power. The width of the sheet or plate is regulated by moving guides which are placed in front of the roller and are pushed along by it, while its thickness is regulated by raising or lowering the roller relatively to the surface of the table. Since the surfaces produced by rolling have subsequently to be ground and polished, it is essential that the glass should leave the rolling-table with as smooth a surface as possible, so that great care is required in this part of the process. It is, however, equally important that the glass as a whole should be flat and remains flat during the process of gradual cooling (annealing), otherwise great thicknesses of glass would have to be ground away at the projecting parts of the sheet. The annealing process is therefore carried out in a manner differing essentially from that in use for any other variety of flat glass and nearly resembling that used for optical glass. The rolled sheet is left on the casting-table until it has set sufficiently to be pushed over a flat iron plate without risk of distortion; meanwhile the table has been placed in front of the opening of one of the large annealing kilns and the slab of glass is carefully pushed into the kiln. The annealing kilns are large fire-brick chambers of small height but with sufficient floor area to accommodate four or six large slabs, and the slabs are placed directly upon the floor of the kiln, which is built up of carefully dressed blocks of burnt fire-clay resting upon a bed of sand; in order to avoid any risk of working or buckling in this floor these blocks are set slightly apart and thus have room to expand freely when heated. Before the glass is introduced, the annealing kiln is heated to dull red by means of coal fires in grates which are provided at the ends or sides of the kiln for that purpose. When the floor of the kiln has been covered with slabs of glass the opening is carefully built up and luted with fire-bricks and fire-clay, and the whole is then allowed to cool. In the walls and floor of the kiln special cooling channels or air passages are provided and by gradually opening these to atmospheric circulation the cooling is considerably accelerated while a very even distribution of temperature is obtained; by these means even the largest slabs can now be cooled in three or four days and are neverthless sufficiently well annealed to be free from any serious internal stress. From the annealing kiln the slabs of glass are transported to the cutting room, where they are cut square, defective slabs being rejected or cut down to smaller sizes. The glass at this stage has a comparatively dull surface and this must now be replaced by that brilliant and perfectly polished surface which is the chief beauty of this variety of glass. The first step in this process is that of grinding the surface down until all projections are removed and a close approximation to a perfect plane is obtained. This operation, like all the subsequent steps in the polishing of sheet-glass, is carried out by electrical machinery. By means of a rotating table either two surfaces of glass, or one surface of glass and one of cast iron, are rubbed together with the interposition of a powerful abrasive such as sand, emery or carbon-undum. The machinery by which this is done has undergone numerous modifications and improvements, all tending to produce more perfectly plane glass, to reduce the risk of breakage, and to lessen the expenditure of time and power required per sq. yd. of glass to be worked. It is impossible to describe this machinery within the limits of this article, but it is notable that the principal difficulties to be overcome arise from the necessity of providing the glass with a perfectly continuous and unyielding support to which it can be firmly attached but from which it can be detached without undue difficulty. When the surface of the glass has been ground down to a plane, the surface itself is still "grey," i.e. deeply pitted with the marks of the abrasive used in grinding it down; these marks are removed by the process of smoothing, in which the surface is successively ground with abrasives of gradually increasing fineness, leaving ultimately a smooth and very minutely pitted "grey" surface. This smooth surface is then brilliantly polished by the aid of friction with a rubbing tool covered with a soft substance like leather or felt and fed with a polishing material, such as rouge. A few strokes of such a rubber are sufficient to produce a decidedly "polished" appearance, but prolonged rubbing under considerable pressure and the use of a polishing paste of a proper consistency are required in order to remove the last trace of pitting from the surface. This entire process must, obviously, be applied in turn to each of the two surfaces of the slab of glass. Plate-glass is manufactured in this manner in thicknesses varying from \( \frac{1}{8} \) in. to 1 in. or even more, while single sheets are produced measuring more than 27 ft. by 13 ft. "Rolled Plate" and figured "Rolled Plate."—Glass for this purpose, with perhaps the exception of the best white and tinted varieties, is now universally produced in tank-furnaces, similar in a general way to those used for sheet-glass, except that the furnaces used for "rolled plate" glass of the roughest kinds do not need such minutely careful attention and do not work at so high a temperature. The composition of these glasses is very similar to that of sheet-glass, but for the ordinary kinds of rolled plate much less scrupulous selection need be made in the choice of raw materials, especially of the sand.

The glass is taken from the furnace in large iron ladles, which are carried upon slings running on overhead rails; from the ladle the glass is thrown upon the cast-iron bed of a rolling-table, and is rolled into sheet by an iron roller, the process being similar to that employed in making plate-glass, but on a smaller scale. The sheet thus rolled is roughly trimmed while hot and soft, so as to remove those portions of glass which have been spilt by immediate contact with the ladle, and the sheet, still soft, is pushed into the open mouth of an annealing tunnel or "leat," down which it is carried by a system of moving grids. The surface of the glass produced in this way may be modified by altering the surface of the rolling-table; if the table has a smooth surface, the glass will also be more or less smooth, but much dented and buckled on the surface and far from having the smooth face of blown sheet. If the table has a pattern engraved upon it, the glass will show the same pattern in relief, the most frequent pattern of the kind being either small parallel ridges or larger ribs crossing to form a lozenge pattern.

The more elaborate patterns found on what is known as "figure rolled plate" are produced in a somewhat different manner; the glass used for this purpose is considerably whiter in colour and much softer than ordinary rolled plate, and instead of being rolled out on a table it is produced by rolling between two moving rollers from which the sheet issues. The roller is impressed upon the soft sheet by a printing roller which is brought down upon the glass as it leaves the main rolls. This

small furnaces are usually heated by an oil spray under the pressure of steam or compressed air.

History of Glass Manufacture.

The great similarity in form, technique and decoration of the earliest known specimens of glass-ware suggests that the castle of glass-making originated from a single centre. It has been generally assumed that Egypt was the birthplace of the glass industry. It is true that many conditions existed in Egypt favourable to the development of the craft. The Nile supplied a waterway for the conveyance of fuel and for the distribution of the finished wares. Materials were available providing the essential ingredients of glass. The Egyptian potteries afforded experience in dealing with vitreous glasses and vitreous colours, and from Egyptian alabaster-ware veins vessels were wrought, which may well have suggested the decorative arrangement of zigzag lines (see Plate 1. figs. 1, 2, 4 d) so frequently found on early specimens of glass-ware. In Egypt, however, no traces have at present been found of the industry in a rudimentary stage. It has always been classed as "primitive" bear witness to an elaboration of technique far in advance of the experimental period. The earliest specimens of glass-ware which can be definitely claimed as Egyptian productions, and the glass manufactory discovered by Dr Flinders Petrie at Tell el Amarna, belong to the period of the XVIIIth dynasty. The comparative lateness of this period makes it difficult to account for the wall painting at Beni Hasan, which accurately represents the process of glass-blowing, and which is attributed to the period of the XIXth dynasty. Dr Petrie surmounts the difficulty by saying that the process depicted is not glass-blowing, but some metallurgical process in which reeds were used tipped with lumps of clay. It is possible that the picture does not represent Egyptian glass-blowers, but is a traveller's record of the process of glass-blowing seen in some foreign or subject country. The scarcity of specimens of early glass-ware actually found in Egypt, and the advanced technique of those which have been found, lead to the supposition that glass-making was exotic and not a native industry. The tradition, recorded by Pliny (Nat. Hist. xxxvi. 65), assigns the making of glass to Syria, and the geographical position of that country, its forests as a source of fuel, and its deposits of sand add probability to the tradition. The story that Phoenician merchants found a glass-like substance under their cooking pots, which had been supported or blocks of natron, need not be discarded as pure fiction. The fire may well have caused the natron, an impure form of carbonate of soda, to combine with the surrounding sand to form silicate of soda, which, although not a permanent glass, is sufficiently glass-like to suggest the

the day-labourer can now have on his table at a nominal price glass dishes of elaborate design, which only an expert can distinguish from hand-cut crystal. The deceptive effect is in some cases heightened by cutting over and polishing by hand the pressed surface.

The glass for pressed ware must be colourless, and, when molten, must be sufficiently fluid to adapt itself readily to the intricacies of the moulds, which are often exceedingly complex. The materials employed are sand, sulphate of soda, nitrate of soda, calcspar and in some works carbonate of barium. The following is an analysis of a specimen of English pressed glass: SiO₂, 70-68%; Na₂O, 18-38%; CaO, 5-45%; BaO, 4-17%; Al₂O₃, 0-33%; and Fe₂O₃, 0-20%. Tanks and pots are both used for melting the glass. The moulds are made of cast iron. They are usually in two main pieces, a base and an upper part or collar of hinged sections. The plunger is generally worked by a hand lever. The operator knows by touch when the plunger has pressed the glass far enough to exactly fill the mould. Although the moulds are heated, the surface of the glass is always slightly ruffled by contact with the mould. For this reason every piece of pressed glass-ware, as soon as it is liberated from the mould, is exposed to a sharp heat in a small subsidiary furnace in order that the ruffled surface may be removed by melting. These

These
possibility of creating a permanent transparent material. Moreover, Pliny (xxvi. 66) actually records the discovery which effected this result by the Vitruvius. Pliny describes the discovery as follows: "Coeptus addit magnes lapis." There have been many conjectures as to the meaning of the words "magnes lapis." The material has been considered by some to be magnetic iron ore and by others oxide of manganese. Oxides of iron and manganese can only be used in glass manufacture in comparatively small quantities for the purpose of colouring or neutralizing colour in glass, and their introduction would not be a matter of sufficient importance to be specially recorded. In chapter 25 of the same book Pliny describes five varieties of "magnes lapis." One of these he says is found in magnesia, is white in colour, does not attract iron and is like pumice stone. This variety must certainly be magnesium limestone. Magnesium limestone mixed and fused with sand and an alkaline carbonate produces a permanent glass. The scene of the discovery of glass is placed by Pliny on the banks of the little river Belus, under the heights of Mount Carmel, where sand suitable for glass-making exists and wood for fuel is abundant. In this neighbourhood fragments and lumps of glass are still constantly being dug up, and analysis proves that the glass contains a considerable proportion of magnesia. The district was a glass-making centre in Roman times, and it is probable that the Romans inherited and perfected an indigenous industry of remote antiquity. Pliny has so accurately recorded the stages by which a permanent glass was developed that it may be assumed that he had good reason for claiming for Syria the discovery of glass. Between Egypt and Syria there was frequent intercourse both of conquest and commerce. It was customary for the victor after a successful raid to carry off skilled artisans as captives. It is recorded that Tahutmes III. sent Syrian artisans to Egypt. Glass-blowers may have been amongst their captive craftsmen, and may have started the industry in Egypt. The claims of Syria and Egypt are at the present time so equally balanced that it is advisable to regard the question of the birthplace of the glass industry as one that has still to be settled.

The "primitive" vessels which have been found in Egypt are small in size and consist of columnar stibium jars, flattened bottles and amphora, all decorated with zigzag lines, tiny wide-mouthed vases on feet and minute jugs. The vessels of later date which have been found in considerable quantities, principally in the coast towns and islands of the Mediterranean, are amphora and alabastra, also decorated with zigzag lines. The amphora (Plate I. figs. 1 and 2) terminate with a point, or with an unfinished extension from the terminal point, or with a knob. The alabastra have short necks, are slightly wider at the shoulder and have rounded bases. Dr Petrie has called attention to two technical peculiarities to be found in almost every specimen of early glass-ware. The inner surface is roughened (Plate I. fig. 4 c), and has particles of sand adhering to it, as if the vessel had been filled with sand and subjected to heat, and the inside of the neck has the impression of a metal rod (Plate I. fig. 4 a), which appears to have been extracted from the neck with difficulty. From this evidence Dr Petrie has assumed that the vessels were not blown, but formed upon a core of sandy paste, modelled upon a copper rod, the rod being the core of the neck (see Egypt: Art and Archaeology). The evidence, however, hardly warrants the abandonment of the simple process of blowing in favour of a process which is so difficult that it may almost be said to be impossible, and of which there is no record or tradition except in connexion with the manufacture of small beads. The technical difficulties to which Dr Petrie has called attention seem to admit of a somewhat less heroic explanation. A modern glass-blower, when making an amphora-shaped vase, finishes the base first, forms it expanded to the finished base with a seal, divides the vase from the blowing iron, and finishes the mouth, whilst he holds the vase by the iron attached to its base. The "primitive" glass-worker reversed this process. Having blown the body of the vase, he finished the mouth and neck part, and fixed a small, probably hollow, copper rod inside the finished neck by pressing the neck upon the rod (Plate I. fig. 4 b). Having heated the body of the vase from the blowing iron, he heated and closed the fractured base, whilst holding the vase by means of the rod fixed in the neck. Nearly every specimen shows traces of the pressure of a tool on the outside of the neck, as well as signs of the base having been closed by melting. Occasionally a knob or excrescence, formed by the residue of the glass beyond the point at which the base has been pinched together, remains as a silent witness of the process.

If glass-blowing had been a perfectly new invention of Graeco-Egyptian or Roman times, some specimens illustrating the transition from core-moulding to blowing must have been discovered. The absence of traces of the transition strengthens the supposition that the revolution in technique merely consisted in the discovery that it was more convenient to finish the base of a vessel before its mouth, and such a revolution would leave no trace behind. The roughened inner surface and the adhering particles of sand may also be accounted for. The vessels, especially those in which many differently coloured glasses were incorporated, required prolonged annealing. It is probable that when the metal rod was withdrawn the vessel was filled with sand, to prevent collapse, and buried in heated ashes to anneal. The greater the heat of the ashes the more would the sand adhere to and impress the inner surface of the vessels. The decoration of zigzag lines was probably applied directly after the body of the vase had been blown. Threads of coloured molten glass were spirally coiled round the body, and, whilst still viscid, were dragged into zigzags with a metal hook.

Egypt.—The glass industry flourished in Egypt in Graeco-Egyptian and Roman times. All kinds of vessels were blown, both with and without moulds, and both moulding and cutting were used as methods of decoration. The great variety of these vessels is well shown in the illustrated catalogue of Graeco-Egyptian glass in the Cairo museum, edited by C. C. Edgar. Another species of glass manufacture in which the Egyptians would appear to have been peculiarly skilled is the so-called mosaic glass, formed by the union of rods of various colours in such a manner as to form a pattern; the rod so formed was then reheated and drawn out until reduced to a very small size, 1 sq. in. or less, and divided into tablets by being cut transversely, each of these tablets presenting the pattern traversing its substance and visible on each face. This process was no doubt first practised in Egypt, and is never seen in such perfection as in objects of a decidedly Egyptian character. Very beautiful pieces of ornament of an architectural character are met with, which probably once served as decorations of caskets or other small pieces of furniture or of trinkets; also tragic masks, horns, flowers, and birds. Some of these are mere wafers with such truth of colouring and delicacy of detail that even the separate feathers of the wings and tail are well distinguished, although, as in an example in the British Museum, a human-headed hawk, the piece which contains the figure may not exceed ½ in. in its largest dimension. Works of this description probably belong to the period when Egypt passed under Roman domination, as similar objects, though of inferior delicacy, appear to have been made in Rome.

Assyria.—Early Assyrian glass is represented in the British Museum by a vase of transparent greenish glass found in the north-west palace of Nineveh. On one side of this a lion is engraved, and also a line of cuneiform characters, in which is the name of Sargon, king of Assyria, 722 B.C. Fragments of coloured glasses were also found there, but our materials are too scanty to enable us to form any decided opinion as to the degree of perfection to which the art was carried in Assyria. Many of the specimens discovered by Layard at Nineveh have all the appearance of being Roman, and were no doubt derived from the Roman colony, Ninivah Claudiiopolis, which occupied the same site.

Roman Glass.—In the first centuries of our era the art of glass-making was developed at Rome and other cities under Roman rule in a most remarkable manner, and it reached a point of

Fig. 13.—TIFFANY GLASS.

Fig. 14.—WHITEFRIARS GLASS, 1906.
excellence which in some respects has never been excelled or even perhaps equalled. It may appear a somewhat exaggerated assertion that glass was used for more purposes, and in one sense more extensively, by the Romans of the imperial period than by ourselves in the present day; but it is one which can be borne out by evidence. It is true that the use of glass for windows was only gradually extending itself at the time when Roman civilization sank under the torrent of German and Hunnish barbarism, and that its employment for optical instruments was only known in a rudimentary stage; but for domestic purposes, for architectural decoration and for personal orna-
ments glass was unquestionably much more used than at the present day. It must be remembered that the Romans possessed no fine procelain decorated with lively colours and a beautiful glaze; Samian ware was the most decorative kind of pottery which was then made. Coloured and ornamental glass held among them much the same place for table services, vessels for toilet use and the like, as that held among us by porcelain. Pliny (Nat. Hist. xxxvi. 26, 67) tells us that for drinking vessels it was even preferred to gold and silver.

Glass was largely used in pavements, and in thin plates as a coating for walls. It was used in windows, though by no means exclusively, mica, alabaster and shells having been also em-
ployed. Glass, in flat pieces, such as might be employed for windows, has been found in the ruins of Roman houses, both in England and in Italy, and in the house of the faun at Pompeii a small pane in a bronze frame remains. Most of the pieces have evidently been made by casting, but the discovery of fragments of sheet-glass at Silchester proves that the process of making sheet-glass was known to the Romans. When the window openings were large, as was the case in basilicas and other public buildings, and even in houses, the pieces of glass were, doubtless, fixed in pierced slabs of marble or in frames of wood or bronze. The Roman glass-blowers were masters of all the ordinary methods of manipulation and decoration. The flat pieces of glass were made by placing the jugs with wide, deeply ribbed, scientifically fixed handles, and by vessels and vases as elegant in form and light in weight as any that have been since produced at Murano. Their moulds, both for blowing hollow vessels and for pressing ornaments, were as perfect for the purposes for which they were intended as those of the present time. Their decorative cutting (Plate I. figs. 5 and 6), which took the form of simple, incised lines, or bands of shallow oval or hexagonal hollows, was more suited to the material than the deep prismatic cutting of comparatively recent times.

The Romans had at their command, of transparent colours, blue, green, purple or amethystine, amber, brown and rose; of opaque colours, white, black, red, blue, yellow, green and orange. There are many shades of transparent blue and of opaque blue, yellow and green. In any large collection of fragments it would be easy to find eight or ten varieties of opaque blue, ranging from lapis lazuli to turquoise or to lavender and six or seven of opaque green. Of red the varieties are fewer; the finest is a crimson red of very beautiful tint, and there are various gradations from this to a dull brick red. One variety forms the ground of a very good imitation of porphyry; and there is a dull semi-transparent red which, when light is passed through it, appears to be of a dull green hue. With these colours the Roman vitrarius worked, either using them singly or blending them in almost every conceivable combination, sometimes, it must be owned, with a rather gaudy and inharmon-
ious effect.

The materials to which the Venetians gave the name "mille fiore" were formed by arranging side by side sections of glass cane, the canes themselves being built up of differently coloured rods of glass, and binding them together by heat. A vast quantity of small cups and paterae were made by this means in patterns which bear considerable resemblance to the surfaces of madrepores. In these every colour and every shade of colour seem to have been tried in great variety of combination with effects more or less pleasing, but transparent violet or purple appears to have been the most common ground colour. Although most of the vessels of this mille fiori glass were small, some were made as large as 20 in. in diameter. Imitations of natural stones were made by stirring together in a crucible glasses of different colours, or by incorporating fragments of differently coloured glasses into a mass of molten glass by rolling. One variety in which transparent brown glass is mixed with opaque white and blue, and sometimes decorated to represent natural stone, has been constructed both with blue glass and with yellow glass. This latter appears to have been constructed in imitation of the natural stone. Sometimes purple glass is used in place of brown, probably with the design of imitating the precious murrhine. Imitations of porphyry, of serpentine, and of granite are also met with, but these were used chiefly in pavements, and for the decoration of walls, for which pur-
poses the onyx-glass was likewise employed.

The famous cameo glass was formed by covering a mass of molten glass with one or more coatings of a differently coloured glass. The usual process was to gather, first, a small quantity of opaque white glass; to coat this with a thick layer of trans-
lucent blue glass; and, finally, to cover the blue glass with a coating of the white glass. The outer coat was then removed from that portion which was to constitute the ground, leaving the white for the figures, foliage or other ornamentation; these were then sculptured by means of the gem-engraver's tools. Pliny no doubt means to refer to this when he says (Nat. Hist. xxxvi. 26, 66), "aluid argentil modo caelatur," contrasting it with the process of cutting glass by the help of a wheel, to which he refers in the words immediately preceding, "aluid torno teritur."

The Portland or Barberini vase in the British Museum is the finest example of this kind of work which has come down to us, and was entire until it was broken into some hundred pieces by a madman. The pieces, however, were joined together by Mr Doubleday with extraordinary skill, and the beauty of design and execution may still be appreciated. The two most celebrated examples of this cameo glass are the amphorae of the Pompeii and the Aulidzo vases. The amphora on the Aulidzo vase, 7 ft. 3 in. in height, 1 ft. 73 in. in circumference; it is shaped like the earthen amphorae with a foot far too small to support it, and must no doubt have had a stand, probably of gold; the greater part is covered with a most exquisite design of garlands and vines, and two groups of boys gathering and treading grapes and playing on various instruments of music; below these is a line of sheep and goats in varied attitudes. The ground is blue and the figures white. It was found in a house in the Street of Tombs at Pompeii in the year 1839, and is now in the Royal Museum at Naples. It is well engraved in Richardson's Studies of Ornamental Design. The Aulidzo vase, in the British Museum, is an oenochoe about 9 in. high; the ornament consists mainly of a most beautiful band of foliage, chiefly of the vine, with bunches of grapes; the ground is blue and the ornaments white; it was found at Pompeii in the house of the faun. It also has been engraved by Richardson. The same process was used in producing large tablets, employed, no doubt, for various decorative purposes. In the South Kensington Museum is a fragment of such a tablet or slab; the figure, a portion of which remains, could not have been less than about 14 in. high. The ground of these cameo glasses is most commonly transparent blue, but sometimes opaque blue, purple or dark brown. The superimposed layer, which is sculptured, is generally opaque white. A very few specimens have been met with in which several colours are employed.

At a long interval after these beautiful objects come those vessels which were ornamented either by means of coarse threads wound on their surfaces and forming rude patterns, or by coloured enamels merely placed on them in heaps, and these, doubtless, were cheap and common wares. But a modification of the first-named process was in use in the 4th and succeeding centuries, showing great ingenuity and manual dexterity,—that, namely, in which the added portions of glass are united to the body of the cup, not throughout, but only at points, and then shaped either by the wheel or by the hand (Plate I. fig. 3).
attached portions form in some instances inscriptions, as on a cup found at Strasbourg, which bears the name of the emperor Maximian (A.D. 286–310), on another in the Vereinigte Sammlungen at Munich, and on a third in the Triviali collection at Milan, where the cup is white, the inscription green and the network blue. Probably, however, the finest example is a stirula, 10½ in. high by 8 in. wide at the top and 4 in. at the bottom, preserved in the treasury of St Mark at Venice. This is of glass of a greenish hue; on the upper part is represented, in relief, the chase of a lion by two men on horseback accompanied by dogs; the costume appears to be Byzantine rather than Roman, and the style is very bad. The figures are very much undercut. The lower part has four rows of circles united to the vessel at those points alone where the circles touch each other. All the other examples have the lower portion covered in like manner by a network of circles standing nearly a quarter of an inch from the body of the cup. An example connected with the specimens just described is the cup belonging to Baron Lionel de Rothschild; though externally of an opaque greenish colour, it is by transmitted light of a deep red. On the outside, in very high relief, are figures of Bacchus with vines and panthers, some portions being hollow from within, others fixed on the exterior. The changeability of colour may remind us of the "calices versicolores" which Hadrian sent to Servianus. So few examples of glass vessels of this period which have been painted in enamel have come down to us that it has been questioned whether that art was then practised; but several specimens have been described which can leave no doubt on the point; decisive examples are afforded by two cups found at Vaspelev, in Denmark, engravings of which are published in the Annaler for Nordisk Oldkyndehed for 1861, p. 305. These are small cups, 3 in. and 2¾ in. high, 3½ in. and 3 in. wide, with feet and straight sides; on the larger is a lion and a bull, on the smaller two birds with grapes, and on each some smaller ornaments. On the latter are the letters DVB. R. The colours are vitrified and slightly in relief; green, blue and brown may be distinguished. They are found with Roman bronze vessels and other articles. The art of glass-making no doubt, like all other art, deteriorated during the decline of the Roman empire, but it is probable that it continued to be practised, though with constantly decreasing skill, not only in Rome but in the provinces. Roman technique was to be found in Byzantium and Alexandria, in Syria, in Spain, in France and Britain.

Early Christian and Byzantine Glass.—The process of embedding gold and silver leaf between two layers of glass originated as early as the 1st century, probably in Alexandria. The process consisted in spreading the leaf on a thin film of blown glass and pressing molten glass on to the leaf so that the molten glass cohered with the film of glass through the pores of the metallic leaf. If before this application of the molten glass the metallic leaf, whilst resting on the thin film of blown glass, was etched with a sharp point, patterns, emblems, inscriptions and pictures could be embedded and rendered permanent by the double coating of glass. The plaques thus formed could be reheated and fashioned into the bases of bowls and drinking vessels. In this way the so-called "fondi d’oro" of the catacombs in Rome were made. They are the broken bases of drinking vessels containing inscriptions, emblems, domestic scenes and portraits etched in gold leaf. Very few have any reference to Christianity, but they served as indestructible marks for indicating the position of interments in the catacombs. The fondi d’oro suggested the manufacture of plaques of gold which could be broken up into tesserae for use in mosaics.

Some of the Roman artificers in glass no doubt migrated to Constantinople, and it is certain that the art was practised there to a very great extent during the middle ages. One of the gates near the port took its name from the adjacent glass houses. St Sofia when erected by Justinian had vaults covered with mosaics and immense windows filled with plates of glass fitted into pierced marble frames; some of the plates, 7 to 8 in. wide and 9 to 10 in. high, not blown but cast, which are in the windows may possibly date from the building of the church. It is also recorded that pierced silver disks were suspended by chains and supported glass lamps "wrought by fire." Glass for mosaics was also largely made and exported. In the 8th century, when the Saracens made inroads between the caliph Walid and the emperor Justinian II, the former ordered a quantity of mosaic for the decoration of the new mosque at Damascus, and in the 10th century the materials for the decoration of the niche of the kibla at Cordova were furnished by Romanus II. In the 11th century Desiderius, abbot of Monte Casino, sent to Constantinople for workers in mosaic.

We have in the work of the monk Theophilus, Diversarum artium schediaca, and in the probably earlier work of Eracleus, about the 11th century, instructions as to the art of glass-making in general, and also as to the production of coloured and enamelled vessels, which these writers speak of as being practised by the Greeks. The only entire enameled vessel which we can confidently attribute to Byzantine art is a small vase preserved in the treasury of St Mark’s at Venice. This is decorated with circles of rosettes of blue, green and red enamel, each surrounded by lines of gold; within the circles are little figures evidently suggested by antique originals, and precisely like similar figures found on carved ivory boxes of Byzantine origin dating from the 13th or 12th century. Two inscriptions in Cufic characters surround the vase, but they, if they should be genuine, are merely ornamental and destitute of meaning. The presence of these inscriptions may perhaps lead to the inference that the vase was made in Sicily, but by Byzantine workmen. The double-handled blue-glass vase in the British Museum, dating from the 5th century, is probably a chalice, as it closely resembles the chalices represented on early Christian monuments.

Of uncoloured glass brought from Constantinople several examples exist in the treasury of St Mark’s at Venice, part of the plunder of the imperial city when taken by the crusaders in 1204. The glass in all is greenish, very thick, with many bubbles, and has been cut with the wheel; in some instances circles and cones, and in one the outlines of the figure of a leopard, have been left standing up, the rest of the surface having been laboriously cut away. The intention would seem to have been to imitate vessels of rock crystal. The so-called "Hedwig" glasses may also have originated in Constantinople. These are small cups deeply and rudely cut with conventional representa- tions of eagles, lions, and rosettes. One specimen is of a cup in the Rijks Museum at Amsterdam has an eagle and two lions. The specimen in the Germanic Museum at Nuremberg has two lions and a griffin.

Saracenic Glass.—The Saracenic invasion of Syria and Egypt did not destroy the industry of glass-making. The craft survived and flourished under the Saracenic régime in Alexandria, Cairo, Tripoli, Tyre, Aleppo and Damascus. In inventories of the 14th century both in England and in France mention may frequently be found of glass vessels of the manufacture of Damascus. A writer in the early part of the 15th century states that "glass-making is an important industry at Haleb (Aleppo)." Edward Dillon (Glass, 1902) has very properly laid stress on the importance of the enamelled Saracenic glass of the 13th, 14th and 15th centuries, pointing out that, whereas the Romans and Byzantine Greeks made some crude and ineffectual experiments in enamelling, it was under Saracenic influence that the processes of enamelling and gilding on glass vessels were perfected. An analysis of the glass of a Cairene mosque lamp shows that it is a soda-lime glass and contains as much as 45% of magnesia. This large proportion of magnesia undoubtedly supplied the stability required to withstand the process of enamelling. The enamelled Saracenic glasses take the form of flasks, vases, goblets, beakers and mosque lamps. The enamelled decoration on the lamps is restricted to lettering, scrolls and conventional foliage; on other objects figure-subjects of all descriptions are freely used. C. H. Read has pointed out a curious feature in the construction of the enamelled beakers. The base is double but the inner lining has an opening in the centre. Dillon has suggested that this central recess may have served to support a wick. It is possible, however,
that it served no useful purpose, but that the construction is a survival from the manufacture of vessels with fondi d'oro. The bases containing the embedded gold leaf must have been welded to the vessels to which they belonged, in the same way as the bases are welded to the Saracenic beakers. The enamelling process was probably introduced in the early part of the 13th century; most of the enamelled mosque lamps belong to the 14th century.

**Venetian Glass.**—Whether refugees from Padua, Aquileia or other Italian cities carried the art to the lagoons of Venice in the 5th century, or whether it was learnt from the Greeks of Constantinople at a much later date, has been a disputed question. It would appear not improbable that the former was the case, for it must be remembered that articles formed of glass were in the later days of Roman civilization in constant daily use, and that the making of glass was carried on, not as now in large establishments, but by artisans working on a small scale. It seems certain that some knowledge of the art was preserved in France, in Germany and in Spain, and it seems improbable that it should have been lost in that archipelago, where the traditions of ancient civilization must have been better preserved than in almost any other place. In 523 Cassiodorus writes of the "innumerosa navigia" belonging to Venice, and where trade is active there is always a probability that manufactures will flourish. However this may be, the earliest positive evidence of the existence at Venice of a worker in glass would seem to be the mention of Petrus Flavianus, physiocris, in the diaries of Vitale Falier in the year 1000. In 1224 twenty-nine persons are mentioned as friolari (i.e. phiolari), and in the same century "mariegole," or codes of trade regulations, were drawn up (Monografia della vetraria Veneziana e Muranese, p. 210). The manufacture had then no doubt attained considerable proportions: in 1268 the glass-workers became an incorporated body; in their processions they exhibited decanters, scent-bottles and the like; in 1279 they made, among other things, weights and measures. In the latter part of this century the glass-houses were almost entirely transferred to Murano. Thenceforward the manufacture continued to grow in importance; glass vessels were made in large quantities, as well as glass for windows. The earliest example which has as yet been described—a cup of blue glass, enamelled and gilt—is, however, not earlier than about 1440. A good many other examples have been preserved which may be assigned to the same century: the earlier of these bear a resemblance in form to the vessels of silver made in the west of Europe; in the latter an imitation of classical forms becomes apparent. Enamelled and gilt glass was not the only use of the enamelled glass: enormous vessels made of the same material as the preceding 219). The Venetian art, however, even in the 14th century, was not exclusively confined to the manufacture of glass, but there was a great deal of other work in glass, as we shall see later. In 1584, therefore, we find that the Venetian glass-makers were nearly entirely employed in the making of glass ornaments such as the murrine, or the "fondi di vetro," which were later to become so famous.

**The Making of Beads.**—The making of beads was probably practised at Venice from a very early period, but the earliest documentary evidence bearing on the subject does not appear to be of earlier date than the 14th century, when prohibitions were directed against those who made of glass such objects as were usually made of crystal or other hard stones. In the 16th century it had become a trade of great importance, and about 1564 twenty-two factories were employed in the production of beads. Towards the end of the same century from 600 to 900 workshops were, it is stated, employed on one branch of the art, that of ornamenting beads by the help of the blow-pipe. A very great variety of patterns was produced; a tariff of the year 1580 contains an enumeration of 562 species and a vast number of sub-species.

**The Efforts of the Venetians.**—The efforts made in France, Germany and England, in the 17th and 18th centuries, to improve the manufacture of glass in those countries had a very injurious effect on the industry of Murano. The invention of colourless Bohemian glass brought in its train the practice of cutting glass, a method of ornamentation for which Venetian glass, from its thinness, was ill adapted. One remarkable man, Giuseppe Briati, exerted himself, with much success, both in working in the old Venetian method and also in imitating the new fashions invented in Bohemia. He was especially successful in making vases and circular dishes of vitro di trina; one of the latter in the Correr collection at Venice, believed to have been made in his glass-house, measures 55 centimetres (nearly 22 in.) in diameter. The vases made by him are as elegant in form as the best of the Cinquecento period, but may perhaps be distinguished by the superior purity and brilliancy of the glass. He also made with great taste and skill large lustres and mirrors with frames of glass ornamented either in intaglio or with foliage of various colours. He obtained a knowledge of the methods of working practised in Bohemia by disguising himself as a porter, and thus worked for three years in a Bohemian glass-house. In 1736 he obtained a patent at Venice to manufacture glass in the Bohemian manner. He died in 1772.

**The Fall of the Venetian Glass.**—The fall of the republic was accompanied by interruption of trade and decay of manufacture, and in the last years of the Republic (the beginning of the 18th century) the industries of Murano were at a very low ebb. In the year 1838 Signor Bassusini revived several of the ancient processes of glass-working, and this revival was carried on by C. Pietro Biguglia in 1845, and by others, and later by Salvati, to whose successful efforts the modern renaissance of Venetian art glass is principally due.

**The Modern Art of Glass.**—The fame of Venice in glass-making so completely eclipsed that of other Italian cities that it is difficult to learn respecting their progress in the art. Hartshorne and Dillon have drawn attention to the important part played by the little Ligurian town, Altare, as a centre from which glass-workers migrated to all parts of Europe. It is said that the glass industry was established at Altare, in the 11th century, by French craftsmen. In the 14th century Muranese glass-workers settled there and developed the industry. It appears that as early as 1395 furnaces had been established at Treviso, Vicenza,
Glass

Padua, Mantua, Ferrara, Ravenna and Bologna. In 1534 there were two glass-houses in Rome and one in Florence; but whether any of these produced ornamented vessels, or only articles of common use and window glass, would not appear to have been as yet ascertained.

Germany—Glass-making in Germany during the Roman period seems to have been carried on extensively in the neighbour-hood of Cologne. The Cologne museum contains many specimens of Roman glass, some of which are remarkable for their cut decoration. The craft survived the downfall of the Roman power, and a native industry was developed. This industry must have won some reputation, for in 758 the abbott of Jarrow appealed to the bishop of Mainz to send him a worker in glass. There are few records of glass manufacture in Germany before the beginning of the 16th century. The positions of the factories were determined by the supply of wood for fuel, and subsequently, when the craft of glass-cutting was introduced, by the accessibility of water-power. The vessels produced by the 16th-century glass-workers in Germany, Holland and the Low Countries are closely allied in form and decoration. The glass is coloured (generally green) and the decoration consists of glass threads and glass studs, engraved with various motifs of their own invention. It was illustrated by the development of the “Roemer,” so popular as a drinking-glass, and as a feature in Dutch studies of still life. The “Igel,” a squat tumbler covered with prunts, gave rise to the “Knausrunk,” which is like the “Igel,” but longer and narrow-waisted. The “Roemer” itself consists of a cup, a short waist studded with prunts and a foot. The foot at first was formed by coiling a thread of glass round the base of the waist; but, subsequently, an open glass cone was joined to the base of the waist; and a glass thread was laid upon the surface to form the “Passglas,” another popular drinking-glass, is cylindrical in form and marked with horizontal rings of glass, placed at regular intervals, to indicate the quantity of liquor to be taken at a draught.

In the edition of 1581 of the De re metallica by Georg Agricola, there is a woodcut showing the interior of a German glass factory, and glass vessels both finished and unfinished.

In 1408 a Muranese glass-worker set up a furnace in Vienna, and another furnace was built in the same town by an Italian in 1486. In 1531 the town council of Nuremberg granted a subsidy to attract teachers of Venetian technique. Many specimens exist of German winged and enamelled glasses of Venetian character. The Venetian influence, however, was indirect rather than direct. The native glass-workers adopted the process of enamelling, but applied it to a form of decoration characteristically German. On tall, roomy, cylindrical glasses they painted portraits of the emperor and electors of Germany, or the imperial eagle bearing on its wings the arms of the states composing the empire. The earliest-known example of these enamelled glasses bears the date 1533. They were immensely popular and the fashion for them lasted into the 18th century. Some of the later specimens have views of cities, battle scenes and processions painted in grisaille.

A more important outcome, however, of Italian influence was the production in emulation of Venetian glass, of a glass made of refined potash, lime and sand, which was more colourless than the material it was intended to imitate. This colourless potash-lime glass has always been known as Bohemian glass. It was well adapted for receiving cut and engraved decoration, and in these processes the German craftsmen proved themselves to be exceptionally skilful. At the end of the 16th century Rudolph II. brought Italian rock-crystal cutters from Milan to take control of the crystal and glass-cutting works he had established at Prague. It was at Prague that Caspar Lehmann and Zachary Belzer learnt the craft of cutting glass. George Schwanhart, a pupil of Caspar Lehmann, started glass-cutting at Ratisbon, and about 1600 Stephen Schmidt and Hermann Schnekel introduced the crafts of cutting and engraving glass in Nuremberg. To the German masters must be ascribed, by discovery, or development, of colourless potash-lime glass, the reintroduction of the crafts of cutting and engraving on glass, the invention by H. Schwanhart of the process of etching on glass by means of hydrofluoric acid, and the rediscovery by J. Kunigel, who had directed the glass-houses at Potsdam in 1679, of the method of making copper-ruby glass.

Low Countries and the United Provinces.—The glass industry of the Low Countries was chiefly influenced by Italy and Spain, whereas German influence and technique predominated in the United Provinces. The history of glass-making in the provinces is almost identical with that of Germany. In the 17th and 18th centuries the processes of scratching, engraving and etching were brought to great perfection.

The earliest record of glass-making in the Low Countries consists in an account of payments made in 1453-1454 on behalf of Philip the Good of Burgundy to “Gossien de Vievuleg, Maître Vorrier de Lille” for a glass fountain and four glass plateaux. Schuermans has traced Italian glass-workers to Antwerp, Liège, Brussels and Namur. Antwerp appears to have been the headquarters of the Muranese, and Liège the headquarters of the Altarians. Guicciardini in his description of the Netherlands, in 1593, mentions glass as among the chief articles of export to England.

In the privilege of Freising, 1594, “Voyres de cristal à la fashon Venise,” was granted to Philippe de Gridolphi of Antwerp. In 1623 Anthony Miotti, a Muranese, addressed a petition to Philip IV. of Spain for permission to make glasses, vases and cups of fine crystal, equal to those of Venice, but to be sold at one-third less than Venetian glasses. In 1642 Jean Savonetti “gentilhomme Verrier de Murano” obtained a patent for making glasses in Brussels. The Low Country glasses are closely copied from Venetian models, but generally are heavier and less elegant. Owing to the fashion of Dutch and Flemish painters introducing glass vases and drinking-glasses into their paintings of still life, interiors and scenes of conviviality, Holland and Belgium at the present day possess more accurate records of the products of their ancient glass factories than any other countries.

Spain.—During the Roman occupation Pliny states that glass was made “per Hispanias” (Nat. Hist. xxxvi. 26. 66). Traces of Roman glass manufactories have been found in Valencia and Murcia, in the valleys which run down to the coast of Catalonia, and near the mouth of the Ebro. Little is known about the condition of glass-making in Spain between the Roman period and the 13th century. In the 13th century the craft of glass-making was practised by the Moors in Almeria, and was probably a survival from Roman times. The system of decorating vases and vessels by means of strands of glass trailed upon the surface in knots, zigzags and trellis work, was adopted by the Moors and is characteristic of Roman craftsmanship. Glass-making was continued at Finar de la Vidriera and at Al Castril de la Peña into the 17th century. The objects produced show no sign of Venetian influence, but are distinctly Oriental in form. Many of the vessels have four or as many as eight handles, and are decorated with serrated ornamentation, and with the trailed strands of glass already referred to. The glass is generally of a dark-green colour.

Barcelona has a long record as a centre of the glass industry. In 1324 a municipal edict was issued forbidding the erection of glass-furnaces within the city. In 1453 the glass-makers of Barcelona were permitted to form a guild. Jeronimo Paula, writing in 1491, says that glass vessels of various sorts were sent thence to many places, and even to Rome. Marinos Siculus, writing early in the 16th century, says that the best glass was made at Barcelona; and Gaspar Baneiros, in his Chronographia, published in 1562, states that the glass made at Barcelona was almost equal to that of Venice and that large quantities were exported.

The author of the Atlante español, writing at the end of the 18th century, says that excellent glass was still made at Barcelona on Venetian models. The Italian influence was strongly felt in Spain, but Spanish writers have given no precise information as to when it was introduced or whence it came. Schuermans has, however, discovered the names of more than twenty Italians who found their way into Spain, in some cases by way of Flanders,
either from Altare or from Venice. The Spanish glass-makers were very successful in imitating the Venetian style, and many specimens supposed to have originated from Murano are really Spanish. In addition to the works at Barcelona, the works which chiefly affected Venetian methods were those of Cadalso in the province of Toledo, founded in the 16th century, and the works established in 1680 at San Martin de Valdeiglesias in Avila. There were also works at Valdemadrid and at Villarfranca. In 1680 the works in Barcelona, Valdemadrid and Villarfranca are named in a royal schedule giving the prices at which glass was to be sold in Madrid. In 1772 important glass works were established at Recuenco in the province of Cuenca, mainly to supply Madrid. The royal glass manufactory of La Granja de San Ildefonso was founded about 1725; in the first instance for the manufacture of mirror plates, but subsequently for the production of vases and table-ware in the French style. The objects produced are mostly of white clear glass, cut, engraved and gilded. Engraved flowers, views and devices are often combined with decorative cutting. Don Sigismundo Brun is credited with the invention of permanent gilding fixed by heat. Spanish glass is well represented in the Victoria and Albert Museum.

France.—Pliny states that glass was made in Gaul, and there is reason to believe that it was made in many parts of the country and on a considerable scale. There were glass-making districts both in Normandy and in Poitou.

Little information can be gathered concerning the glass industry between the Roman period and the 14th century. It is recorded that in the 7th century the abbots of Wearmouth in England obtained artificers in glass from France; and there is a tradition that in the 11th century glass-workers migrated from Normandy and Brittany and set up works at Altare near Genoa.

In 1302 window glass, probably crown-glass, was made at Beza le Forêt in the department of the Eure. In 1416 these works were in the hands of Robin and Leban Guichard, but passed subsequently to the Le Vaillants.

In 1338 Humbert, the dauphin, granted a part of the forest of Chamborant to a glass-worker named Guionet on the condition that Guionet should supply him with vessels of glass.

In 1446 the abbess of St Croix of Poitiers received a gross of glasses from the glass-works of La Ferrière, for the privilege of gathering fern for the manufacture of potash.

In France, as in other countries, efforts were made to introduce Italian methods of glass-working. Schuermans in his researches discovered that during the 15th and 16th centuries many glass-workers left Altare and settled in France,—the Saroldi migrated to Poitou, the Ferri to Provence, the Massari to Lorraine, the Bormioli to Normandy, and the Guironet and Guionet to France. In 1454 King Henry IV. granted two "gentil hommes verriers" from Mantua to settle at Rouen in order to make "verres de cristal, verres dorés emaill et autres ouvrages qui se font en Venise." France assimilated the craft of glass-making, and her craftsmen acquired a wide reputation. Lorraine and Normandy appear to have been the most important centres. To Lorraine belong the well-known names Henniez, de Thilétry, de Thisac, de Houx, and to Normandy the names de Bongar, de Cacqueray le Vaillant and de Brossard.

In the 17th century the manufacture of mirror glass became an important branch of the industry. In 1665 a manufactory was established in the Faubourg St Antoine in Paris, and another at Tour-la-Ville near Cherbourg.

Louis Lucas de Néhou, who succeeded de Cacqueray at the works at Tour-la-Ville, moved in 1675 to the works in Paris. Here, in 1669, in conjunction with A. Thevart, he succeeded in perfecting the process of casting plate-glass. Mirror plates previous to the invention had been made from blown "doret" glass, and were consequently very limited in size. De Néhou's process of rolling molten glass poured on an iron table rendered the manufacture of very large plates possible.

The Manufactory Royale des Glaces was removed in 1693 to the Château de St. Gobain. In the 18th century the manufacture of vases de verre had become so neglected that the Academy of Sciences in 1759 offered a prize for an essay on the means by which the industry might be revived (Labarte, Histoire des arts industriels).

The famous Baccarat works, for making crystal glass, were founded in 1818 by d'Artigues.

English Glass.—The records of glass-making in England are extremely meagre. There is reason to believe that during the Roman occupation the craft was carried on in several parts of the country. Remains of a Roman glass manufactory of considerable extent were discovered near the Manchester Ship Canal at Warrington. Wherever the Romans settled glass vessels and fragments of glass have been found. There is no evidence to prove that the industry survived the withdrawal of the Roman garrison.

It is probable that the glass drinking-vessels, which have been found in pre-Christian Anglo-Saxon tombs, were introduced from Germany. Some are elaborate in design and bear witness to advanced technique of Roman character. In 675 Benedict Bishop, abbot of Wearmouth, was obliged to obtain glass-workers from France, and in 758 Cuthbert, abbot of Jarrow, appealed to the bishop of Mainz to send him artisans to manufacture "windows and vessels of glass, because the English were ignorant and helpless." Except for the statement in Bede that the French artisans, sent by Benedict, Bishop, taught their craft to the English, there is at present no evidence of glass having been made in England prior to the 13th century. In some deeds relating to the parish of Chiddingfold, in Surrey, of a date not later than 1230, a grant is recorded of twenty acres of land to Lawrence "vitrearius," and in another deed, of about 1280, the "ovenhusved" is mentioned as a boundary. This field has been identified, and pieces of crucible and fragments of glass have been dug up. There is another deed, dated 1300, which mentions one William "le verir" of Chiddingfold. About 1350 considerable quantities of colourless flat glass were supplied by John Alemayn of Chiddingfold for glazing the windows in St George's chapel, Windsor, and in the chapel of St Stephen, Westminster. The name Alemayn (Alean) suggests a foreign origin. In 1380 John Glasewright, a Staffordshire glass-worker, came to work at Shrewsbury, Kirdford, and there made brode-glas and vessels for Joan, widow of John Shertere.

There were two kinds of flat glass, known respectively as "bode-glas" and "Normandy" glass. The former was made, as described by Theophilus, from cylinders, which were split, reheated and flattened into square sheets. It was known as "English glass," and was made in London and elsewhere. Normandy glass was made from glass circles or disks. When, in after years, the process was perfected, the glass was known as "crown" glass. In 1447 English flat glass is mentioned in the contract for the windows of the Beauchamp chapel at Warwick, but disparagingly, as the contractor binds himself not to use it. In 1486, however, it is referred to in such a way as to suggest that it was superior to "Dutch, Venice or Normandy glass." The industry does not seem to have prospered, for when in 1567 an inquiry was made as to its condition, it was ascertained that only small rough goods were being made.

In the 17th century the fashion for using glass vessels of ornamental character spread from Italy into France and England. Henry VIII. had a large collection of glass drinking-vessels chiefly of Venetian manufacture. The increasing demand for Venetian drinking-glasses suggested the possibility of making similar glass in England, and various attempts were made to introduce Venetian workmen and Venetian methods of manufacture. In 1550 eight Muranese glass-blowers were working in or near the Tower of London. They had left Murano owing to lack of trade, but had been recalled, and appointed by the Council of Ten in Venice to be allowed to complete their contract in London. Seven of these glass-workers left London in the following year, but one, Joseph Casseri, remained and joined
Thomas Cavato, a Dutchman. In 1574 Jacob Verzellini, a fugitive Venetian, residing in Antwerp, obtained a patent for making drinking-glasses in London "such as are made in Murano." He established works in Crutched Friars, and to him is probably due the introduction of the use of soda-ash, made from seaweed and seashore plants, in place of the crude potash made from fern and wood ashes. His manufactory was burnt down in 1575, but was rebuilt. He afterwards moved his works to Winchester House, Broad Street. There is a small goblet (Pl. I., fig. 3) in the British Museum which is attributed to Verzellini. It is Venetian in character, of a brownish tint, with two white enamel rings round the body. It is decorated with diamond or steel-point etching, and bears on one side the date 1586, and on the opposite side the words "In God is al mi truist." Verzellini died in 1606 and was buried at Down in Kent. In 1592 the Broad Street works had been taken over by Jerome Bowes. They afterwards passed into the hands of Sir R. Mansel, and in 1618 James Howell, author of *Epistolae Ho-Elianae*, was acting as steward. The works continued in operation until 1641. During excavations in Broad Street in 1874 many fragments of glass were found; amongst them were part of a wine-glass, a square scent-bottle and a wine-glass stem containing a spiral thread of white enamel.

A greater and more lasting influence on English glass-making came from France and the Low Countries. In 1567 James Carré of Antwerp stated that he had erected two glass-houses at "Fernelol" (Fernold Wood in Sussex) for Normandy and Lorraine glass for windows, and had brought over workmen. From this period began the records in England of the great glass-making families of Hennezel, de Thierry, du Thisac and du Houx from Lorraine, and of de Bongar and de Cacqueray from Normandy. About this time glass-works were established at Ewhurst and Alford in Surrey, Lewes, Kirdford, Wisborough and Petworth in Sussex, and Sevenoaks and Penshurst in Kent. Beginning in Sussex, Surrey and Kent, where wood for fuel was plentiful, the foreign glass-workers and their descendants migrated from place to place, always driven by the fuel-hunger of their furnaces. They gradually made their way into Hampshire, Wiltshire, Gloucestershire, Staffordshire, Northumberland, Scotland and Ireland. They can be traced by cullet heaps and broken-down furnaces, and by their names, often mutilated, recorded in parish registers.

In 1610 a patent was granted to Sir W. Slingsby for burning coal in furnaces, and coal appears to have been used in the Broad Street works. In 1615 all patents for glass-making were revoked and a new patent issued for making glass with coal as fuel, in the names of Mansel, Zouch, Thelewall, Kellaway and Percival. To the last is credited the first introduction of covered crucibles to protect the molten glass from the products of combustion.

Simultaneously with the issue of this patent the use of wood for melting glass was prohibited, and it was made illegal to import glass from abroad. About 1617 Sir R. Mansel, vice-admiral and treasurer of the navy, acquired the sole rights of making glass in England. These rights he retained for over thirty years. During the protectorate all patent rights virtually lapsed, and mirrors and drinking-glasses were once more imported from Venice. In 1663 the duke of Buckingham, although unable to obtain a renewal of the monopoly of glass-making, secured the prohibition of the importation of glass for mirrors, coach plates, spectacles, tubes and lenses, and contributed to the revival of the glass industry in all its branches. Evelyn notes in his *Diary a visit in 1673 to the Italian glass-house at Greenwich, "where glass was blown of finer metal than that of Murano," and a visit in 1677 to the duke of Buckingham's glass-works, where they made huge "vases of mettal as cleare, ponderous and thick as chrystal; also looking-glasses far lager and better than any that came from Venice."

Some light is thrown on the condition of the industry at the end of the 17th century by the Houghton letters on the improvement of trade and commerce, which appeared in 1696. A few of these letters deal with the glass trade, and in one a list is given of the glass-works then in operation. There were 88 glass factories in England which are thus classified:

It is probable that the flint-glass of that date was very different from the flint-glass of to-day. The term flint-glass is now understood to mean a glass composed of the silicates of potash and lead. It is the most brilliant and the most colourless of all glasses, and was undoubtedly first perfected in England. Hartshorne has attributed its discovery to a London merchant named Tilson, who in 1663 obtained a patent for making "crystal glass." E. W. Hulme, however, who has carefully investigated the subject, is of opinion that flint-glass in its present form was introduced about 1730. The use of oxide of lead in glass-making was no new thing; it had been used, mainly as a flux, both by Romans and Venetians. The invention, if it may be regarded as one, consisted in eliminating lime from the glass mixture, substituting refined potash for soda, and using a very large proportion of lead oxide. It is probable that flint-glass was not invented, but gradually evolved, that potash-lead glasses were in use during the latter part of the 17th century, but that the mixture was not perfected until the middle of the following century.

The 18th century saw a great development in all branches of glass-making. Collectors of glass are chiefly concerned with the drinking-glasses which were produced in great profusion and adapted for every description of beverage. The most noted are the glasses with stout cylindrical legs (Plate I. fig. 9), containing spiral threads of air, or of white or coloured enamel. To this type of glass belong many of the Jacobite glasses which commemorate the old or the young Pretender.

In 1746 the industry was in a sufficiently prosperous condition to tempt the government to impose an excise duty. The report of the commission of excise, dealing with glass, published in 1835 is curious and interesting reading. So burdensome was the duty and so vexatious were the restrictions that it is a matter for wonder that the industry survived. In this respect England was more fortunate than Ireland. Before 1825, when the excise duty was introduced into Ireland, there were flourishing glass-works in Belfast, Cork, Dublin and Waterford. By 1850 the Irish glass industry had been practically destroyed. Injurious as the excise duty undoubtedly was to the glass trade generally, and especially to the flint-glass industry, it is possible that it may have helped to develop the art of decorative glass-cutting. The duty on flint-glass was imposed on the molten glass in the crucibles and on the finished goods. The manufacturer had, therefore, a strong inducement to enhance by every means in his power the selling value of his glass after it had escaped the exciseman's clutches. He therefore employed the best available art and skill in improving the craft of glass-cutting. It is the development of this craft in connexion with the perfecting of flint-glass that makes the 18th century the most important period in the history of English glass-making. Glass-cutting was a craft imported from Germany, but the English material so greatly surpassed Bohemian glass in brilliance that the Bohemian cut-glass was eclipsed. Glass-cutting was carried on at works in Birmingham, Bristol, Belfast, Cork, Dublin, Glasgow, London, Newcastle, Stourbridge, Whittington and Waterford. The most important centres of the craft were London, Bristol, Birmingham and Waterford (see Plate I., fig. 10, for oval cut-glass Waterford bowl). The finest specimens of cut-glass belong to the period between 1780 and 1810. Owing to the sacrifice of form to prismatic brilliance, cut-glass gradually lost its artistic value. Towards the middle of the 19th century it became the fashion to regard all cut-glass as barbarous, and services of even the best period were neglected and dispersed. At the present time scarcely anything is known about the origin of the few specimens of 18th-century English cut-glass...
GLASS, STAINED

which have been preserved in public collections. It is strange that so little interest has been taken in a craft in which for some thirty years England surpassed all competitors, creating a wave of fashion which influenced the glass industry throughout the whole of Europe.

In the report of the Excise Commission a list is given of the glass manufactories which paid the excise duty in 1833. There were 105 factories in England, 10 in Scotland and 10 in Ireland. In England the chief centres of the industry were Bristol, Birmingham, London, Manchester, Newcastle, Stourbridge and York. Plate-glass was made by Messrs Cookson of Newcastle, and by the British Plate Glass Company of Ravenhead. Crown glass was made by Messrs Chance & Hartley of Birmingham. The London glass-works were those of Apoley Pellatt of Blackfriars, Christie of Stangate, and William Holmes of Whitefriars. In Scotland there were works in Glasgow, Leith and Portobello. In Ireland there were works in Belfast, Cork, Dublin and Waterford. The famous Waterford works were in the hands of Hatchett & Co.

India.—Pliny states (Nat. Hist. xxvi. 26. 60) that no glass was to be compared to the Indian, and gives as a reason that it was made from broken crystal; and as early as the 19th century, a writer (ibid.) has said that exploits brought to Ocelis (Ghella near Bab-el-Mandeb) objects of glass. We have, however, very little knowledge of Indian glass of any considerable antiquity. A few small vessels have been found in the "topes," as in that at Manikiala in the Punjab, which probably dates from the Christian era; but they exhibit no remarkable character, and fragments found at Brahmanabad are hardly distinguishable from Roman glass of the imperial period. The chronicle of the Sinhalese kings, the Makowasam, however, asserts that mirrors of glittering glass were carried in procession in 366 n. c., and beads like gems, and windows with ornaments like jewels, are also mentioned at about the same date. If there really was an important manufacture of glass in Ceylon at this early time, that island perhaps furnished the Indian glass of Pliny. In the later part of the 17th century some glass decorated with enamel was made at Delhi. A specimen is in the Indian section of the South Kensington Museum. Glass is made in several parts of India—as Patna and Mysore—by very simple and primitive methods, and the results are correspondingly defective. Black, green, red, blue and yellow glasses are made, which contain in large proportion of alkali and are readily fusible. The greater part is worked into bangles, but some small bottles are blown (Buchanan, Journey through Mysore, i. 147, iii. 369).

Persia.—No very remarkable specimens of Persian glass are known in Europe, with the exception of some vessels of blue glass richly decorated with gold. These probably date from the 17th century, for Chardin tells us that the windows of the tomb of Shah Abbas II. (ob. 1666), at Kum, were "de cristal point d'or et d'azur." At the present day bottles and drinking-vessels are made in Persia which in texture and quality differ little from ordinary Venetian glass of the 16th or 17th centuries, while in form they exactly resemble those which may be seen in the engravings in Chardin's Travels.

China.—The history of the manufacture of glass in China is obscure, but the common opinion that it was learnt from the Europeans in the 17th century seems to be erroneous. A writer in the Mémoires concernant les Chinois (ii. 46) states on the authority of the annals of the Han dynasty that the emperor Wu-ti (140 B.C.) had a manufactury of the kind of glass called "lieu-li" (probably a form of opaque glass), that in the beginning of the 3rd century of our era the emperor Tsaoou-tsaoou received from the West a considerable present of glasses of all colours, and that soon after a glass-maker came into the country who taught the art to the natives.

The Wei dynasty, to which Tsaoou-tsaoou belonged, reigned in northern China, and at this day a considerable manufactury of glass is carried on at Po-shan-hien in Shantung, which it would seem has existed for a long period. The Rev. A. William- son (Journeys in North China, i. 131) says that the glass is extremely pure, and is made from the rocks in the neighbourhood.

The rocks are probably of quartz, i.e. rock crystal, a correspondence with Pliny's statement respecting Indian glass which seems deserving of attention.

Whether the making of glass in China was an original discovery of that ingenious people, or was derived via Ceylon from Egypt, cannot perhaps be now ascertained; the manufacture has, however, never greatly extended itself in China. The case has been the converse of that of the Romans; the latter had no fine pottery, and therefore employed glass as the material for vessels of an ornamental kind, for table services and the like. The Chinese, on the contrary, having from an early period but excelled in silks and silks, have a predilection about the use of glass. A Chinese writer, however, mentions the manufacture of a huge vase in a.d. 627, and in 1154 Edrisi (first climate, tenth section) mentions Chinese glass. A glass vase about a foot high is preserved at Nara in Japan, and is alleged to have been placed there in the 8th century. It seems probable that this is of Chinese manufacture. A writer in the Mémoires concernant les Chinois (ii. 463 and 477), writing about 1770, says that there was then a glass-house at Peking, where every year a good number of vases were made, some requiring great labour because the glass was blown (Fieren est souffle); meaning no doubt that the ornamentation was produced not by blowing and moulding, but by cutting. This factory was, however, merely an appendage to the imperial magnificence. The earliest articles of Chinese glass the date of which has been ascertained, which have been noticed, are some bearing the name of the emperor Kienlung (1735-1795), one of which is in the Victoria and Albert Museum.

In the manufacture of ornamental glass the leading idea in China seems to be the imitation of natural stones. The coloured glass is usually not of one bright colour throughout, but semi-transparent and marbled; the colours in many instances are singularly fine and harmonious. As in 1770, carving or cutting is the chief method by which ornament is produced, the vessels being blown very solid.

GLASS, STAINED. All coloured glass is, strictly speaking, "stained" by some metallic oxide added to it in the process of manufacture. But the term "stained glass" is popularly, as well as technically, used in a more limited sense, and is understood to refer to stained glass windows. Still the words "stained glass" do not fully describe what is meant; for the glass in colourless glass for windows is for (Dartmouth) glass, not a form only, but painted. Such painting was, however, until comparatively modern times, used only to give details of drawing and to define form. The colour in a stained glass window was not painted on the glass but incorporated in it, mixed with it in the making—whence the term the "pot-metal" by which self-coloured glass is known, i.e. glass coloured in the melting pot.

A medieval window was consequently a patchwork of variously coloured pieces. And the earlier its date the more surely was it a mosaic, not in the form of tesserae, but in the manner known as "opus sectile." Shaped pieces of coloured glass were, that is to say, put together like the parts of a puzzle. The
nearest approach to an exception to this rule is a fragment at the Victoria and Albert Museum, in which actual tesserae are fused together into a solid slab of many-coloured glass, in effect a window panel, through which the light shines with all the brilliancy of an Early Gothic window. But apart from the fact that the design proves in this case to be even more effective with the light upon it, the use of gold leaf in the tesserae confirms the presumption that this work, which (supposing it to be genuine) would be Byzantine, centuries earlier than any coloured windows that we know of, and entirely different from them in technique, is rather a specimen of fused mosaic that happens to be translucent than part of a window designedly executed in tesserae.

The Eastern (and possibly the earlier) practice was to set chips of coloured glass in a heavy fretwork of stone or to imbide them in plaster. In a medieval window they were held together by strips of lead, in section something like the letter H, the upright strokes of which represent the "tapes" extending on either side well over the edges of the glass, and the crossbar the connecting "core" between them. The leading was soldered together at the points of junction, cement or putty was rubbed into the crevices between glass and lead, and the window was attached (by means of copper wires soldered on to the leads) to iron saddle-bars let into the masonry.

Stained glass was primarily the art of the glazier; but the painter, called in to help, asserted himself more and more, and eventually took it almost entirely into his own hands. Between the period when it was glazier's work eked out by painting, and when it was painter's work with the aid of the glazier lies the entire development of stained and painted window-making. With the eventual endeavour of the glass painter to do without the glazier, and to get the colour by painting in translucent enamels upon colourless glass, we have the beginning of a form of art no longer monumental and comparatively trivial.

This evolution of the painted window from a patchwork of little pieces of coloured glass explains itself when it is remembered that coloured glass was originally not made in the big sheets produced nowadays, but at first in jewels to look as much as possible like rubies, sapphires, emeralds and other precious stones, and afterwards in rounds and sheets of small dimensions. Though some of the earliest windows were in the form of pure glazing ("leded-lights"), the addition of painting seems to have been customary from the very first. It was a means of rendering detail not to be got in lead. Glazing affords by itself scope for beautiful pattern work; but the old glaziers never carried their art as far as they might have done in the direction of ornament; their aim was always in the direction of picture; the idea was to make windows serve the purpose of coloured story books. That was beyond the art of the glazier. It was easy enough to represent the drapery of a saint by red glass, the ground on which he stood by green, the sky above by blue, his crown by yellow, the scroll in his hand by white, and his flesh by brownish pink; but when it came to showing the folds of red drapery, blades of green grass, details of goldsmith's work, lettering on the scroll, the features of the face—the only possible way of doing it was by painting. The use of paint was confined at first to an opaque brown, used, not as colour, but only as a means of stopping out light, and in that way defining comparatively delicate details within the lead lines. These themselves outlined and defined the main forms of the design. The pigment used by the glass painter was of course vitreous: it consisted of powdered glass and sundry metallic oxides (copper, iron, manganese, &c.), so that, when the pieces of painted glass were made red hot in the kiln, the powdered glass became fused to the surface, and with it the dense colouring matter also. When the pieces of painted glass were afterwards glazed together and seen against the light, the design appeared in the brilliant colour of the glass; it was laid down in the uniform black into which, at a little distance, leadwork and painting lines became merged.

It needed solid painting to stop out the light entirely: thin paint only misled it. And, even in early glass, thin paint was used, whether to subdue crude colour or to indicate what little shading a 13th-century draughtsman might desire. In the present state of old glass, the surface often quite disintegrated, it is difficult to determine to what extent thin paint was used for either purpose. There must always have been the temptation to make tint do instead of solid lines; but the more workmanlike practice, and the usual one, was to get difference of tint, as a pen-draughtsman does, by lines of solid opaque colour. In comparatively colourless glass (grisaille) the pattern was often made to stand out by cross-hatching the background; and another common practice was to coat the glass with paint, fill over, and scrape the design out of it. The effect in the first proceeding was to lower the tone of the glass without dirtying the colour, as a smear of thin paint would do.

Towards the 14th century, when Gothic design took a more naturalistic direction, the desire to get something like modelling made it necessary to carry painting farther, and they got rid to some extent of the ill effect of shading-colour smeared on the glass by stippling it. This not only softened the tint and allowed of gradation according to the amount of stippling, but let some light through, where the bristles of the stippling-tool took up the pigment. Shading of this kind enforced by touches of strong brushwork, cross-hatching and some scratching out of high lights was the method of glass painting adopted in the 14th century.

Glass was never at the best a pleasant surface to paint on; and glass painting, following the line of least resistance, developed in the later Gothic and early Renaissance periods into something unlike any other form of painting. The outlines continued to be traced upon the glass and fixed in the fire; but, after that, the process of painting consisted mainly in the removal of paint. The entire surface of the glass was coated with an even "mat" of pale brown; this was allowed to dry; and then the high lights were rubbed off, and the modelling was got by scrubbing away the paint with a dry hog-hair brush, more or less, according to the gradations required. Perfect modelling was got by repeating the operation—how often depended upon the dexterity of the painter. A painter's method is partly the outcome of his individuality. One man would float on his colour and manipulate it to some extent in the moist state; another would work entirely upon the dry matt. Great use was made of the pointed stick with which sharp lines of light were easily scraped out; and in the 16th century Swiss glass painters, working upon a relatively small scale, got their modelling entirely with a needle-point; scraping away the paint just as an etcher scratches away the varnish from his etching plate. The practice of the two craftsmen is, indeed, identical, though the one scratches out what are to be black lines and the other lines of light. In the end, then, though a painter would always use touches of the brush to get crisp lines of dark, the manipulation of glass painting consisted more in erasing lights than in painting shadows, more in rubbing out or scraping off paint than in putting it on in brush strokes.

So far there was no thought of getting colour by means of paint. The colour was in the glass itself, permeating the mass ("pot-metal"). There was only one exception to this—ruby glass, the colour of which was so dense that red glass thick enough for its purpose would have been practically obscure; and so they made a colourless pigment which could be used only with red glass. This led to a practice which forms an exception to the rule that in "pot-metal" glass every change of colour, or from colour to white, is got by the use of a separate piece of glass. It was possible in the case of this "flushed" ruby to grind away portions of the surface and thus obtain white on red or red on white. Eventually they made coated glass of blue and other colours, with a view to producing similar effects by abrasion. (The same result is arrived at nowadays by means of etching. The skin of coloured glass, in old days laboriously ground or cut away, is now by eating off by fluoric acid.) One other exceptional expedient in colouring had very considerable effect upon the development of glass design from about the beginning of the 14th century. The discovery that a solution of silver applied to glass would under the action of the
fire stain it yellowed the glass painter to get yellow upon colourless glass, green upon grey-blue, and (by staining only the abraded portions) yellow upon blue or ruby. This yellow was neither enamel nor pot-metal colour, but a stain, the only one stain active in glass-painting distinct from the glass maker. It varied in colour from pale lemon to deep orange, and was singularly pure in quality. As what is called “white” glass became purer and was employed in greater quantities it was lavishly used; so much so that a brilliant effect of silvery white and golden yellow is characteristic of later Gothic windows.

The last stage of glass painting was the employment of enamel not for stopping out light but to get colour. It began to be used in the early 15th century. This is where the enamel has crumbled off. It varied in colour no longer in the glass but it marks quite a new departure in technique. Enamel colour was finely powdered colourless glass mixed with gum or some such substance into a pigment which could be applied with a brush. When the glass painted with it was brought to a red heat in the oven, the powdered glass melted and was fused to it, just like the opaque brown employed from the very beginning of glass-painting.

This process of enamelling was hardly called for in the interests of art. Even the red flesh-colour (borrowed from the Limoges enamellers upon copper) did not in the least give the quality of flesh, though it enabled the painter to suggest by contrast the whiteness of a man’s beard. For the brighter enamel colours, they had nothing like the depth or richness of “stained” glass. What enamel really did was to make easy much that had been impossible in mosaic, as, for example, to represent upon the very smallest shield of arms any number of “charges” all in the correct tinctures. It encouraged the minute workmanship characteristic of Swiss glass painting; and though this was not altogether inappropriate to domestic window panes, the painter was tempted by it to depart from the simplicity and breadth of design inseparable from the earlier mosaic practice. In the end he introduced coloured glass only where he could hardly help it, and glazed the great part of his window in rectangular panes of clear glass, upon which he preferred to paint his picture in opaque brown and translucent enamel colours.

Enamel upon glass has not stood the test of time. Its presence is usually to be detected in old windows by specks of light shining through them. This is where the enamel has crumbled off. There is a very good reason for that. Enamel must melt at a temperature at which the glass it is painted on keeps its shape. The lower the melting point of the powdered glass the more easily it is fused. The painter is consequently inclined to use enamel of which the contraction and expansion is much greater than that of his glass—with the result that, under the action of the weather, the colour is apt to work itself free and expose the bare white glass beneath. The only enamel which has held its own is that of the Swiss glass-painters of the 16th and 17th centuries. The domestic window panes they painted may not in all cases have been tried by the sudden changes of atmosphere to which church windows are subject; but credit must be given them for exceptionally skilful and conscientious workmanship.

The story of stained glass is bound up with the history of architecture, to which it was subsidiary, and of the church, which was its patron. Its only possible course of development was in the wake of church building. From its very inception it was Gothic and ecclesiastical. And, though it survived the upheaval of the Renaissance and was turned to civil and domestic use, it is to church windows that we must go to see what stained glass really was—or is; for time has been kind to it. The charm of medieval glass lies to a great extent in the material, and especially in the inequality of it. Chemically impure and mechanically imperfect, it was rarely crude in tint or even in texture. It shaded off from light to dark according to its thickness; it was speckled with air bubbles; it was streaked and clouded; and all these imperfections of manufacture went to perfection of colour. And age has improved it: the want of homogeneity in the material has led to the disintegration of its surface; soft particles in it have been dissolved away by the action of the weather, and the surface, pitted like an oyster-shell, reflects the light in a way which adds greatly to the effect; at the same time there is no roothold for the lichen which (like the curtains of black cobwebs) veils and gives mystery to the colour. An appreciable part of the beauty of old glass is the result of age and accident. In that respect no new glass can compare with it. There is, however, no such thing as “the lost secret” of glass-making. It is no secret that age mellows.

Stained and painted glass is commonly apportioned to its “period,” Gothic or Renaissance, and further to the particular phase of the style to which it belongs. C. Winston, who was the first to inquire thoroughly into the history of glass, divided Gothic windows into Early English (to c. 1250), Decorated (c. 1350) and Perpendicular (c. 1350). These dates will do. But the transition from one phase of design to another is never so sudden, nor so easily defined, as any table of dates would lead us to suppose. The old style lingered in one district long after the new fashion was flourishing in another. Besides, the English periods do not quite coincide with those of other countries. France, Germany and the Low Countries count for much in the history of stained glass; and on these two places of primary interest may we begin. There was, for example, scarcely any 13th-century Gothic in Germany, where the “geometric” style, equivalent to our Decorated, was preceded by the Romanesque period; in France the Flamboyant took the place of our Perpendicular; and in Italy Gothic never properly took root at all. All these considered, a rather rough and ready division presents the least difficulty to the student of old glass; and it will be found convenient to think of Gothic glass as (1) Early, (2) Middle and (3) Late, and of the subsequent windows as (i) Renaissance and (2) Late Renaissance. The three periods of Gothic correspond approximately to the 13th, 14th and 15th centuries. The limits of the two periods of the Renaissance are not so easily defined. In the first part of the 16th century (in Italy long before that) the Renaissance and Gothic periods overlapped; in the latter part of it, glass painting was already on the decline, and in the 17th and 18th centuries it sank to deeper depths of degradation.

The likeness of early windows to translucent enamel (which is also glass) is obvious. The lines of lead glazing correspond to the “cloisons” of Byzantine goldsmith’s work. Moreover, the extreme minuteness of the leading (not always either mechanically necessary or architecturally desirable) suggests that the starting point of all this gorgeous illumination was the idea of reproducing on a grandiose scale the jewelled effect produced in small by cloisonné enamelists. In other respects the earliest glass shows the influence of Byzantine tradition. It is mainly according to the more or less Byzantine character of its design and draughtsmanship that archaeologists ascribe certain remains of old glass to the 12th or the 11th century. Apart from documentary or direct historic evidence, it is not possible to determine the precise date of any particular fragment. In the “restored” windows at St Denis there are remnants of glass belonging to the year 1108. Elsewhere in France (Reims, Angers, Le Mans, Chartres, &c.) there is to be found very early glass, some of it probably not much later than the end of the 10th century, which is the date confidently ascribed to certain windows at St Remi (Reims) and at Tegernsee. The rarer the specimen the greater may be its technical and antiquarian interest. But, even if we could be quite sure of its date, there is not enough of this very early work, and it does not sufficiently distinguish itself from what followed, to count artistically for much. The glory of early glass belongs to the 13th century.

The design of windows was influenced, of course, by the conditions of the workshop, by the nature of glass, the difficulty of shaping it, the way it could be painted, and the necessity of lead glazing. The place of glass in the scheme of church decoration led to a certain severity in the treatment of it. The growing desire to get more and more light into the churches, and the consequent manufacture of purer and more transparent
glass, affected the glazier's colour scheme. For all that, the fashion of a window was, mutatis mutandis, that of the painting, carving, embroidery, goldsmith's work, enamel and other craftsmanship of the period. The design of an ivy triptych is very much that of a three-light window. There is a little enamelled shrine of German workmanship in the Victoria and Albert Museum which might almost have been designed for glass; and the famous painted ceiling at Hildesheim is planned precisely on the lines of a medallion window of the 14th century. By that time glass had fallen into ways of its own, and there was credence in various types of design which we now recognize as characteristic of the first great period, in some respects the greatest of all.

Pre-eminently typical of the first period is the "medallion window." Glaziers began by naively accepting the iron bars across the light as the basis of their composition, and planned a window as a series of panels, one above the other, between the horizontal crossbars and the upright lines of the border round it. The next step was to mitigate the extreme severity of this composition by the introduction of a circular or other medallion within the square boundary lines. Eventually these were abandoned altogether, the iron bars were shaped according to the pattern, and there was evolved the "medallion window," in which the main divisions of the design are emphasized by the strong bands of iron round them. Medallions were invariably devoted to picturing scenes from Bible history or from the lives of the saints, set forth in the simplest and most straightforward manner, the figures all on one plane, and as far as possible cut-clear against a sapphire-blue or ruby-red ground. Scenery was not so much a matter of sight as of force. An arch-cathedral duty for architecture, any scrap of foliated ornament for landscape. Simplicity of silhouette was absolutely essential to the readableness of pictures on the small scale allowed by the medallion. As it is, they are so difficult to decipher, so confused and broken in effect, as to give rise (the radiating shape of "rose windows" aiding) to the misconception that the design of early glass is kaleidoscopic—which it is not. The intervals between subject medallions were filled in England (Canterbury) with scrollwork, in France (Chartres) more often with geometric diaper, in which last sometimes the red and blue merge into an unpleasing purple. Design on this small scale was obviously unsuited to distant windows. Clerestory lights were occupied by figures, sometimes on a gigantic scale, entirely occupying the window, except for the border and perhaps the slightest pretence of a niche. This arrangement lent itself to broad effects of colour. The drawing may be rude; at times the figures are grotesque; but the general impression is one of mysterious grandeur and solemnity.

The depth and intensity of colour in the windows so far described comes chiefly from the quality of the glass, but partly also from the quality of the light in which the stained glass was seen. It was the custom at that period to illuminate a rich window with white. If light was wanted they worked in white, enlivened, it might be, by colour. Strictly speaking, 13th-century glass was never colourless, but of a greenish tint, due to impurities in the sand, potash or other ingredients; it was of a hazy consistency, too; but it is convenient to speak of all would-be-clear glass as "white." The greyish windows in which it prevails are technically described as "in grisaille." There are examples (Salisbury, Châlons, Bonlieu, Angers) of "plain glazing" in grisaille, in which the lead lines make very ingenious and beautiful pattern. In the more usual case of "painted grisaille" the lead lines still formed the groundwork of the design, though supplemented by foliated or other detail, boldly outlined in strong brown and emphasized by a background of cross-hatching. French grisaille was frequently all in white (Reims, St Jean-aux-Bois, Sens), English work was usually enlivened by bands and bosses of colour (Salisbury); but the general effect of the window was still grey and silvery, even though there might be distributed about it (the "superi" sisters, York minster) a fair amount of coloured glass. The use of grisaille is sufficiently accounted for by considerations of economy and the desire to get light; but it was also in some sort a protest (witness the Cistercian interdict of 1134) against undue indulgence in the luxury of colour. At this stage of its development it was confined strictly to patternwork; figure subjects were always in colour. For all that, some of the most restful and entirely satisfying work of the 14th century was in grisaille (Salisbury, Chartres, Reims, &c.).

The second or Middle period of Gothic glass marks a stage between the work of the Early Gothic artist who thought out his design as glazing, and that of the later draughtsmen who conceived of something to be painted. It represents many of the methods of greater interest. Canopywork, begun in the 12th century for the sake of its durability and to remove the anomaly of the clerestory windows, was still popular in the 14th century; the departure from the severity of Early work. It was the period of more naturalistic design; and a touch of nature is more easily appreciated than architectural fitness. Middle Gothic glass, halting as it does between the relatively rude mosaic of early times and the painter-like accomplishment of fully-developed glass painting, has not the salient merits of either. In the matter of tone also it is intermediate between the deep, rich, sober harmonies of Early windows and the lighter, brighter, gayer colouring of later glass. Now for the first time grisaille ornament and coloured figurework were introduced into the same window. And this was done in a very judicious way, in alternate bands of white and deep rich colour, binding together the long lights into which windows were by this time divided (chapter-house, York minster). A similar horizontal tendency of design is noticeable in windows in which the figures are enshrined under canopies, henceforth a feature in glass design. The pinnacle work falls into pronounced bands of brassy yellow between the tiers of figures (nave, York minster) and serves to correct the vertical lines of the medallion glass. Canopied figures grew somewhat to such dimensions as quite to overpower the figure it was supposed to frame; but, then, the sense of scale was never a directing factor in Decorated design. A more interesting form of ornament is to be found in Germany, where it was a pleasing custom (Regensburg) to fill windows with conventional foliage without figurework. There is abundance of Middle Gothic glass in England (Yorks, Wells, Ely, Oxford), but the best of it, such as the great East window at Gloucester cathedral, has features more characteristic of the 15th than of the 14th century.

The keynote of Late Gothic glass is brilliancy. It had a silvery quality. The 15th century was the period of white glass, which approached at last to colourlessness, and was employed in great profusion. Canopywork, more universal than ever, was represented almost entirely in white touched with yellow stain, but not in sufficient quantities to impair its silveriness. Whatever the banality of the idea of imitation stonework in glass, the effect of thus framing coloured pictures in delicate white is admirable: at last we have white and colour in perfect combination. Fifteenth-century figurework contains usually a large proportion of painted glass; the third, fourth, and fifth lights of the nave is often white in the drapery; in short, there is always white enough in the figures to connect them with the canopywork and make the whole effect one. The preference for white will be better appreciated when it is stated that very often not a fifth or sixth part of the glass is coloured. It is no uncommon thing to find figures draped entirely in white with only a little colour in the background; and figurework all in grisaille upon a ground of white latticework is quite characteristic of Perpendicular glass.

One of the most typical forms of Late English Gothic canopy is where (York minster) its slender pinnacles fill the upper part of the window, and its solid base frames a picture in small of some episode in the history of the personage depicted as large as life above. A much less satisfactory continental practice was to enrich only the lower half of the window with stained glass and to make shift above (Munich) with "roundels" of plain white glass, the German equivalent for diamond latticework. A sign of later times is the way pictures spread beyond the confines of a single light. This happened by degrees. At first the connexion between the figures in separate window openings was only in idea, as when a central figure of the crucified Christ was flanked by the Virgin and St John in the side lights. Then the arms of the cross would be carried through, or as it were
1. EARLY GLAZING. From S. Serge, Angers, Grisaille, with colour introduced in the small circles.

II. AN EARLY BORDER. From S. Kunibert, Cologne.

III. PORTION OF AN EARLY MEDALLION WINDOW. From Canterbury, showing the plan of the design and the ornamental details.

IV. AN EARLY FIGURE FROM LYONS. Showing the leading of the eyes, hair, nimbus, and drapery.

V. DECORATED LIGHTS. From S. Urbain, Troyes, showing both the influence of the early period in the figures, and the beginning of the architectural canopy.

VI. TYPICAL DECORATED CANOPY. From Exeter.

Nos. I., II., III., IV., VI. are taken from illustrations in Lewis F. Day, Windows, by permission of B. T. Batsford.

II. A WINDOW FROM AUCH. Illustrating the transition from Perpendicular to Renaissance.

III. A SIXTEENTH-CENTURY JESSE WINDOW. From Beauvais (source as in Fig. I).

IV. PORTION OF A RENAISSANCE WINDOW: From Montmorency, showing the perfection of glass painting.

From Lucien Magne, *Œuvre des Peintres Verriers Français*, by permission of Firmin-Didot et Cie.
behind, the mullions. The expansion to a picture right across the window was only a question of time. Not that the artist ventured as yet to disregard the architectural setting of his picture—that happened later on—but that he often composed it with such cunning reference to intervening stonework that it did not interfere with it. It has been argued that each separate light of a window ought to be complete in itself. On the other hand it has proved possible to make due acknowledgment of architectural conditions without cramping design in that way. There can be no doubt as to the variety and breadth of treatment gained by structuring the whole window as field for design. And, when a number of lights go to make a window, it is the window, and no separate part of it, which is the main consideration.

By the end of the Gothic period, glass painters proceeded on an entirely different method from that of the 13th century. The designer of early days began with glazing: he thought in mosaic and leadwork; the lines he first drew were the lines of glazing; painting was only a supplementary process, enabling him to get what lead lines would not give. The Late Gothic draughtsman began with the idea of painting; glazing was to him of secondary importance; he reached a stage (Creation window, Great Malvern) where it is clear that he first sketched out his design, and then bethought him how to glaze it in such wise that the leadwork (which once boldly outlined everything) should not interfere with the picture. The artful way in which he would introduce little bits of colour into a window almost entirely white, makes it certain that he had always at the back of his mind the consideration of the glazing to come. So long as he thought of that, and did not resent it, all was fairly well with the glass-painting, but there came a point where he found it difficult, if not impossible, to reconcile the extreme delicacy of his painting upon white glass with the comparatively brutal strength of his lead lines. It is here that the conditions of painting and glazing clash at last.

It must not be supposed that Late Gothic windows were never by any chance rich in colour. Local conservatism and personal predilection prevented anything like monotonous progress in a single direction. There is (St Schald, Nuremberg) Middle Gothic glass as dense in colour as any 13th-century work, and Late Gothic (Troyes cathedral) which, from its colour, one might take at first to be a century earlier than it is. In Italy (Florence) and to some extent in Spain (Seville) it was the custom to make canopywork so rich in colour that it was more like part of the picture than a frame to it. But that was by exception. The tendency was towards lighter windows. Glass itself was less deeply stained when painters depended more upon their power of deepening it by paint. It was the seeking after delicate effects of painting, quite as much as the desire to let light into the church, which determined the tone of later windows. The classical scope of the glass-painter was more or less transcended. It is convenient to draw a line between Gothic art and Renaissance. Nothing is easier than to say that windows in which crocketed canopywork occurs are Gothic, and that those with arabesque are Renaissance. But that is an arbitrary distinction, which does not really distinguish. Some of the most beautiful work in glass, such as example for example as that at Auch, is so plainly intermediate between two styles that it is impossible to describe it as anything but "transitional." And, apart from particular instances, we have only to look at the best Late Gothic work to see that it is informed by the new spirit, and at fine Renaissance glass to observe how it conforms to Gothic traditions of workmanship. The new idea gave a spurt to Gothic art; and it was Gothic impetus which carried Renaissance glass painting to the summit of accomplishment reached in the first half of the 16th century. When that subsided, and the pictorial spirit of the age at last prevailed, the bright days of glass were at an end. If we have to refer to the early Renaissance as the culminating period of glass painting, it is because the technique of an earlier period found in it freer and fuller expression. With the Renaissance, designing broke free from the restraints of tradition.

An interesting development of Renaissance design was the framing of pictures in golden-yellow arabesque ornament, scarcely architectural enough to be called canopywork, and reminiscent rather, of beaten goldsmith's work than of stone carving. This did for the glass picture what a gilt frame does for a painting in oil. Very often framework of any kind was dispensed with. The primitive idea of accepting bars and mullions as boundaries of design, and filling the compartments formed by them with a medley of little subjects, lingered on. The result was delightfully broken colour, but inevitable confusion; for brilliant as they are, glass pictures not effectively separate glass pictures.

There was no longer in late glass any pretence of preserving the plane of the window. It was commonly designed to suggest that one saw out of it. Throughout the period of the Renaissance, architectural and landscape backgrounds play an important part in design. An extremely beautiful feature in early 16th-century French glass pictures (Rouen, &c.) is the little peep of distant country delicately painted upon the pale-blue glass which represents the sky. In larger work landscape and architecture were commonly painted upon white (King's College, Cambridge). That to restrain effect was always happiest when one or other of these conventions was adopted. Canopywork never went quite out of fashion. For a long while the plan was still to frame coloured pictures in white. Theoretically this is no less effectually to be done by Italian than by Gothic shirnework. Practically the architectural setting assumed in the 16th century more and more the aspect of background to the figures, and, in order that it should take its place in the picture, they painted it so heavily that it no longer told as white. Already in van Orley's magnificent transept windows at St Gudule, Brussels, the great triumphal arch of the mosaic as a background is their particular pleasure. (The donors take more and more the place of holy personages) tells dark against the clear ground. There came a time, towards the end of the century, when, as in the wonderful windows at Gouda, the very quality of white glass is lost in heavily painted shadow.

The pictorial ambition of the glass painter, active from the first, was kept for centuries within the bounds of decoration. Medallion subjects were framed in ornament, standing figures in canopywork, and pictures were conceived with regard to the window and its place in architecture. Severity of treatment in design may have been due more to the limitations of technique than restraint on the part of the painter. The point is that it led to unsurpassed results. It was by absolute reliance upon the depth and brilliancy of self-coloured glass that all the beautiful effects of early glass were obtained. We need not compare early mosaic with later painted glass; each was in its way admirable; but the early manner is the more peculiar to glass, if not the more proper to it. The ruder and more archaic design gives in fullest measure the glory of glass—for the loss of which no quality of painting ever got in glass quite makes amends. The pictorial effects compatible with glass design are those which go with stained glass. The ideal of a "primitive" Italian painter was more or less to be realized in glass: that of a Dutch realist was not. It is astonishing what glass painters did in the way of light and shade. But the fact remains that heavy painting obscured the glass, that shadows rendered in opaque surface-colour lacked translucency, and that in seeking before all things the effects of shadow and relief, glass painters of the 17th century fell short of the qualities on the one hand of glass and on the other of painting.

The course of glass painting was not so even as this general survey of its progress might seem to imply. It was quickened here, impeded there, by historic events. The art made a splendid start in France; but its development was stayed by the disasters of war, just when in England it was thriving under the Plantagenets. It revived again under Francis I. In Germany it was with the prosperity of the free cities of the Empire that glass painting prospered. In the Netherlands it blossomed out under the favour of Charles V. In the Swiss Confederacy its direction was determined by civil and domestic instead of church patronage. In most countries there were in different districts local schools of glass painting, each with its own character of its own, and to what extent design was affected by national temperament it is not easy to say. The marked divergence of the Flemish from the
French treatment of glass in the 16th century is not entirely due to a preference on the one part for colour and on the other for light and shade, but is partly owing to the circumstance that, whilst in France design remained in the hands of craftsmen, whose trade was glass painting, in the Netherlands it was entrusted by the emperor to his court painter, who concerned himself as little as possible with a technique of which he knew nothing. If in France we come also upon the names of well-known artists, they seem, like Jean Cousin, to have been closely connected with glass painting; they designed so like glass painters that they might have begun their artistic career in the workshops.

The attribution of fine windows to famous artists should not be too readily accepted; for, though it is a foible of modern times to father whatever is noteworthy upon some great name, the masterpieces of medieval art are due to unknown craftsmen. In Italy, where glass painting was not much practised, and it seems to have been the custom either to import glass painters as they were wanted or to get work done abroad, it may well be that designs were supplied by artists more or less distinguished. Ghisberti and Donatello may have had a hand in the cartoons for the windows of the Duomo at Florence; but it is not to any such extent that we can give the entire credit of design so absolutely in the spirit of colour decoration. The employment of artists not connected with glass design would go far to explain the great difference of Italian glass from that of other countries. The 14th-century work at Assisi is more correctly described as "Trecento" than as Gothic, and the "Quattrocento" windows at Florence are as different as could be from Perpendicular work. One compares them instinctively with Italian paintings, not with glass elsewhere. And so with the 15th-century Italian glass.

The superb 16th-century windows of William of Marseilles at Anwerp, in which painting is carried to the furthest possible short of sacrificing the pure quality of glass, are more according to contemporary French technique. Both French and Italian influence may be traced in Spanish glass (Avila, Barcelona, Burgos, Granada, Leon, Seville, Toledo). Some of it is said to have been executed in France. If so it must have been done to Spanish order. The coarse effectiveness of the design, the strength of the colour, the general robustness of the art, are characteristically Spanish; and nowhere this side of the Pyrenees do we find detail on a scale so enormous.

We have passed by, in following the progressive course of craftsmanship, some forms of design, peculiar to no one period but very characteristic of glass. The "quarry window," barely referred to, its diamond-shaped or oblong panes painted, richly bordered, relieved by bosses of coloured ornament often heraldic, is of constant occurrence. Entire windows, too, were from first to last given up to heraldry. The "Jesse window" occurs in every style. According to the fashion of the time the "Stem of Jesse" burst out into conventional foliage, vine branches or arbitrary scrollwork. It appealed to the designer by the scope it gave for freedom of design. He found, went on, for fantastic imagination in the representation of the "Last Judgment," to which the west window was commonly devoted. And there are other schemes in which he delighted; but this is not the place to dwell upon them.

The glass of the 17th century does not count for much. Some of the best in England is the work of the Dutch van Linge family (Wadham and Balliol Colleges, Oxford). What glass painting came to in the 18th century is nowhere better to be seen than in the great west window of the ante-chapel at New College, Oxford. That is all Sir Joshua Reynolds and the best painters of his day could do between them. The very idea of employing a china painter shows how entirely the art of the glass painter had died out.

It re-awoke in England with the Gothic revival of the 19th century; and the Gothic revival determined the direction modern glass should take. Early Victorian doings are interesting only as marking the steps of recovery (cf. the work of T. Willement in the choir of the Temple church; of Ward and Nixon, lately removed from the south transept of Westminster Abbey; of Waley). Better things begin with the windows at Westminster inspired by A. C. Pugin, who exercised considerable influence over his contemporaries. John Powell (Hardman & Co.) was an able artist content to walk, even after that master's death, reverently in his footsteps.

Charles Winston, whose "Hints on Glass Painting" was the first real contribution towards the understanding of Gothic glass, and who, by the aid of the Powells (of Whitefriars) succeeded in getting something very like the texture and colour of old glass, was more learned in ancient ways of workmanship than appreciative of the art resulting from them. (He is responsible for the Munich glass in Glasgow Cathedral.) So it is likely that the light and the line, as we have seen, were entrusted by exception to W. Dyce, E. Poynter, D. G. Rossettii, Ford Madox Brown or E. Burne-Jones, glass, from the beginning of its recovery, fell into the hands of men with a strong bias towards archaeology. The architects foremost in the Gothic revival (W. Butterfield, Sir G. Scott, G. E. Street, &c.) were all inclined that way; and, as they had the placing of commissions for windows, they controlled the policy of glass painters. Designers were constrained to work in the pedantically archaeological manner prescribed by architectural fashion.

Unwillingly as it may have been, they made mock-medieval windows, the interior of which was filled with the operations of the human hand; but they knew their trade; and when an artist like John Clayton (master of a whole school of later glass painters) took a window in hand (St Augustine's, Kilbourn; Truro cathedral; King's College Chapel, Cambridge) the result was a work of art from which, work- Paid as it may in a sense be, we may gather what such men might have done had they been left free to follow their own artistic impulse. It is necessary to refer to this because it is generally supposed that whatever is best in recent glass is due to the romantic movement. The charms of Burne-Jones's later work, the place the windows done by them among the triumphs of modern decorative art; but Morris was never foremost in the reaction, nor quite such a master of the material he was working in as he showed himself in less exacting crafts. Other artists to be mentioned in connexion with glass design are: Clement Heaton, Bayne, N. H. J. Westlake and Henry Holiday, not to speak of a younger generation of able men.

Foreign work shows, as compared with English, a less just appreciation of glass, though the foremost draughtsmen of their day were enrolled for its design. In Germany, King Louis of Bavaria employed P. von Cornelius and W. von Kaulbach (Aix-la-Chapelle, Cologne, Glasgow); in France the Bourbons employed J. A. D. Ingres, F. V. E. Delacroix, Vernet and J. H. Flandrin (Dreux); and the execution of their designs was entrusted to the most expert painters to be procured at Munich and Sèvres; but all to little effect. They either used potmetal glass of poor quality, or relied upon enamel — with the result that their colour lacks the qualities of glass. Where it is not heavy with paint it is thin and crude. In Belgium happier results were obtained. In the chapel of the Holy Sacrament at Brussels there is one window by J. B. Capronnier not unworthy of the fine series by B. van Orley which it supplements. At the best, however, foreign artists failed to appreciate the quality of glass; they put better draughtsmanship into their windows than English designers of the mid-Victorian era, and painted them better; but they missed the glory of translucent colour.

Modern facilities of manufacture make possible many things which were hitherto out of the question. Enamel colours are richer, their range is extended; and it may be possible, with the improved kilns and greater chemical knowledge we possess, to make them hold permanently fast. It was years ago demonstrated at Sèvres how a picture may be painted in colours upon a sheet of plate-glass measuring 4 ft. by 2 ft. We are now so doubt as a point to produce windows painted on much larger sheets. But the results achieved, technically wonderful as they are, hardly warrant the waste of time and labour upon work so costly, so fragile, so lacking in the qualities of a picture on the one hand and of glass on the other.

In America, John la Farge, finding European material not
dense enough, produced potmetal more heavily charged with colour. This was wilfully streaked, streaked and quasi-
accidentally varied; some of it was opalescent; much of it was
more like agate or onyx than jewels. Other forms of American
enterprise were: the making of glass in lumps, to be chipped
into flakes; the rucking it; the shaping it in a molten state, or the pulling it out of
shape. It takes an artist of some reserve to make judicious use of glass like this. Potters
and L. C. Tiffany have turned it to beautiful account; but even
they have put it to purposes more pictorial than it can properly fulfil. The design it
calls for is a severely abstract form of ornament verging upon the barbaric.

Of late years each country has been learning so much from
the others that the newest effort is very much in
one direction. It seems to be
agreed that the art of the window-maker begins with
glazing, that the all-needful thing is beautiful glass, that
painting may be reduced to a minimum, and on occasion (thanks to new developments
in the making of glass) dispensed with altogether. A
tendency has developed itself in the direction not merely of mosaic, but of carrying the
glazier's art farther than it has been done before and rendering
landscapes and even figure subjects in unpainted glass.
When, however, it comes to the representation of the human face, the limitations of
simple lead-glazing are at once apparent. A possible
way out of the difficulty was shown at the Paris Exhibition of 1900 by M. Tournel, who,
by fusing together coloured tesserae on to larger pieces of colourless glass, anticipated the
discovery of the already mentioned fragment of Byzantine
mosaic now in the Victoria and Albert Museum. He may have seen or heard of some-
thing of the sort. There would be no advantage in building up whole windows in this
way; but for the rendering of the flesh and sundry minute
details in a window for the most part heavily leaded, this
fusing together of tesserae, and even of little pieces of
glass cut carefully to shape, seems to supply the want of some-
thing more in keeping with severe mosaic glazing than painted
flats proves to be.

Glass painters are allowed to-day a freer hand than formerly.
They are no longer exclusively engaged upon ecclesiastical work;
domestic glass is an important industry; and a workman once
comparatively exempt from pedantic control is not so easily
restrained from self-expression. Moreover, the recognition of
the artistic position of craftsmen in general makes it possible
for a man to devote himself to glass without sinking to the rank
of a mechanic; and artists begin to realize the scope glass offers
them. What they lack as yet is experience in their craft, and

Examples of Important Historical Stained Glass.

There are remains of the earliest known glass: in France—at Le Mans, Chartres, Châlons-sur-Marne,
Angers and Poitiers cathedrals, the abbey church of St Denis and at St Remi. Reims: in England—at
York minster (fragments); in Germany—at Augsburg and Strassburg cathedrals: in Austria—in the
cloisters of Heiligen Kreuz.

The following is a classified list of some of the most characteristic and important windows, omitting
for the most part isolated examples, and giving by preference the names of churches where there is a fair
amount of glass remaining; the country in which at each period the art thrrove best is put first.

**Early Gothic**

**France.**
- Chartres
- Le Mans
- Bourges—cathedrals
- Reims
- Auxerre
- Ste Chapelle, Paris.
- Church of St Jean-aux-Bois.

**England.**
- York minster.
- Ely cathedral.
- Wells cathedral.
- Tewkesbury abbey.

**Italy.**
- Church of St Francis, Assisi.
- Church of Or San Michele, Florence.
- Church of S. Petronio, Bologna.

**Middle Gothic**

**France.**
- Church of St Sebalde, Nuremberg.
- Strasbourg—cathedrals.
- Augsburg—cathedrals.
- Erfurt.
- Freiburg.
- Church of Nieder Haslach.

**England.**
- York minster.
- Ely cathedral.
- Wells cathedral.
- Tewkesbury abbey.

**Italy.**
- Church of St Francis, Assisi.
- Church of Or San Michele, Florence.
- Church of S. Petronio, Bologna.

**Late Gothic**

**France.**
- Bourges—cathedrals.
- Troyes.
- Church of Notre Dame, Alençon.

**England.**
- New College, Oxford.
- Gloucester cathedral.
- York, minster and other churches.
- Great Malvern abbey.
- Church of St Mary, Shrewsbury.
- Fairfax church.

**Transition Period**

The choir of the cathedral at Auch.

**Renaissance**

**Netherlands.**
- Brussels cathedral.
- Church of St Jacques.
- Church of St Martin—Lübeck.

**Italy.**
- Arezzo—cathedrals.
- Milan—cathedrals.
- Certosa di Pavia.
- Church of S. Petronio, Bologna.
- Church of Sta Maria Novella, Florence.

**England.**
- York minster.
- Ely cathedral.
- Wells cathedral.
- Tewkesbury abbey.

**Late Renaissance**

**France.**
- Church of St Martin-b-Vignes, Troyes.
- Nave and transepts of Auch cathedral.

**Switzerland.**
- Most museums.

perhaps due workmanlike respect for traditional ways of work-
nmanship. When the old methods come to be superseded
it will be only by new ones evolved out of them. At present the
conditions of glass painting remain very much what they were.
The supreme beauty of glass is still in the purity, the brilliancy,
the translucency of its colour. To make the most of this the
designer must be master of his trade. The test of window design
GLASSBRENNER—GLASTONBURY

is, now as ever, that it should have nothing to lose and everything to gain by excavation in stained glass.

GLASSBRENNER, ADOLF (1810-1879), German humorist and satirist, was born at Berlin on 27th of March 1810. After being for a short time in a merchant’s office, he took to journalism, and in 1831 edited Das Gabel, a periodical which was suppressed in 1833 owing to its revolutionary tendencies. He next, under the pseudonym Adolf Brennglas, published a series of pictures of Berlin life, under the titles Berlin wie es ist und—trinkt (30 parts, with illustrations, 1833-1849), and Buntes Berlin (14 parts, with illustrations, Berlin, 1837-1838), and thus became the founder of a popular satirical literature associated with modern Berlin. In 1840 he married the actress Adele Peroni (1813-1893), and removed in the following year to Neustrelitz, where his wife had gained an engagement at the Grand ducal theatre. In 1848 Glassbrenner entered the political arena and became the leader of the democratic party in Mecklenburg-Schwerin. Expelled from that country in 1850, he settled in Hamburg, where he remained until 1853; and then he began editor of the Montagszeitung in Berlin, where he died on the 25th of September 1876.

Among Glassbrenner’s other humorous and satirical writings may be mentioned: Leben und Treiben der feinen Welt (1848; 1850); Träume aus Wien (2 vols., 1836); Gedichte (1851, 5th ed. 1870); the comic epics, Neuer Reinecke Fuchs (1849, 5th ed. 1879) and Die verkehrte Welt (1857, 6th ed. 1873); also Berliner Volkstuben (3 vols. illustrated, Leipzig, 1847-1851); Glassbrenner has published some charming books for children, notably Lachen Kinder (14th ed., 1884), and Sprechende Tiere (20th ed., Hamburg, 1899).

GLASS CLOTH, a textile material, the name of which indicates the use for which it was originally intended. The cloths are in general woven with the plain weave, and the fabric may be all white, striped or checked with red, blue or other coloured threads; the checked cloths are the most common. The real article should be all linen, but a large quantity is made with cotton warp and tow weft, and in some cases they are composed entirely of cotton. The short fibres of the cheaper kind are easily detached from the cloth, and hence they are not so satisfactory for the purpose for which they are intended.

GLASSIUS, SALOMO (1593-1656), theologian and biblical critic, was born at Sondershausen, in the principality of Schwarzwald-Sondershausen, on the 20th of May 1593. In 1612 he entered the university of Jena. In 1615, with the idea of studying law, he moved to Wittenberg. In consequence of an illness, however, he returned to Jena after a year. Here, as a student of theology under Johann Gerhard, he directed his attention especially to Hebrew and the cognate dialects; in 1619 he was made an "adjuutus" of the philosophical faculty, and some time afterwards he received an appointment to the chair of Hebrew. From 1625 to 1638 he was superintendent in Sondershausen; but shortly after the death of Gerhard (1637) he was, in accordance with Gerhard’s last wish, appointed to succeed him at Jena. In 1640, however, at the earnest invitation of Duke Ernest the Pious, he removed to Gotha as court preacher and general superintendent in the execution of important reforms which had been initiated in the ecclesiastical and educational establishments of the duchy. The delicate duties attached to this office he discharged with tact and energy; and in the "sybasestoy" controversy, by which Protestant Germany was so long vexed, he showed an unusual combination of firmness with liberality, of loyalty to the past with a just regard to the demands of the present and the future. He died on the 27th of July 1656.

His principal work, Philologia sacra (1623), marks the transition from the earlier views on questions of biblical criticism to those of the 17th century. This work contains a list of books, with a critical commentary on them, and the first critical edition of the Greek Testament. The last volume of his Opuscula was printed at Leiden in 1700. See the article in Herzog–Hauck, Realencyklopädie.

GLASSWORT, a name given to Salicornia herbacea (also known as marsh samphire), a salt-marsh herb with succulent, jointed, leafless stems, in reference to its former use in glass-making, when it was burnt for barilla. Salsolea kali, an allied plant with rigid, fleshy, spine-pointed leaves, which was used for the same purpose, is known as prickly glasswort. Both plants are members of the natural order Chenopodiaceae.

GLASTONBURY, a market town and municipal borough in the Eastern parliamentary division of Somersetshire, England, on the main road from London to Exeter, 37 m. S.W. of Bath by the Somerset & Dorset railway. Pop. (1901) 4016. The town lies in the midst of orchards and water-meadows, reclaimed from the fens which encircled Glastonbury Tor, a conical height once an island, but now, with the surrounding flats, a peninsula washed on three sides by the river Brue. The town is famous for its abbey, the ruins of which are fragmentary, and as the work of destruction has in many places descended to the very foundations it is impossible to make out the details of the plan. Of the vast range of buildings for the accommodation of the monks hardly any part remains except the abbot’s kitchen, noteworthy for its octagonal interior (the exterior plan being square, with the four corners filled in with fireplaces and chimneys), the porter’s lodge and the abbey barn. Considerable portions are standing of the so-called chapel of St Joseph at the west end, which has been identified with the Lady chapel, occupying the site of the earliest church. This chapel, which is the finest part of the ruins, is Transitional work of the 12th century. It measures about 66 ft. from east to west and about 36 from north to south. Below the chapel is a crypt of the 15th century inserted beneath a building which had no previous crypt. Between the chapel and the great church is an Early English building which appears to have served as a Galilee porch. The church itself was a cruciform structure with a choir, nave and transepts, and a tower surmounting the centre of intersection. From east to west the length was 40 ft. and the breadth of the nave was about 80 ft. The nave had ten bays and the choir six. Of the nave three bays of the south side are still standing, and the windows have pointed arches externally and semicircular arches internally. Two of the tower piers and a part of one arch give some indication of the grandeur of the building. The foundations of the Edgar chapel, discovered in 1908, make the whole church the longest of cathedral or monastic churches in the country. The old clock, presented to the abbey by Adam de Sodbury (1322-1335), and noteworthy as an early example of a clock striking the hours automatically with a count-wheel, was once in Wells cathedral, but is now preserved in the Victoria and Albert Museum.
The Glastonbury thorn, planted, according to the legend, by Joseph of Arimathea, has been the object of considerable comment. It is said to be a distinct variety, flowering twice a year. The actual thorn visited by the pilgrims was destroyed about the Reformation time, but specimens of the same variety are still extant in various parts of the country.

The chief buildings, apart from the abbey, are the church of St John Baptist, Perpendicular in style, with a fine tower and some 15th-century monuments; St Benedict’s, dating from 1403-1524; St John’s hospital, founded 1246; and the George Inn, built in the time of Henry VII. or VIII. The present stone cross replaced a far finer one of great age, which had fallen into disuse and had become a great growth for ivy. Among its relics is an excellent collection, including remains from a prehistoric village of the marshes, discovered in 1892, and consisting of sixty mounds within a space of five acres. There is a Roman Catholic missionaries’ college. In the 16th century the woolen industry was introduced by the duke of Somerset; and silk manufacture was carried on in the 18th century. Tanning and tile-making, and the manufacture of boots and sheep-skin rugs are practised. The town is governed by a mayor, 4 aldermen and 12 councillors. Area, 5000 acres.

The lake-village discovered in 1892 proves that there was a Celtic island 200-250 ft. on an island in the midst of swamps, and therefore easily defensible. British earthworks and Roman roads and relics prove later occupation. The name of Glastonbury, however, is of much later origin, being a corruption of the Saxon Glaesisynagyrig. By the Britons the spot seems to have been called Ynys yr Afalon (Latinized as Avalonia) or Ynysvitrin (see Avalon), and it became the local habitation of various fragments of Celtic romance. According to the legends which grew up under the care of the monks, the first church of Glastonbury was a little wattle building erected by Joseph of Arimathea as the leader of the twelve apostles sent over to Britain from Gaul by St Philip. About a hundred years later, according to the same authorities, the two missionaries, Phaganus and Deruviavus, who came to King Lucius from Pope Eleutherius, established a fraternity of anchorites on the spot, and after three hundred years more St Patrick introduced among them a regular monastic life. The British monastery founded about 605 was succeeded by a Saxon abbey built by Ine in 708. From the decadent state into which Glastonbury was brought by the Danish invasions it was recovered by Dunstan, who had been educated within its walls and was appointed its abbot about 946. The church and other buildings of his erection remained till the installation, in 1082, of the first Norman abbot, who inaugurated the new epoch by commencing a new church. His successor Herlewin (1101-1120), however, pulled it down to make way for a finer structure. Henry of Blois (1126-1172) added greatly to the extent of the monastery. In 1184 (on 25th May) the whole of the buildings were laid in ruins by fire; but Henry II. of England, in whose hands the monastery then was, entrusted his chamberlain Rudolphus with the work of restoration, and caused it to be carried out with much magnificence. The great church of which the ruins still remain was then erected. In the end of the 13th century, and on into the following, Glastonbury was distracted by a strange dispute, caused by the attempt of Savaric, the ambitious bishop of Bath, to make himself master of the abbey. The conflict was closed by the decision of Innocent III., that the abbacy should be merged in the new see of Bath and Glastonbury, and that Savaric should have a fourth of the property. On Savaric’s death his successor gave up the joint bishopric and allowed the monks to elect their own abbot. From this date to the Reformation the monastery, one of the chief Benedictine abbeys in England, continued to flourish, the chief events in its history being connected with the maintenance of its claims to the possession of the bodies or tombs of King Arthur and St Dunstan. From early times through the middle ages it was a place of pilgrimage. As early as at least as the beginning of the 11th century the tradition that Arthur was buried at Glastonbury appears to have taken shape; and in the reign of Henry II., according to Giraldus Cambrensis and others, the abbey Henry de Blois, causing search to be made, discovered at the depth of 16 ft. a massive oak trunk with an inscription “Hic jacet sepultus incolitus rex Arthurus in insula Avalonia.” After the fire of 1184 the monks asserted that they were in possession of the remains of St Dunstan, which had been abstracted from Canterbury after the Danish sack of 1011 and kept in concealment ever since. The Canterbury monks naturally denied the assertion, and the contest continued for centuries. In 1508 Warham and Goldstyn having examined the Canterbury shrine reported that it contained all the principal bones of the saint, but the abbot of Glastonbury in reply as stoutly maintained that this was impossible. The day of such disputes was, however, drawing to a close. In 1559 the last of the abbots of Glastonbury, Robert Wythtman, was lodged in the Tower on account of “divers and sundry reasons.” “The ‘account’ or ‘book’ of his treasons . . . . seems to be lost, and the nature of the charges . . . . can only be a matter of speculation” (Gairdner, Cat. Pop. on Hen. VIII., xiv. ii. pref. xxxii.). He was removed to Wells, where he was “arraigned and next day put to execution for robbing of Glastonbury church.” The execution took place on Glastonbury Tor. His body was quartered and his head fixed on the abbey gate. A darker passage does not occur in the annals of the English Reformation and its murder was never avenged. Worse than any other was his suspicion that he defended as best he could from the hand of the spoiler the property in his charge.

In 1907, the site of the abbey with the remains of the buildings, which had been in private hands since the granting of the estate to Sir Peter Carew by Elizabeth in 1559, was bought by Mr Ernest Jardine for the purpose of transferring it to the Church of England. Bishop Kennon of Bath and Wells entered into an agreement to raise a sum of £1,000, the cost of the purchase; this was completed, and the site and buildings were formally transferred at a dedicatory service in 1909 to the Diocesan Trustees of Bath and Wells, who are to hold and manage the property according to a deed of trust. This deed provided for the appointment of an advisory council, consisting of the archbishop of Canterbury, the bishop of Bath and Wells and four other bishops, each with power to nominate one clerical and one lay member. The council has the duty of deciding the purpose for which the property is to be used “in connexion with and for the benefit of the Church of England.” To give time for further collection of funds and deliberation, the property was re-let for five years to the original purchaser.

In the 8th century Glastonbury was already a borough owned by the abbey, which continued to be overlord till the Dissolution. The abbey obtained charters in the 7th century, but the town received its first charter from Henry II., who exempted the men of Glastonbury from the jurisdiction of royal officials and freed them from certain tolls. This was confirmed by Henry III. in 1227, by Edward I. in 1278, by Edward II. in 1313 and by Henry VI. in 1447. The borough was incorporated by Anne in 1706, and the corporation was reformed by the act of 1835. In 1319 Glastonbury received a writ of summons to parliament, but made no return, and has not since been represented. A fair on the 8th of September was granted in 1127; another on the 29th of May was held under a charter of 1282. Fairs known as Tott’s fair and Mayfair are now held on the second Mondays in September and October and are chiefly important for the sale of horses and cattle. The market day every other Monday is noted for the sale of cheese. Glastonbury owed its medieval importance to its connexion with the abbey. At the Dissolution the introduction of woollen manufacture checked the decay of the town. The cloth trade flourished for a century and was replaced by silk-weaving, stocking-knitting and glove-making, all of which have died out.

See Abbots Gasquet, Henry VIII. and the English Monasteries (1906), and The Last Abbots of Glastonbury (1895 and 1908); William of Malmesbury, “De abbatibus,” in Chronicon, ed. by Hearne (Cambridge, 1843), iii. 168 (“Scriptores rerum anglicarum scripti,” vol. i. 168) (also printed by Hearne and Migne): John of Glastonbury, Chronica sive de hist. de rebus Glast., ed. by Hearne (2 vols., Oxford, 1726); Adam of Domerham, De rebus Glast., ed. by Hearne (1839); Oxford, Glastonbury, and Bath (London, 1807); Avalonian Guide to the Town of Glastonbury (8th ed., 1839); Warner, Hist. of the Abbey and Town (Bath, 1825); Rev. GLATIGNY—GLAUCAU

GLATIGNY, JOSEPH ALBERT ALEXANDRE (1839—1873), French poet, was born at Lillebonne (Seine Inférieure) on the 21st of May 1839. His father, who was a carpenter and afterwards a gendarme, removed in 1844 to Bernay, where Albert received an elementary education. Soon after leaving school he was apprenticed to a printer at Pont Audemer, where he produced a three-act play at the local theatre. He then joined a travelling company of actors to whom he acted as prompter. In 1862, he returned to Paris, and the following year, primarily by the study of Théodore de Banville, he published his Vignes folles in 1857; his best collection of lyrics, Les Flèches d'or, appeared in 1864; and a third volume, Gîles et pasquins, in 1872. After Glatigny settled in Paris he improvised at café concerts and wrote several one-act plays. On an expedition to Corsica with a travelling company he was on one occasion arrested and put in irons for a week through being mistaken by the police for a notorious criminal. His marriage with Emma Demnie brought him great happiness, but the hardships of his life weakened his health and he died at Sèvres on the 16th of April 1873.

See Catulle Mendès, Légende du Parnasse contemporain (1884), and Glatigny, drame jambesbucheuse (1906).

GLATZ (Slav. Kladsko), a fortified town of Germany, in the Prussian province of Silesia, in a narrow valley on the left bank of the Neisse, not far from the Austrian frontier, 58 m. S.W. from Breslau by rail. Pop. (1905) 16,053. The town with its narrow streets winds up the fortified hill which is crowned by the old citadel. Across the river, on the Schäferberg, lies a more modern fortress built by the Prussians about 1750. Before the town on both banks of the river there is a fortified camp by which bombardment from the neighbouring heights can be hindered and which affords accommodation for 10,000 men. The inner centurie of walls was razed in 1807 and their site is now occupied by new streets. The Roman Catholic Cathedral and St. Lukas, one of which, the parish church, contains the monuments of seven Silesian dukes. Among the other buildings the principal are the Royal Catholic gymnasiurn and the military hospital. The industries include machine shops, breweries, and the manufacture of spirits, linen, damask, cloth, hosiery, beads and leather.

Glatz existed as early as the 10th century, and received German settlers about 1250. It was besieged several times during the Thirty Years' War and during the Seven Years' War and came into the possession of Prussia in 1742. In 1813 and 1814 and 1866 great devastation was caused here by floods. The county of Glatz was long contended for by the kingdoms of Poland and of Bohemia. Eventually it became part of the latter country, and in 1534 was sold to the house of Habsburg, from whom it was taken by Frederick the Great during his attack on Silesia. See Ludwik, Die Grafschaft Glatz in Wort und Bild (Breslau, 1897); Kutzen, Die Grafschaft Glatz (Glogau, 1873); and Geschichte Schlesier der Grafschaft Glatz, edited by F. Vollmer and Hohaus (1883—1891).

GLAUBER, JOHANN RUDOLF (1604—1668), German chemist, was born at Karlstadt, Bavaria, in 1604 and died at Amsterdam in 1668. Little more is known of his life than that he resided successively in Vienna, Salzburg, Frankfurt and Cologne before settling in Holland, where he made his living chiefly by the sale of secret chemical and medicinal preparations. He wrote, besides several small pieces on chemical and other devices of the alchemists, he made some real contributions to chemical knowledge. Thus he clearly described the preparation of hydrochloric acid by the action of oil of vitriol on common salt, the manifold virtues of sodium sulphate—sal mirabilis. Glauber's salt—formed in the process being one of the chief themes of his Miraculum mundi; and he noticed that nitric acid was formed when nitre was substituted for the common salt. Further he prepared a large number of substances, including the chlorides and other salts of lead, tin, iron, zinc, copper, antimony and arsenic, and he even noted some of the phenomena of double decomposition. He was always anxious to turn his knowledge to practical account, whether in preparing medicines, or in furthering industrial arts such as dyeing, tanning or mineral processing. The fertility of the soil by artificial manuring was of great importance. One of his most notable works was his Teutschlands Wohlthart in which he urged that the natural resources of Germany should be developed for the profit of the country and gave various instances of how this might be done. His treatises, about 30 in number, were collected and published at Frankfort in 1658—1659, at Amsterdam in 1661, and, in an English translation by Fucker, at London in 1689.

GLAUBER'S SALT, decahydrated sodium sulphate, Na₂SO₄·10H₂O. It is said by J. Kunkel to have been known as an aconarium or secret medicine to the electoral house of Saxony in the middle of the 16th century, but it was first described by J. R. Glauber (De natura solv. 1658), who prepared it by the action of oil of vitriol or sulphuric acid on common salt, and, ascribing to it many medicinal virtues, termed it sal mirabilis Glauberi. As the mineral therandite or mirabilite, which crystallizes in the rhombic system, it occurs in many parts of the world, as in Spain, the western states of North America and the Russian Caucasus; in the last-named region, about 25 m. E. of Tiflis, there is a thick bed of the pure salt about 5 ft. below the surface, and at Belalpashinsk there are lakes and ponds in the waters of which are an almost pure solution. The substance is the active principle of many mineral waters, e.g. Fredericks- holl; it occurs in sea-water and it is a constant constituent of the blood. In combination with calcium sulphate, it constitutes the mineral graherite or bronngnartite, Na₂SO₄-CaSO₄, which assumes forms belonging to the monoclinic system and occurs in Spain and Austria. It has a bitter, saline, but not acrid taste. At ordinary temperatures it crystallizes from aqueous solutions in large colourless monoclinic prisms, which effloresce in dry air, and at 15° C. melt in their water of crystalization. At 190° they lose all their water, and on further heating fuse at 843°. Its maximum solubility in water is at 34°; above that temperature it ceases to exist in the solution as a decahydrate, but changes to the anhydrous salt, the solubility of which decreases with rise of temperature. Glauber's salt readily forms supersaturated solutions, in which crystallization takes place suddenly when a crystal of the salt is thrown in; the same effect is obtained by exposure to the air or by touching the solution with a glass rod. In medicine it is employed as an aperient, and is one of the safest and most innocuous known. For children it may be mixed with common salt and the two be used with the food without the child being conscious of any difference. Its simulation of the taste of common salt also renders it suitable for administration to insane patients and others who refuse to take any drug. If, however, its presence is recognized sodium phosphate may be substituted.

GLAUCAU, a town of Germany, in the kingdom of Saxony, on the right bank of the Mulde, 7 m. N. of Zwickau and 17 W. of Chemnitz by rail. Pop. (1875) 21,743; (1905) 24,556. It has important manufactures of woollen and half-woollen goods, in regard to which it occupies a high position in Germany. There are also dye-works, print-works, and manufactories of paper, linen, thread and machinery. Glauchau possesses a high grade school, elementary schools, a weaving school, an orphanage and an infirmary. Some portions of the extensive old castle date from the 12th century, and the Gottesacker church contains interesting antiquarian reliques. Glauchau was founded by a colony of Sorbs and Wendis, and belonged to the lords of Schönaug as early as the 12th century.

See R. Hofmann, Rücksicht über die Geschichte der Stadt Glauchau (1897).
GLAUCONITE—GLAUCUS

GLAUCONITE, a mineral, green in colour, and chemically a hydrous silicate of iron and potassium. It especially occurs in the green sands and muds which are gathering at the present time on the sea bottom at many different places. The wide extension of these sands and muds was first made known by the naturalists of the "Challenger," and it is now found that they occur in the Mediterranean as well as in the open ocean, but they have not been observed in the Pacific sea or in any fresh-water lakes of three different colours. These deposits are not in a true sense abyssal, but are of terrigenous origin, the mud and sand being derived from the wear of the continents, transported by marine currents. The greater part of the mass consists in all cases of minerals such as quartz, felspar (often labradorite), mica, chlorite, with or less calcite which is probably always derived from shells or other organic sources. Many accessory minerals such as tourmaline and zircon have been identified also, while augite, hornblende and other volcanic minerals occur in varying proportion as in all the sediments of the open sea. The depth in which they accumulate varies a good deal, viz. from 200 up to 2000 fathoms, but as a rule is less than 1000 fathoms, and it is believed that the most common situations are where the continental shores slope rather steeply into moderate depths of water. Many of the blue muds, which owe their colour to fine particles of sulphide of iron, contain also a small quantity of glauconite; in Globigerina oozes this substance has also been found, and in fact there exists every gradation between the glauconitic deposits and the other types of sands and muds which are commonly known by the same name.

The colouring matter is believed in every case to be glauconite. Other ingredients, such as lime, alumina and magnesia are usually shown to be present by the analyses, but may perhaps be regarded as non-essential: it is impossible to isolate this substance in a pure state as it occurs only in fine aggregates, mixed with other minerals. The glauconite, though crystalline, never occurs well crystallized but only as dense clusters of very minute particles which react feebly on polarized light. They have one well-marked characteristic lamina which they often form round rounded lumps. In many cases it is certain that these are cemented to fill up the interior of empty shells of Foraminifera. They may be seen occupying these shells, and when the shell is dissolved away perfect casts of glauconite are set free. Apparently in some manner not understood, the decaying organic matter in the shell of the dead organism initiated or favoured the chemical reactions by which the glauconite was formed. That the mineral originated on the sea bottom among the sand and mud is quite certainly established by these facts; moreover, since it is so soft and friable that it is easily powdered up by pressure with the finger, it cannot have been transported from any great distance by currents. Small rounded glauconite lumps, which are common on the sands but show no trace of having filled the chambers of Foraminifera, may have arisen by a re-deposit of broken-down casts such as have been described; probably slight movement of the deposits, occasioned by currents, may have broken up the glauconite casts and scattered the soft material through the water. Films or stains of glauconite on shells, sand grains and phosphate nodules are explained by a similar deposit of fragmental glauconite.

In a small number of Tertiary and older rocks glauconite occurs as an essential component. It is found in the Eocene sands of Holland, the Eocene sands of Paris and the "Molasse" of Switzerland, but is much more abundant in the Lower Cretaceous rocks of N. Europe, especially in the subdivision known as the Greensand. Rounded lumps and casts like those of the green sands of the present day are plentiful in these rocks, and it is obvious that the mode of formation was in all respects the same. The green sand when weathered is brown or rusty coloured, and it is easily powdered up by pressure with the fingers, and may impure limestones with glauconite are also by no means rare, an example being the well-known Kentish Rag. In the chalk- and chalk-marl of some parts of England glauconite is rather frequent, and glauconitic chalk is known also in the north of France. Among the oldest rocks which contain this mineral are the Lower Silurian of the St Petersburs district, but it is very rare in the Palaeozoic formations, possibly because it undergoes crystalline change and is also liable to be oxidized and converted into other ferruginous minerals. It has been suggested that certain deposits of iron ores may owe their origin to deposits of glauconite, as for example those of the Mesabi range, Minnesota, U.S.A.

GLAUCUS (Gr. γιγαντός, bright, gleaming), a word meaning of a sea-green colour, in botany covered with bloom, like a plum or a cabbage-leaves.

GLAUCUS ("bright"), the name of several figures in Greek mythology, the most important of which are the following:

1. GLAUCUS, surnamed Pontius, a sea divinity. Originally a fisherman and diver of Antheodon in Boeotia, having eaten of a certain magical herb sown by Cronus, he leapt into the sea, where he was changed into a god, and endowed with the gift of unerring prophecy. According to others he sprang into the sea for love of the sea-god Melicertes, with whom he was often identified (Athenaeus vii. 296). He was worshipped not only at Antheodon, but on the coasts of Greece, Sicily and Spain, where fishermen and sailors at certain seasons watched for his arrival during the night in order to consult him (Pausanias ix. 22). In art he is depicted as a vigorous old man with long hair and beard, his body terminating in a scaly tail, his breast covered with shells and seaweed. He was said to have been the builder and pilot of the Argo, and to have been changed into a god after the fight between the Argonauts and Tyrrhenians. He assisted the expedition in various ways (Athenaeus ix. 909). The town of Glaucus was probably the subject of a satyrical drama by Aeschylus. He was famous for his amours, especially those with Scylla and Circe.

See the exhaustive monograph by R. Gaegechens, Glaucus der Meergott (1860), and article by the same in Roscher's Lexicon der Mythologie, and for Glaucus and Scylla, E. Vinet in Annali del' Instituto di Corrispondenza archeologica, xv (1843).

2. GLAUCUS, usually surnamed Potnies, from Potnies near Thebes, son of Sisyphus by Merope and father of Bellerophon. According to the legend he was born to pieces by his own mares (Virgil, Georg, ii. 616; Hyginus, Fab. 250, 273). On the liesmus of Corinth, and also at Olympia and Nemaus, he was worshipped as Taraxippus ("terrifier of horses"), his ghost being said to appear and frighten the horses at the games (Pausanias vi. 20). He is closely akin to Glaucus Pontius, the frantic horses of the one probably representing the stormy waves, the other the sea in its calmer mood. He also was the subject of a lost drama of Aeschylus.

3. GLAUCUS, the son of Minos and Pasiphaë. When a child, while playing at ball or pursuing a mouse, he fell into a jar of honey and was smothered. His father, after a vain search for him, consulted the oracle, and was referred to the person who should suggest the aptest comparison for one of the cows of Minos which had the power of assuming three different colours. Polyidus of Argos, who had likened it to a mulberry (or bramble), which changes from white to red and then to black, soon afterwards discovered the child; but on his confessing his inability to restore him to life, he was shut up in a vault with the corpse. Here he killed a serpent which was revived by a companion, which laid a certain herb upon it. With the same herb Polyidus brought the dead Glaucus back to life. According to others, he owed his recovery to Aesculapius. The story was the subject of plays by the three great Greek tragedians, and was often represented in mimic plays.

See Hyginus, Fab. 135; Apollodorus iii. 3. 10; C. Hock, Kretä, iii. 1829; C. Eckermann, Melampus, 1840.

4. GLAUCUS, son of Hippolochus, and grandson of Bellerophon, mythical progenitor of the kings of Ionia. He was a Lycian prince who, along with his cousin Sarpedon, assisted Priam in the Trojan War. When he found himself opposed to Diomedes, with whom he was connected by ties of hospitality, they ceased fighting and exchanged armour. Since the equipment of Glaucus was golden and that of Diomedes brazen, the expression "golden for brazen" (Iliad, vi. 236) came to be used proverbially for a bad exchange. Glaucus was afterwards slain by Ajax.

All the above are exhaustively treated by R. Gaegechens in Ersch and Gruber's Allgemeine Enzyklopädie.
GLAZING—The business of the glazier may be confined to the mere fitting and setting of glass (*q.v.*), even the cutting up of the plates into squares being generally an independent art, requiring a degree of tact and judgment not necessarily possessed by the building artificer. The tools generally used by the glazier are the diamond for cutting, laths or straight edges, tee square, measuring rule, glazing knife, hacking knife and hammer, duster, sash tool, two-foot rule and a glazier’s cradle for carrying the glass. Glaziers’ materials are glass, putty, priming or paint, springs, wash-leather or india-rubber for door panels, size, black. The glass is supplied by the manufacturer and cut to the sizes required for the particular work to be executed. Putty is made of whiting and linseed oil, and is generally bought in iron kegs of ½ or 1 cwt.; the putty should always be kept covered, and when found to be getting hard in the keg a little oil should be put on it to keep it moist. Priming is a thin coat of paint with a small amount of red lead in it. In the majority of cases after the bases for the windows are fitted they are sent to the glazier’s and primed and glazed, and then returned to the job and hung in their proper positions. When priming sashes it is important that the rebates be thoroughly primed else the putty will not adhere. All wood that is to be painted requires before being primed to have the knots coated with knotting. When the priming is dry, the glass is cut and fitted into its place; each pane should fit easily with about ⅛th in. play all round. The glazier runs the putty round the rebates with his hands, and then beds the glass in it, pushing it down tight, and then further secures it by knocking in small nails, called glaziers’ sprigs, on the rebate side. He then trims up the edges of the protruding putty and bevels off the putty on the rebate or outside of the sash with a putty knife. The sash is then ready for painting. Large squares and plate glass are usually inserted when the sashes are hung to avoid risks of breakage. For inside work the panes of glass are generally secured with beads (not with putty), and in the best work these beads are fixed with brass screws and caps to allow of easy removal without breaking the beads and damaging the paint, &c. In the case of glass in door panels where there is much vibration and slamming, the glass is bedded in wash-leather or india-rubber and secured with beads as before mentioned.

The most common glass and that generally used is clear sheet in varying thicknesses, ranging in weight from 15 to 30 oz. per sq. ft. This can be had in several qualities of English or foreign manufacture. But there are many other varieties—obscured, fluted, enamelled, coloured and ornamental, rolled and rough plate, British polished plate, patent plate, fluted rolled, quarry rolled, chequered rough, and a variety of figured rolled, and stained glass, and crown-glass with designs in the centre.

Lead light glazing is the glazing of frames with small squares of glass, which are held together by reticulations of lead; these are secured by means of copper wire to iron saddle bars, which are let into mortices in the wood frames or stone jambs. This is formed with strips of lead, soldered at the angles; the glass is placed between the strips and the lead flattened over the edges of glass to secure it. This is much used in public buildings and private residences. In Weldon’s method the saddle bars are bedded in the centre of the strips of lead, thus strengthening the frame of lead strips and giving a better appearance.

*Fig. 1.*—Prism covered with a capping of copper or zinc secured Window Glass. with bolts and nuts. Another employs steel bars covered with lead; and this is a very good method, as the bars are of small section, require no painting, and are also fire-resisting. There is one reason for preferring wood to steel, namely, that wood does not expand and contract like steel does. After the sun has been on steel bars, especially those in long lengths, they tend to buckle and then when cold contract, thus getting out of shape; there is also the possibility that when expanding they may break the glass. This is more noticeable in the case of iron ventilating frames in this glazing, which after having weathered for a year or two will begin to get out of shape and so give trouble in opening and closing the shutters. Care should be taken not to fit the glass in iron bars tightly, but a good ⅛ in. play all round should be allowed. A few of the systems of patent roof glazing will be described in the following pages, together with illustrations.

The system of glazing known as the “British Challenge” (*fig. 3*), with steel bars enclosed with a sheeting of galvanized iron, is very simple and durable, needs no painting, and can be fixed at as much as 8 ft. clear bearings, with the bars spaced 2 ft. apart. The ends of the bars rest on the wood or steel purins or plates, and are either notched and screwed down, or simply fitted with a bracket which is screwed. The bar is of T section with condensation grooves, and the lead wings on top are turned down on to the glass after fitting. This lead-covered steel bar is a great improvement on the plain steel bar as it is entirely unaffected by smoke, acids or exhaust fumes from steam engines; this is important in the case of a railway station, where the fumes would otherwise drive away an armed guard. The bars are hinged in a similar manner to the last, the top wings being double and the underside of the bar having an additional wing to catch the condensation. The Heywood combination system (*fig. 5*) is composed of galvanized steel T-bars, sometimes encased in lead and sometimes partly encased. It has a capping and condensation gutter of lead, portions of the apartment. It can be fixed in the ordinary way or placed over the existing glass.

Pavement lights (*fig. 2*) and stallboard lights are constructed with iron frames in small squares and glazed with thick prismatic glass, and are used to light basements. They are placed on the pavement and under shop fronts in the portion called the stallboard, and are also inserted in iron coal plates.

Great skill has of late years been displayed in the ornamentation of glass upon such panels as windows in public saloons, restaurants, &c., as, for instance, in bevelling the edges, silvering, brilliant cutting, embossing, bending, cutting shelving to fancy shapes and polishing, and in glass ventilators.

There are several patent methods of roof glazing, such as are applied to railway stations, studios and printing and other factories requiring light. Some of the first patents of this kind were erected with wood glazing bars; these were unsightly, since they required to be of large sectional area when spanning a distance of 7 or 8 ft., and also required to be constantly painted. This was a source of trouble; the roof was constantly leaking and, moreover, it was not fire-resisting.

Of subsequent patents one includes the use of steel T-bars, in which the glass is bedded and covered with a capping of copper or zinc secured with bolts and nuts. Another employs steel bars covered with lead; and this is a very good method, as the bars are of small section, require no painting, and are also fire-resisting. There is one reason for preferring wood to steel, namely, that wood does not expand and contract like steel does. After the sun has been on steel bars, especially those in long lengths, they tend to buckle and then when cold contract, thus getting out of shape; there is also the possibility that when expanding they may break the glass. This is more noticeable in the case of iron ventilating frames in this glazing, which after having weathered for a year or two will begin to get out of shape and so give trouble in opening and closing the shutters. Care should be taken not to fit the glass in iron bars tightly, but a good ⅛ in. play all round should be allowed. A few of the systems of patent roof glazing will be described in the following pages, together with illustrations.

The system of glazing known as the “British Challenge” (*fig. 3*), with steel bars enclosed with a sheeting of galvanized iron, is very simple and durable, needs no painting, and can be fixed at as much as 8 ft. clear bearings, with the bars spaced 2 ft. apart. The ends of the bars rest on the wood or steel purins or plates, and are either notched and screwed down, or simply fitted with a bracket which is screwed. The bar is of T section with condensation grooves, and the lead wings on top are turned down on to the glass after fitting. This lead-covered steel bar is a great improvement on the plain steel bar as it is entirely unaffected by smoke, acids or exhaust fumes from steam engines; this is important in the case of a railway station, where the fumes would otherwise drive away an armed guard. The bars are hinged in a similar manner to the last, the top wings being double and the underside of the bar having an additional wing to catch the condensation. The Heywood combination system (*fig. 5*) is composed of galvanized steel T-bars, sometimes encased in lead and sometimes partly encased. It has a capping and condensation gutter of lead.
and the glass is bedded on asbestos packing to get a better bearing edge, so as to be held more securely. Hope's glazing is very similar, but the bars are either T or cross according to the span. The "Perfection" glazing used by Messrs. Hellwell & Co. (fig. 6) is composed of steel shaped T bars with copper capping, secured with bolts and nuts and having asbestos packing on top of the glass under the edges of the capping. Peppercock's glazing is composed of steel shaped T bars encased with lead and lead wings. Rendle's "Invincible" glazing (fig. 7) is composed of steel T bars with specially shaped copper water and condensation channels, all formed in the one piece and resting on top of the T steel; the glass is held in the zinc channel, and copper capping is fixed over the edges of the glass and secured with bolts and nuts. Deard's glazing is very similar, and is most at the time encased with lead; it claims to save all drililing for fixing to iron roofs. There are also other systems composed of wood bars with condensation gutter and capping of copper secured with bolts and nuts, and asbestos packing with slight differences in some minor matters, but these systems are but little tried.

Cloisonné glass is a patent ornamental glass formed by placing two pieces flat almost each of different species enclosing glass mosaic. Designs are worked and shaped in gilt wire and placed on one sheet of glass; the space between the wire is filled by the coloured glass. A second sheet of glass is placed on top of the first and held in position, and the edges of the glass are bound with linen, &c., to keep them firmly together. Glass is now used for decorative purposes, such as wall tiling and ceilings; it is coloured and decorated in almost any shade and presents a very effective appearance. An invention has been patented for building houses entirely of glass; the walls are constructed of blocks or bricks of opaque glass, the several walls being varied in thickness according to the architectural requirements.

It is certainly true that daylight has much to do with the sanitary condition of all buildings, and this being so the proper distribution of daylight to a building is of the greatest possible importance, and must be effected by an ample provision of windows judiciously arranged. The heads of all windows should be kept as near the ceiling as possible, as well to obtain easy ventilation as to ensure good lighting. As far as is practicable a building should be planned so that each room receives the sun's rays for some part of the day. This is rarely an easy matter, especially in districts where the aspect of the buildings is out of the architect's hands. The best sites for light are found in streets running north and south and east and west, and lighting areas or courts in buildings should always if possible be arranged on these lines. The task of adequately lighting lofty city buildings has been greatly minimized by the introduction of many forms of reflecting and intensifying contrivances, which are used to deflect light into those apartments into which daylight does not directly penetrate, and which would otherwise require the use of artificial light to render them of any use; the most useful of these inventions is the various kinds of prism glass already referred to and illustrated in this article.

See L. F. Day, Stained and Painted Glass; and W. Eckstein, Interior Lighting. (J. Br.)

**GLAZUNOV—GLEE**

Russian musical composer, was born in St Petersburg on the rooth of August 1865, his father being a publisher and bookseller. He showed an early talent for music, and studied for a year or so with Rimsky-Korsakov. At the age of sixteen he composed a symphony (afterwards elaborated and published as op. 3), but his opus 1 was his first work in D, followed by a pianoforte suite on S-a-c-h-a, the diminutive of his name Alexander. In 1884 he was taken up by Liszt, and soon became known as a composer. His first symphony was played that year at Weimar, and he appeared as a conductor at the Paris exhibition in 1889. In 1897 his fourth and fifth symphonies were performed in London under his own conducting. In 1900 he became professor at the St Petersburg conservatoire. His separate works, including orchestral symphonies, dance music and songs, make a long list. Glazunov is a leading representative of the modern Russian school, and a master of orchestration; his tendency as compared with contemporary Russian composers is towards classical form, and he was much influenced by Brahms, though in "programme music" he is represented by such works as The Forester, Stekla Rasin, The Kremlin and his suite Aus dem Mittelalter. His ballet music, as in Raymonda, achieved much popularity.

**GLEBE** (Lat. glæba, glæba, clod or lump of earth, hence soil, land), in ecclesiastical law the land devoted to the maintenance of the incumbent of a church. Burn (Ecclesiastical Law, s.v. "Glebe Lands") says: "Every church of common right is entitled to house and glebe, and the assigning of them at the first was of such absolute necessity that without them no church could be regularly consecrated. The house and glebe are both comprehended under the word manse, of which the rule of the canon law is, sanctum est ut unicuique ecclesiae unus manus integer absqueullo servito tributar." In the technical language of English law the fee-simple of the glebe is said to be in abeyance, that is, it exists "only in the remembrance, expectation and intention of the law." But the freehold is in the parson, although at common law he could alienate the same only with proper consent,—that is, in his case, with the consent of the bishop. The disabling statutes of Elizabeth (Alienation by Bishops, 1559, and Bishop, 1570) made void all alienations by ecclesiastical persons, except leases for the term of twenty-one years or three lives. By an act of 1842 (5 & 6 Vict. c. 27, Ecclesiastical Leases) glebe land and buildings may be let on lease for farming purposes for fourteen years or on an improving lease for twenty years. But the parsonage house and ten acres of glebe situate most conveniently for occupation must not be leased. By the Ecclesiastical Leasing Acts of 1842 (5 & 6 Vict. c. 108) and 1858 glebe lands may be let on building leases for not more than ninety-nine years and on mining leases for not more than sixty years. The Tithe Act 1842, the Glebe Lands Act 1888 and various other acts make provision for the sale, purchase, exchange and gift of glebe lands. In Scots ecclesiastical law, the manse now signifies the minister's dwelling-house, the glebe being the land to which he is entitled in addition to his stipend. All parish ministers appear to be entitled to a glebe, except the ministers in royal burghs proper, who cannot claim a glebe unless there be a landowner's district annexed; and even in that case, when there are two ministers, it is only the first who has a claim. See F. S. Phillimore, Ecclesiastical Law (2nd ed.); Cripps, Law of Church and Clergy, 3 vols. (6th ed.); Dart, Vendors and Purchasers (7th ed.).

**GLEE,** a musical term for a part-song of a particular kind. The word, as well as the thing, is essentially confined to England. The technical meaning has been explained in different ways; but there is little doubt of its derivation through the ordinary sense of the word (i.e. merriment, entertainment) from the A.S. gleo, gleo, corresponding to Lat. gaudium, delectamentum, hence ludus musicus; on the other hand, a musical "glee" is by no means necessarily a merry composition. Gleeman (A.S. "gleo- man ") is translated simply as "musicus" or "cantor," to which the less distinguished titles of "minus, jocista, scura," are frequently added in old dictionaries. The accomplishments and social position of the gleeman seem to have been as varied as those of the Provençal "joglar." There are early examples of the word "glee" being used as synonymous with harmony or concerted music. The former explanation, for instance, is given in the Prompторium Parlamentorum, a work of the 15th century. Glee in its present meaning signifies, broadly speaking, a piece of concerted vocal music, generally unaccompanied, and for male voices, though exceptions are found to the last two restrictions. The number of voices ought not to be less than three. As regards musical form, the glee is little distinguished from the catch,—the two terms being often used indiscriminately for the
same song; but there is a distinct difference between it and the madrigal—one of the earliest forms of concerted music known in England. While the madrigal does not show a distinction of contrasted movements, this feature is absolutely necessary in the glee. In the madrigal the movement of the voices is strictly contrapuntal, while the more modern form allows of freer treatment and more compact harmonies. Differences of tonality are fully explained by the development of the art, for while the madrigal reached its acme in Queen Elizabeth's time, the glee proper was little known before the Commonwealth; and its most famous representatives belong to the 18th century and the first quarter of the 19th. Among the numerous collections of the innumerable pieces of this kind, only one of the earliest and most famous may be mentioned, Catch that Catch can, a Choice Collection of Catches, Rounds and Canons, for three and four voices, published by John Hilton in 1652. The name "glee," however, appears for the first time in John Flaylord's Musical Companion, published twenty-one years afterwards, and reprinted again and again, with additions by later composers—Henry Purcell, William Croft and John Blow among the number. The originator of the glee in its modern form was Dr Arne, born in 1710. Among later English musicians famous for their glees, catches and part-songs, the following may be mentioned:—Attwood, Boyce, Bishop, Crotch, Callcott, Shield, Stevens, Horsley, Webb and Knyvett. The convivial character of the glee led, in the 18th century, to the formation of various societies, which offered prizes and medals for the best compositions of the kind and assembled for social and artistic purposes. The most famous amongst these—The Glee Club—was founded in 1787, and at first used to meet at the house of Mr Robert Smith, in St. Paul's churchyard. This club was dissolved in 1857. A similar society—the Catch Club—was formed in 1761 and is still in existence.

Gleichen, two groups of castles in Germany, thus named from their resemblance to each other (Ger. gleich = like, or resembling). The first is a group of three, each situated on a hill in Thuringia between Gotha and Erfurt. One of these called Gleichen, the Wanderslebener Gleiche (1200 ft. above the sea), was besieged unsuccessfully by the emperor Henry IV. in 1088. It was the seat of a line of counts, one of whom, Ernest III., a crusader, is the subject of a romantic legend. Having been captured, he was released from his imprisonment by a Turkish woman, who returned with him to Germany and became his wife, a papal dispensation allowing him to live with two wives at the same time (see Reineck, Die Sage von der Doppelehe eines Grafen von Gleichen, 1891). After belonging to the elector of Mainz the castle became the property of Prussia in 1803. The second castle is called Mühlburg (1309 ft. above the sea). This existed as early as 704 and was besieged by Henry IV. in 1089. It was taken in 1081. In 1353 it was the scene of an assault by the troops of the Duke of Saxe-Coburg-Gotha, whose family obtained possession of it in 1368. It was built about 835 (see Beyer, Die drei Gleichen, Erfurt, 1898). The other group consists of two castles, Neuen-Gleichen and Alten-Gleichen. Both are in ruins and crown two hills about 2 m. S.E. from Göttinigen.

The name of Gleichen is taken by the family descended from Prince Victor of Hohenzollern-Hechingen through marriage with Miss Laura Seymour, daughter of Admiral Sir George Francis Seymour, a branch of the Hohenzollern family having at one time owned part of the county of Gleichen.

Gleig, George (1753-1840), Scottish divine, was born at Boghall, Kincardineshire, on the 12th of May 1753, the son of a farmer. At the age of thirteen he entered King's College, Aberdeen, where the first prize in mathematics and physical and moral sciences fell to him. In his twenty-first year he took orders in the Scottish Episcopal Church, and was ordained to the pastoral charge of a congregation at Pittenweem, Fife, whence he removed in 1790 to Stirling. He became a frequent contributor to the Monthly Review, the Gentleman's Magazine, the Anti-Jacobin Review and the British Critic. He also wrote several articles for the third edition of the Encyclopaedia Britannica, and on the death of the editor, Colin Macfarquhar, in 1793, was engaged to edit the remaining volumes. Among his principal contributions to this work were articles on "Instinct," "Theology" and "Metaphysics." The two supplementary volumes were mainly his own work. He was twice chosen bishop of Dunkeld, but the opposition of Bishop Skinner, afterwards primus, rendered the election on both occasions ineffectual. In 1808 he was consecrated assistant and successor to the bishop of Brechin, in 1810 was preferred to the sole charge, and in 1816 was elected primus of the Episcopal Church of Scotland, in which capacity he greatly aided in the introduction of many useful reforms, in fostering a more catholic and tolerant spirit, and in cementing a firm alliance with the sister church of England. He died at Stirling on the 9th of March 1840.

Besides various sermons, Gleig was the author of Directions for the Study of Theology, in a series of letters from a bishop to his son on his admission to holy orders (1827); an edition of Stockhouse's History of the Bible (1817); and a life of Robertson the historian, prefixed to an edition of his works. See Life of Bishop Gleig, by Mr W. Walker (1851). Letters to the Editor of Edinburgh and John Douglas, bishop of Salisbury, are in the British Museum.

His third and only surviving son, George Robert Gleig (1796-1888), was educated at Glasgow University, whence he passed with a Snell exhibition to Balliol College, Oxford. He abandoned his scholastic studies to enter the army, and served with distinction in the Peninsular War (1813-14), and in the American War, in which he was thrice wounded. Resuming his work at Oxford, he was made a fellow of Merton in 1817. He was elected a member of the Royal Society in 1820, held successively curacies at Westwell in Kent and Ash (to the latter the rectory of Ivy Church was added in 1822). He was subsequently appointed chaplain of Chelsea hospital (1824), chaplain-general of the forces (1844-1875) and inspector-general of military schools (1846-1857). From 1848 till his death on the 9th of July 1888 he was prebend of Willesden in St. Paul's cathedral. During the last sixty years of his life he was a prolific, if not very scientific, writer; he wrote for Blackwood's Magazine and Fraser's Magazine, and produced a large number of historical works.

Among the latter were (besides histories of the campaigns in which he served), Life of Sir Thomas Munro (3 vols., 1830); History of India (4 vols., 1830-1832); The Leopistic Campaign and Lives of the British Commanders (1813-1814), and various other works. His Life of Wellington (1860) and Warren Hastings (1848; the subject of Macaulay's essay, in which it is described as "three big bad volumes full of undigested correspondence and undiscovering panegyric").

Gleim, Johann Wilhelm Ludwig (1710-1803), German poet, was born on the 2nd of April 1719 at Ermelschen, near Halberstadt. Having studied law at the university of Halle he became secretary to Prince William of Brandenburg-Schwedt at Berlin, where he made the acquaintance of Ewald von Kleist, whose devoted friend he became. When the prince fell in the battle of Prague, Gleim became secretary to Prince Leopold of Dessau; but he soon gave up his position, not being able to bear the roughness of the "Old Dessauer." After residing a few years in Berlin he was appointed, in 1747, secretary of the cathedral chapter at Halberstadt. "Father Gleim" was the title accorded to him throughout all literary Germany on account of his kind-hearted though inconsiderate and indiscriminating patronage alike of the poets and poetasters of the period. He wrote a large number of feeble imitations of Anacreon, Horace and the minstrelsy, a dull didactic poem entitled Hallodar oder das rothe Buch (1774), and collections of fables and romances. Of higher merit are his Preussische Kriegslieder von einem Grenadier (1758). These, which were inspired by the campaigns of Frederick II., are often distinguished by genuine feeling and vigorous force of expression. They are also noteworthy as being the first of that long series of noble political songs in which later German literature is so rich. With this exception, Gleim's writings are for the most part tamely commonplace in thought and expression. He died at Halberstadt on the 18th of February 1803.

Gleim, Sämliche Schriften 7 vols., in the years 1811-1813; a reprint of the Lieder eines Grenadiers was published by...
GLEIWITZ—GLENCORSE

A. Saur in 1882. A good selection of Glei'm's poetry will be found in F. Mühlmann, Anakreontier und preussisch-patriatische Lyrik (1894). See W. Köpfe, Gleichs Leben aus seinen Briefen und Schriften (1891). His correspondence with Heine was published in 2 vols. (1894-1896), with Uz (1889), in both cases edited by C. Schülecke.

GLEIWITZ, a town of Germany, in the Prussian province of Silesia, on the Wipper, 16 m. N.W. of Berlin, and 26 m. N.E. of Breslau. It stands between Oppeln and Craczow, 40 m. S.E. of the former town. Pop. (1875) 14,156; (1905) 51,324. It possesses two Protestant and four Roman Catholic churches, a synagogue, a mining school, a convent, a hospital, two orphanages, and barracks. Gleiwitz is the centre of the mining industry of Upper Silesia. Besides the royal foundry, with which are connected machine manufactories and boiler-works, there are other foundries, meal mills and manufactories of wire, gas pipes, cement and paper.

See B. Nieraths, Geschichte der Stadt Gleiwitz (1886); and Seidel, Die königliche Eisenbahn zu Gleiwitz (Berlin, 1896).

GLENALMOND, a glen of Perthshire, Scotland, situated to the S.E. of Loch Tay. It comprises the upper two-thirds of the course of the Almond, or a distance of 20 m. For the greater part it follows a direction east by south, but at Newton Bridge it inclines sharply to the south-east for 3 m., and narrows to such a degree that this portion is known as the Small (or Sma') Glen. At the end of this pass the glen expands and runs eastwards as far as the well-known public school of Trinity College, where it may be considered to terminate. The most interesting spot in the glen is that traditionally known as the grave of Ossian. The district east of Buchanty, near which are the remains of a Roman camp, is said to be the Drumtoochy of Ian Maclaren's stories. The mountainous region at the head of the glen is dominated by Ben y graphic (3168 ft. high).

GLENCAIN, EARLS OF. The 1st earl of Glencain in the Scottish peerage was Alexander Cunningham (d. 1488), a son of Sir Robert Cunningham of Kilmours in Ayrshire. Made a lord of the Scottish parliament as Lord Kilmours not later than 1469, Cunningham was created earl of Glencain in 1488; and a few weeks later he was killed at the battle of Sauchieburn whilst fighting for King James III. against his rebellious son, afterwards James IV. His son and successor, Robert (d. c. 1490), was deprived of his earldom by James IV., but before 1505 this had been revived in favour of Robert's son, Cutibert (d. c. 1540), who became 3rd earl of Glencain, and whose son William (c. 1490–1547) was the 4th earl. This noble, an early adherent of the Reformation, was during his lifetime a famous general, and was active in England, although he fought on the Scottish side at the battle of Solway Moss (1542), where he was taken prisoner. Upon his release early in 1543 he promised to adhere to Henry VIII., who was anxious to bring Scotland under his rule, and in 1544 he entered into other engagements with Henry, undertaking inter alia to deliver Mary queen of Scots to the English king. However, he was defeated by James Hamilton, earl of Arran, and the project failed; Glencain then deserted his fellow-conspirator, Matthew Stewart, earl of Lennox, and came to terms with the queen-mother, Mary of Guise, and her party.

William's son, Alexander, the 5th earl (d. 1574), was a more pronounced reformer than his father, whose English sympathies he shared, and was among the intimate friends of John Knox. In March 1557 he signed the letter asking Knox to return to Scotland; in the following December he subscribed the first "band" of the Scottish reformers; and he anticipated Lord James Stewart, afterwards the regent Murray, in taking up arms against the regent, Mary of Guise, in 1558. Then, joined by Stewart and the lords of the congregation, he fought against the regent, and took part in the attendant negotiations with Elizabeth of England, whom he visited in London in December 1560. When in August 1561 Mary queen of Scots returned to Scotland, Glencain was made a member of her council; he remained loyal to her after she had been deserted by Murray, but in a few weeks rejoined Murray and the other Protestant lords, returning to Mary's side in 1566. After the queen had married the earl of Bothwell she was again forsaken by Glencain, who fought against her at Carberry Hill and at Langside.

The earl, who was always to the fore in destroying churches, abbeys and other "monuments of idolatry," died on the 23rd of November 1574. His short satirical poem against the Grey Friars is printed by Knox in his History of the Reformation.

JAMES, the 7th earl (d. c. 1622), took part in the seizure of James VI., called the raid of Ruthven in 1582. William, the 9th earl (c. 1610–1664), a somewhat lukewarm Royalist during the Civil War, was a party to the "engagement" between the king and the Scots in 1647; for this proceeding the Scottish parliament deprived him of his office as lord justice-general, and nominally of his earldom. In March 1653 Charles II. commissioned the earl to command the Royalist forces in Scotland, and adjust the arrival of the Duke of Monmouth and the insurrection of this year is generally known as Glencain's rising. After its failure he was betrayed and imprisoned, but although excepted from pardon he was not executed; and when Charles II. was restored he became lord chancellor of Scotland. After a dispute with his former friend, James Sharp, archbishop of St Andrews, he died at Belton in Haddingtonshire on the 30th of May 1664. This earl's son John (d. 1703), who followed his brother Alexander as 11th earl in 1670, was a supporter of the Revolution of 1688. His descendant, James, the 14th earl (1749–1791), is known as the author of the "Tory" or the "Scotsman" of the Fiddletown, and his participation in the rising of 1791 is generally considered. The 14th earl was never married, and when his brother and successor, John, died childless in September 1796 the earldom became extinct, although it was claimed by Sir Adam Ferguson, Bart., a descendant of the 10th earl.

GLENCOE, a glen in Scotland, situated in the north of Argyllshire. Beginning at the north-eastern base of Buchaille Etive, it takes a gentle north-westerly trend for 10 m. to its mouth on Loch Leven, a salt-water arm of Loch Linne. On both sides it is shut in by wild and precipitous mountains and its bed is swept by the Coe—Ossian's "dark Cona," which rises in the hills at its eastern end. About half-way down the glen the stream forms the tiny Loch Trechthon. Towards Invercoe the landscape acquires a softer beauty. Here Lord Strathcona, who, in 1864, purchased the heritage of the Macdonalds of Glencoe, built his stately mansion of Mount Royal. The principal mountains on the south side are the various peaks of Buchaille Etive, Stub Dearg (3345 ft.), Bidean nam Bian (3755 ft.) and Meall Mor (2215 ft.), and on the northern side the Paps of Glencoe (2430 ft.), Sgor nam Fiannaidh (3168 ft.) and Meall Dearg (3128 ft.). Points of interest are the Devil's Staircase, a steep, boulder-strewn "cut" (1754 ft. high) across the hills to Fort William; the Study; the cave of Ossian, where tradition says that he was born, and the Iona cross erected in 1883 by a Macdonald in memory of his clansmen who perished in the massacre of 1692. About 1 m. beyond the head of the glen is Kingshouse, a relic of the old coaching days, when it was customary for tourists to drive from Ballachulish via Tyndrum to Loch Lomond. Now the Glencoe excursion is usually made from Oban—by rail to Achnacloich, thence up Loch Etive, coach up Glen Etive and down Glencoe and steamer to Ballachulish at Oban. One mile to the west of the Glen lies the village of BALLACHULISH (pop. 1143). It is celebrated for its slate quarries, which have been worked since 1760. The industry provides employment for 600 men and the annual output averages 30,000 tons. The slate is of excellent quality and is used throughout the United Kingdom. Ballachulish is a station on the Callander and Oban extension line to Fort William (Caledonian railway). The pier and ferry are some 2 m. W. of the village.

GLENCORSE, JOHN INGLIS, LORD (1810–1891), Scottish judge, son of a minister, was born at Edinburgh on the 21st of August 1810. From Glasgow University he went to Balliol College, Oxford. He was admitted a member of the Faculty of Advocates, and soon became known as an eloquent and successful pleader. In 1852 he was made solicitor-general for
GLENDALOUGH—GLENDOWER, OWEN

Scotland in Lord Derby’s first ministry, three months later becoming Lord Advocate. In 1838 he resumed this office in Lord Derby’s second administration, being returned to the House of Commons as member for Stamford. He was responsible for the Universities of Scotland Act of 1838, and in the same year he was elevated to the bench as lord justice clerk. In 1867 he was made lord justice general of Scotland and lord president of the court of session, taking the title of Lord Glencairn. Outside his judicial duties he was responsible for much useful public work, particularly in the department of higher education. In 1869 he was elected chancellor of Edinburgh University, having already been rector of the university of Glasgow. He died on the 20th August 1891.

GLENDALOUGH, VALE OF, a mountain glen of Co. Wicklow, Ireland, celebrated and frequently visited both on account of its scenic beauty and, more especially, because of the collection of ecclesiastical remains situated in it. Fortunately for its appearance, it is not approached by any railway, but services of cars are maintained to several points, of which Rathdrum, 8½ m. S.E., is the nearest railway station, on the Dublin & South-Eastern. The glen is traversed by the stream of Glenaloe, a tributary of the Avonmore, expanding into small loughs, the Upper and the Lower. The former of these is walled by the abrupt heights of Camaderry (236½ ft.) and Lugduff (217½ ft.), and here the extreme narrowness of the valley adds to its grandeur; while lower down, where it widens, the romantic character of the scenery is enhanced by the scattered ruins of the former monastic settlement. These ruins have the collective name of the “Seven Churches.” The settlement owed its foundation to the hermit St Kevin, who is reputed to have died on the 3rd of June 618; and it rapidly became a seat of learning of wide fame, but suffered much at the hands of the Danes and the Anglo-Normans. In close proximity to an hotel, and to one another, in an enclosure, are a round tower, one of the finest in Ireland, 110 ft. high and 52 in circumference; St Kevin’s kitchen or church (closely resembling the house of St Columba at Kells), which measures 25 ft. by 15, with a high-pitched roof and round belfry—supposed to be the earliest example of its type; and the cathedral, about 73 ft. in total length by 51 in width. This possesses a good square-headed doorway, and an east window of ornate character (the chancel being of later date than the nave), and there are also some early tombs, but the whole is in a decayed condition. In the enclosure are also a Lady chapel, chiefly remarkable for its doorway of wrought granite, in a style of architecture resembling Greek; a priest’s house (restored), and slight remains of St Chiaran’s church. Here is also St Kevin’s cross, a granite monolith never completed; and the enclosure is entered by a fine though dilapidated gateway. Other neighbouring remains are Trinity or the Ivy Church, towards Laragh, with beautiful detailed work; St Saviour’s monastery, carefully restored under the direction of the Board of Works, with a chancel arch of three orders (re-erected); while on the shores of the upper lough are Reefton Church, the burial-place of the O’Toole family, and Teampull-na-skellig, the church of the rock. St Kevin’s bed is a cave approachable with difficulty, above the lough, probably a natural cavity artificially enlarged, to which attaches the legend of St Kevin’s hermitage. Along the valley there are a number of monuments and stone crosses of various sizes and styles. The whole collection forms, with the possible exception of Clonmacnoise in King’s county, the most striking monument of monasticism in Ireland.

GLENDOWER, OWEN (c. 1359-1415), the last to claim the title of an independent prince of Wales, more correctly described as Owain ab Gruffyd, lord of Glyndywydd in Merioneth, was a man of good family, with two great houses, Sycharth and Glyndywydd in the north, besides smaller estates in south Wales. His father was called Gruffyd Vychan, and his mother Helen; on both sides he had pretensions to be descended from the old Welsh princes. Owen was probably born about 1359, studied law at Westminster, was squire to the earl of Arundel, and a witness for Grosvenor in the famous Scrope and Grosvenor lawsuit in 1386. Afterwards he was in the service of Henry of Bolingbroke, the future king, though by an error it has been commonly stated that he was squire to Richard II. Welsh sympathies were, however, on Richard’s side, and combined with a personal quarrel to make Owen the leader of a national revolt.

The lords of Glyndywydd had an ancient feud with their English neighbours, the Greys of Ruthin. Reginald Grey neglected to summon Owen, as was his duty, for the Scottish expedition of 1400, and then charged him with treason for failing to appear. Owen thereupon took up arms, and when Henry IV. returned from Scotland in September he found north Wales ablaze. A hurried campaign under the king’s personal command was ineffectual. Owen’s estates were declared forfeit and vigorous measures threatened by the English government. Still the revolt gathered strength. In the spring of 1401 Owen was raiding in south Wales, and credited with the intention of invading England. A second campaign by the king in the autumn was defeated, like that of the previous year, through bad weather and the Fabian tactics of the Welsh. Owen had already been intriguing with Henry Percy (Hotspur), who during 1401 held command in north Wales, and with Percy’s brother-in-law, Sir Edmund Mortimer. During the winter of 1401–1402 his plans were further extended to negotiations with the rebel Irish, the Scots and the French. In the spring he had grown so strong that he attacked Ruthin, and took Grey prisoner. In the summer he defeated the men of Hereford under Edmund Mortimer at Pilleth, near Brynglas, in Radnorshire. Mortimer was taken prisoner and treated with such friendliness as to make the English doubt his loyalty; within a few months he married Owen’s daughter. In the autumn the English king was for the third time driven back to the border and was beaten back.” The few English strongholds left in Wales were now hard pressed, and Owen boasted that he would meet his enemy in the field. Nevertheless, in May 1405 Henry of Monmouth was allowed to sack Sycharth and Glyndywydd unopposed. Owen had a greater plot in hand. The Percies were to rise in arms, and meeting Owen at Shrewsbury, overwhelm the prince before help could arrive. But Owen’s share in the undertaking miscarried through his own defeat near Carmarthen on the 17th of July, and Percy was crushed at Shrewsbury ten days later. Still the Welsh revolt was never so formidable. Owen styled himself openly prince of Wales, established a regular government, and called a parliament at Machynlleth. As a result of a formal alliance the French sent troops to his aid, and in the course of 1404 the great castles of Harlech and Aberystwith fell into his hands.

In the spring of 1405 Owen was at the height of his power; but the tide turned suddenly. Prince Henry defeated the Welsh at Grosmont in March, and twice again in May, when Owen’s son Griffith and his chancellor were made prisoners. Scrope’s rebellion in the North prevented the English from following up their success. The earl of Northumberland took refuge in Wales, and the tripartite alliance of Owen with Percy and Mortimer (transferred by Shakespeare to an earlier occasion) threatened a renewal of danger. For Northumberland’s plots and the active help of the French proved ineffectual. The English under Prince Henry gained ground steadily, and the recovery of Aberystwith, after a long siege, in the autumn of 1408 marked the end of serious warfare. In February 1409 Harlech was also recaptured, and Owen’s wife, daughter and grandchildren were taken prisoners. Owen himself still held out, and even continued to intrigue with the French. In July 1415 Gilbert Talbot had power to treat with Owen and his supporters and admit them to pardon. Owen’s name does not occur in the document renewing Talbot’s powers in February 1416; according to Adam of Usk he died in 1415. Later English writers allege that he died of starvation in the mountains; but Welsh legend represents him as spending a peaceful old age with his sons-in-law at Ewys and Monington in Herefordshire, till his death and burial at the latter place. The dream of an independent and united Wales was never nearer realization than under Owen’s leadership. The disturbed state of England
helped him, but he was indeed a remarkable personality, and has not undeservedly become a national hero. Sentiment and tradition have magnified his achievements, and confused his career with tales of portents and magical powers. Owen left many bastard children; his legitimate representative in 1433 was his daughter Alice, wife of Sir John Scudamore of Eywas.

The facts of Owen's life must be pieced together from scattered references. Of his oratorical powers the most important are Adam of Usk's Chronicle and Ellis's Original Letters. On the Welsh side something is given by the bardic Iolo Gezch and Lewis Glyn Cothi. For modern accounts consult I. B. Wilkins, History of England under Henry IV. (4 vols., 1884-1898); A. C. Bradley's popular biography; and Professor Tout's article in the Dictionary of National Biography.

GLENGEL—GLEYRE

GLENGEL, CHARLES GRANT, BARON (1778-1860), eldest son of Charles Grant (q.q.), chairman of the directors of the East India Company, was born in India on the 26th of October 1778, and was educated at Magdalen College, Cambridge, of which he became a fellow in 1802. Called to the bar in 1807, he was elected member of parliament for the Inverness burghs in 1807, and having gained some reputation as a speaker in the House of Commons, he was made a lord of the treasury in December 1813, an office which he held until August 1819, when he became secretary to the lord-lieutenant of Ireland and privy councillor. In 1825 he was appointed vice-president of the board of trade; from September 1825 to June 1828 he was president of the board and treasurer of the navy; then joining the Whigs, he was president of the board of control under Earl Grey and Lord Melbourne from November 1830 to November 1834. At the board of control Grant was primarily responsible for the act of 1833, which altered the constitution of the government of India. In April 1835 he became secretary for war and the colonies, and was created Baron Glenelg. His term of office was a stormy one. His differences with Sir Benjamin d'Urban (q.q.), governor of Cape Colony, were serious; but more so were those with King William IV, and others over the administration of Canada. He was still secretary when the Canadian rebellion broke out in 1837; his wavering and feeble policy was fiercely attacked in parliament; he became involved in disputes with the earl of Durham, and the movement for his supercession found supporters even among his colleagues in the cabinet. In February 1839 he resigned, receiving consolatory in the shape of a pension of £2000 a year. From 1818 until he made a peer Grant represented the county of Inverness in parliament, and he has been called "the last of the Cantabrigians." Like many mainstays during the concluding years of his life, he died unmarried at Cannes on the 23rd of April 1866 when his title became extinct.

Glenelg's brother, Sir Robert Grant (1779-1838), who was third wrangler in 1801, was, like his brother, a fellow of Magdalen College, Cambridge, and a barrister. From 1818 to 1834 he represented various constituencies in parliament, where he was chiefly prominent for his persistent efforts to relieve the disabilities of the Jews.1 In June 1834 he was appointed governor of Bombay, and he died in India on the 9th of July 1838. Grant wrote a Sketch of the History of the East India Co. (1813), and is also known as a writer of hymns.

GLENGEL, a municipal town and watering place of Adelaide county, South Australia, on Holdfast Bay, 63 m. by rail S.S.W. of the city of Adelaide. Pop. (1901) 3949. It is a popular summer resort, connected with Adelaide by two lines of railway. In the vicinity is the "Old Gum Tree" under which South Australia was proclaimed British territory by Governor Hindmarsh in 1836.

GLENGARRIFF, or GLENGARR ("Rough Glen"), a celebrated resort of tourists in summer and invalids in winter, in the west riding of county Cork, Ireland, on Glengarriff Harbour, an inlet on the northern side of Bantry Bay, 17 m. by coach road from Bantry on the Cork, Bandon & South Coast railway. Beyond its hotels, Glengarriff is only a small village, but the island-studded harbour, the narrow glen at its head and the surrounding

1 Sir S. Walpole (History of England, vol. v.) is wrong in stating that Charles Grant introduced bills to remove Jewish disabilities in 1833 and 1834. They were introduced by his brother Robert.

of mountains, afford most attractive views, and its situation on the "Prince of Wales" route travelled by King Edward VII. in 1848, and on a fine mountain coach road from Macroom, brings it into the knowledge of many travellers to Killarney. Thackeray wrote enthusiastically of the harbour. The glaciated rocks of the glen are clothed with vegetation of peculiar luxuriance, flourishing in the mild climate which has given Glengarriff its high reputation as a health resort for those suffering from pulmonary complaints.

GLENS, a division of the Cape province south of the Stormberg, adjoining on the east the Transkeian Territories. Pop. (1904) 55,107. Chief town Lady Frere, 32 m. N.E. of Queens-town. The district is well watered and fertile, and large quantities of cereals are grown. Over 96% of the inhabitants are of the Zulu-Xosa (Kaffir) race, and a considerable part of the district was settled during the Kaffir wars of Cape Colony by Tembu (Tambookies) who were granted a location by the colonial government in recognition of their loyalty to the British. Act No. 25 of 1894 of the Cape parliament, passed at the instance of Cecil Rhodes, which laid down the basis upon which is effected the change of land tenure by natives from communal to individual holdings, and also dealt with native local self-government and the labour question, applied in the first instance to this division, and is known as the Glen Grey Act (see CAPE COLONY: History). The provisions of the act respecting individual land tenure and local self-government were in 1898 applied to the Transkeian Territories.

GLENS FALLS, a village of Warren county, New York, U.S.A., 55 m. N. of Troy, on the Hudson river. Pop. (1890) 9500; (1900) 12,613, of whom 1762 were foreign-born; (1910 census) 15,243. Glens Falls is served by the Delaware & Hudson and the Hudson Valley (electric) railways. The village contains a state armory, the Crandall free public library, a Y.M.C.A. building, the Park hospital, an old ladies' home, and St Mary's (Roman Catholic) and Glen Falls (non-sectarian) churches. There are two private clubs open to the public, and a waterworks system is maintained by the village. An iron bridge crosses the river just below the falls, connecting Glen Falls and South Glen Falls (pop. in 1910, 2247). The falls of the Hudson here furnish a fine water-power, which is utilized, in connexion with steam and electricity, in the manufacture of lumber, paper and wood pulp, women's clothing, shirts, collars and cuffs, &c. In 1905 the village's factory products were valued at $4,780,331. About 12 m. above Glens Falls, on the Hudson, a massive stone dam has been erected; here electric power, with certain modifications, is generated. In the neighbourhood of Glens Falls are quarries of black marble and limestone, and lime, plaster and Portland cement works. Glen Falls was settled about the close of the French and Indian War (1753), and was incorporated as a village in 1839.

GLENLINT, a glen in the extreme north of Perthshire, Scotland. Beginning at the confines of Aberdeenshire, it follows a north-westerly direction excepting for the last 4 m., when it runs due S. to Blair Atholl. It is watered throughout by the Tilt, which enters the Garry after a course of 14 m., and receives on its right the Tarff, which forms some beautiful falls just above its entrance, and on the left the Fender, which has some fine falls also. The attempt of the 6th duke of Atholl (1814-1864) to close the glen to the public was successfully contested by the Scottish Rights of Way Society. The group of mountains—Carn nan Gabhr (3505 ft.), Ben y Gloc (3671) and Carn Liath (3103)—on its left side dominate the lower half of the glen. Marble of good quality is occasionally quarried in the glen, and the rock formation has attracted the attention of geologists from the time of James Hutton.

GLEYRE, MARC CARLOS GARIBALDI (1806-1874), French painter, of Swiss origin, was born at Chevilly in the canton of Vaud on the 2nd of May 1806. His father and mother died while he was yet a boy of some eight or nine years of age; and he was brought up by an uncle at Lyons, who sent him to the industrial school of that city. Going up to Paris a lad of
GLIDDON—GLINKA, M. I.

seventeen or nineteen, he spent four years in close artistic study—
in Hersent's studio, in Suisse's academy, in the galleries of the Louvre. To this period of laborious application succeeded four years of meditative inactivity in Italy, where he became acquainted with Horace Vernet and Léopold Robert; and six years more were consumed in adventurous wanderings in Greece, Egypt, Nubia and Syria. At Cairo he was attacked with ophthalmia, and in the Lebanon he was struck down by fever; and he returned to Lyons in shattered health. On his recovery he proceeded to Paris, and, fixing his modest studio in the rue de Université, began carefully to work out the conceptions which had been slowly shaping themselves in his mind. Mention is made of two decorative panels—' Diana leaving the Bath,' and a 'Young Nubian'—as almost the first fruits of his genius; but these did not attract public attention till long after, and the painting by which he practically opened his artistic career was the "Apocalyptic Vision of St John," sent to the Salon of 1840. This was followed in 1843 by "Evening," which at the time received a medal of the second class, and afterwards became widely popular under the title of the Lost Illusions. It represents a poet seated on the bank of a river, with drooping head and weary frame, letting his lyre slip from a careless hand, and gazing sadly at a bright company of maidens whose song is slowly dying from his ear as their boat is borne slowly from his sight.

In spite of the success which attended these first ventures, Gleyre retired from public competition, and spent the rest of his life in quiet devotion to his own artistic ideals, neither seeking the easy applause of the crowd, nor turning his art into a means of aggrandisement and wealth. After 1845, when he exhibited the "Separation of the Apostles," he contributed nothing to the Salon except the "Dance of the Bacchantes" in 1849. Yet he laboured steadily and was abundantly productive. He had an "infinite capacity of taking pains," and when asked by what method he attained to so marvellous perfection of workmanship, he would reply, "En y pensant toujours." A long series of years often intervened between the first conception of a piece and its embodiment, and years not unfrequently between the first and the final stage of the embodiment itself. A landscape was apparently finished; even his fellow artists would consider it done; Gleyre alone was conscious that he had not "found his sky." Happily for French art this high-toned laboriousness became influential on a large number of Gleyre's younger contemporaries; for when Delaroche gave up his studio of instruction he recommended his pupils to apply to Gleyre, who at once agreed to give them lessons twice a week, and characteristically refused to take any fee or reward. By instinct and principle he was a confirmed celibate: "Fortune, talent, health, he had everything; but he was married," was his lamentation over his unfulfilled life. This completely detached from public life, he took a keen interest in politics, and was a voracious reader of political journals. For a time, indeed, under Louis Philippe, his studio had been the rendezvous of a sort of liberal club. To the last—amid all the disasters that befall his country—he was hopeful of the future, "la raison finira bien par avoir raison." It was while on a visit to the Retrospective Exhibition, opened on behal of the exiles from Alsace and Lorraine, that he died suddenly on the 5th of May 1874. He left unfinished the "Earthly Paradise," a noble picture, which Taine has described as "a dream of innocence of happiness and of beauty—Adam and Eve standing in the sublime and joyous landscape of a paradise enclosed in mountains,"—a worthy counterpart to the "Evening." Among the other productions of his genius are the "Deluge," which represents two angels speeding above the desolate earth, from which the destroying waters have just begun to retire, leaving visible behind them the ruin they have wrought; the "Battle of the Lemanus," a piece of elaborate design, crowded but not cumbered with figures, and giving fine expression to the movements of the various bands of combatants and fugitives; the "Prodigal Son," in which the artist has ventured to add to the parable the new element of mother's love, greeting the repentant youth with a welcome that shows that the mother's heart thinks less of the repentance than of the return; "Ruth and Boaz"; "Ulysses and Nausicaa," "Hercules at the feet of Omphale"; the "Young Athenian," or, as it is popularly called, "Sappho"; "Minerva and the Nymphs"; "Venus ravigous"; "Daphnis and Chloe"; and "Love and the Paracel." Nor must it be omitted that he left a considerable number of drawings and water-colours, and that we are indebted to him for a number of portraits, among which is the sad face of Heine, engraved in the Revue des deux mondes for April 1842. In Clémence's catalogue of his works there are 683 entries, including sketches and studies.

See Friz Bethournd in Bibliothèque universelle de Genève (1874); Albert de Montet, Dict. biographique des Génois et des Vaudois (1877); and Vie de Charles Gleyre (1877), written by his friend, Charles Clémence, and illustrated by 30 plates from his works.

GLIDDON, GEORGE ROBINS (1809–1857), British Egyptologist, was born in Devonshire in 1809. His father, a merchant, was United States consul at Alexandria, and there Gliddon was taken at an early age. He became United States vice-consul, and took a great interest in Egyptian antiquities. Subsequently he lectured in the United States and succeeded in rousing considerable attention to the subject of Egyptology generally. He died at Panama in 1857. His chief work was Ancient Egypt (1850, ed. 1853). He wrote also Memoir on the Cotton of Egypt (1841); Appeal to the Antiquaries of Europe on the Destruction of the Monuments of Egypt (1841); Discourses on Egyptian Archaeology (1841); Types of Mankind (1854), a collaboration with J. C. Nott and others; Indigenous Races of the Earth (1857), and another quaintly entitled A Manual of Egyptology (1857).

GLINKA, FEDOR KILOLEAVICH (1789–1849), Russian poet and author, was born at Smolensk in 1788, and was specially educated for the army. In 1803 he obtained a commission as an officer, and two years later took part in the Austrian campaign. His tastes for literary pursuits, however, soon induced him to leave the service, whereupon he withdrew to his estates in the government of Smolensk, and subsequently devoted most of his time to study or travelling about Russia. Upon the invasion of the French in 1812, he re-entered the Russian army, and remained in active service until the end of the campaign in 1814. Upon the elevation of Count Milarodovitch to the military governorship of St. Petersburg, Glinka was appointed colonel under his command. On account of his suspected revolutionary tendencies he was, in 1826, banished to Petrozavodsk, but he nevertheless retained his honorary post of president of the Society of the Friends of Russian Literature, and was after a time allowed to return to St. Petersburg. Soon afterwards he retired completely from public life, and died on his estates in 1849.

Glinka's martial songs have special reference to the Russian military campaigns of his time. He is known also as the author of the descriptive poem Kareliya, &c. (Carélia, or the Captivity of Martha Joanna) (1830), and of a metrical paraphrase of the book of Job. His fame as a military author is chiefly due to his Pisma Raiskago Ofisera (Letters of a Russian Officer) (8 vols., 1815–1816).

GLINKA, MICHAEL IVANOVICH (1803–1857), Russian musical composer, was born at Novospassky, a village in the Smolensk government, on the 2nd of June 1803. His early life he spent at home, but at the age of thirteen we find him at the Blagorodrey Pension, St. Petersburg, where he studied music under Carl Maier and John Field, the Irish composer and pianist, who had settled in St. Petersburg. In his seventeenth year he had already begun to compose romances and other minor vocal pieces; but of these nothing now is known. His thorough musical training did not begin till the year 1830, when he went abroad and stayed for three years in Italy, to study the works of old and modern Italian masters. His thorough knowledge of the requirements of the voice may be connected with this course of study. His training as a composer was finished under the contrapuntist Dehn, with whom Glinka stayed for several months at Berlin. In 1833 he returned to Russia, and devoted himself to operatic composition. On the 27th of September (9th of October) 1836, took place the first representation of his opera Life for the Tsar (the libretto by Baron
Glinka, S. N.—Glockenspiel

123

de Rosen). This was the turning-point in Glinka's life,—for
the work was not only a great success, but in a manner became
the origin and basis of a Russian school of national music.

The story is taken from the invasion of Russia by the Poles early in the 17th century, and the hero is a peasant who sacrifices his life for the tsar. Glinka has wedded this patriotic theme to inspiring music. His melodies, moreover, show distinct affinity to the popular songs of the Russians, so that the term "national" may justly be applied to them. His appointment as imperial chaplain and conductor of the opera of St Petersburg was the reward of his dramatic successes. His second opera, Russian and Lyudmila, founded on Pushkin's poem, did not appear till 1842; it was an advance upon Life for the Tsar in its musical aspect, but made no impression upon the public. In the meantime Glinka wrote an overture and four entre-actes to Kuoklin's drama Prince Khokhlov. In 1844 he went to Paris, and his Jota Arragonesa (1847), and the symphonic work on Spanish themes, Une Nuit à Madrid, reflect the musical results of two years' sojourn in Spain. On his return to St Petersburg he wrote and arranged several pieces for the orchestra, amongst which the so-called Kamarsinskaya achieved popularity beyond the limits of Russia. He also composed numerous songs and romances. In 1857 he went abroad for the third time; he now wrote his autobiography, orchestrated Weber's Invitation à la volée, and began to consider a plan for a musical version of Gogol's Tarass-Boulba. Abandoning the idea and becoming absorbed in a passion for ecclesiastical music he went to Berlin to study the ancient church modes. Here he died suddenly on the 2nd of February 1857.

Glinka, Sergh Nikolaievich (1774-1847), Russian author, the elder brother of Fedor N. Glinka, was born at Smolensk in 1774. In 1796 he entered the Russian army, but after three years' service retired with the rank of major. He afterwards employed himself in the education of youth and in literary pursuits, first in the Ukraine, and subsequently at Moscow, where he died in 1847. His poems are spirited and patriotic; he wrote also several dramatic pieces, and translated Young's Night Thoughts.

Among his numerous prose works the most important from an historical point of view are: Russkoe Cheteni (Russian Reading: Historical Memorials of Russia in the 18th and 19th Centuries) (2 vols., 1845); Istoriya Rossi, &c. (History of Russia for the use of Youth) (10 vols., 1871-1819, 2nd ed. 1822, 3rd ed. 1824); Istoriya Armyan, &c. (History of the Migration of the Armenians of Azerbaijan from Turkey to Russia) (1831); and his contributions to the Russkyy Vyezrik (Russian Messenger), a monthly periodical, edited by him from 1808 to 1829.

Globe-Fish, or Sea-Hedgehog, the names by which some sea-fishes are known, which have the remarkable faculty of inflating their stomachs with air. They belong to the families Diodontidae and Tetrodontidae. Their jaws resemble the sharp beak of a parrot, the bones and teeth being coalesced into one mass with a sharp edge. In the Diodonts there is no neural division of the jaws, whilst in the Tetrodons such a division exists, so that they appear to have two teeth above and two below. By means of these jaws they are able to break off branches of corals, and to masticate other hard substances on which they feed. Usually they are of a short, thick, cylindrical shape, with powerful fins (fig. 1). Their body is covered with thick skin, without scales, but provided with variously formed spines, the size and extent of which vary in the different species. When they inflate their capacious stomachs with air, they assume a globular form, and the spines protrude, forming a more or less formidable defensive armour (fig. 2). A fish thus blown out turns over and floats belly upwards, driving before the wind and waves. Many of these fishes are highly poisonous when eaten, and fatal accidents have occurred from this cause. It appears that they acquire poisonous qualities from their food, which frequently consists of decomposing or poisonous animal matter, such as would impart, and often does impart, similar deleterious qualities to other fish. They are most numerous between the tropics and in the seas contiguous to them, but a few species live in large rivers, as, for instance, the Tetrodon fhaka, a fish well known to all travellers on the Nile. Nearly 100 different species are known.

Globigerina, A. d'Orbigny, a genus of Perisote Foraminifera (fig.) of pelagic habit, and formed of a conical spiral aggregate of spheroidal chambers with a crescentic mouth. The shells accumulate at the bottom of moderately deep seas to form "Globigerina ooze" and are preserved thus in the chalk. Hastingera only differs in the "flat" or nautiloid spiral.

Glockenspiel, or Orchestral Bells (Fr. carillon; Ger. Glockenspiel, Stahlharmonika; Ital. campanelli; Med. Lat. tininamabulum, cymbalum, bombulum), an instrument of percussion of definite musical pitch, used in the orchestra, and made in two or three different styles. The oldest form of glockenspiel, seen in illuminated MSS. of the middle ages, consists of a set of bells mounted on a frame and played by one performer by means of steel hammers. The name "bell" is now generally a misnomer, other forms of metal or wood having been found more convenient. The pyramid-shaped glockenspiel, formerly used in the orchestra for simple rhythmical effects, consists of an octave of semitone, hemispherical bells, placed one above the other and fastened to an iron rod which passes through the centre of each, the bells being of graduated sizes and diminishing in diameter as the pitch rises. The lyre-shaped glockenspiel, or steel harmonica (Stahlharmonika), is a newer model, which has instead of bells twelve, or more bars of steel, graduating in size according to their pitch. These bars are fastened horizontally across two bars of steel set perpendicularly in a steel frame in the shape of a lyre. The bars are struck by little steel hammers attached to whalebone sticks.

Wagner has used the glockenspiel with exquisite judgment in the fire scene of the last act of Die Walküre and in the peasants' waltz in the last scene of Die Meistersinger. When chords are written for the glockenspiel, as in Mozart's Magic Flute, the keyed harmonica is used. It consists of a keyboard having a little hammer attached to each key, which strikes a bar of glass or steel when the key is depressed. The performer, being able to use both hands, can play a melody with full harmonies, scale and arpeggio passages in single and double notes. A peal of hemispherical bells was specially constructed for Sir Arthur Sullivan's Golden Legend. It consists of four bells constructed of bell-metal about 1 in. thick, the largest measuring 27 in. in diameter, the smallest 23. They are fixed on a stand one above the other, with a clearance of about 1 in. between them; the rim of the lowest and largest bell is 15 in. from the foot of the stand. The bells are struck by mallets, which are of two kinds—a pair of hard wood for forte passages, and a pair covered

with wash-leather for piano effects. The peal was unique at the time it was set up in 1873. The Golden Legend, a smaller bell of the same shape, 4 in. thick, with a diameter measuring about 16 in., was specially made for the performance of Liszt's St Elisabeth, when conducted by the composer in London, evidently suggested the idea for the peal.

GLOGAU, a fortified town of Germany, in the Prussian province of Silesia, 50 m. N.W. from Breslau, on the railway to Frankfort-on-Oder. Pop. (1905) 23,461. It is built partly on an island and partly on the left bank of the Oder; and owing to the fortified enceinte having been pushed farther afield, new quarters have been opened up. Among its most important buildings are the cathedral, in the Gothic, and a castle (now used as a courthouse), in the Renaissance style, two other Roman Catholic and three Protestant churches, a new town-hall, a synagogue, a military hospital, two classical schools (Gymnasien) and several libraries. Owing to its situation on a navigable river and at the junction of several lines of railway, Glogau carries on an extensive trade, which is fostered by a variety of local industries, embracing machinery-building, tobacco, beer, oil, sugar and vinegar. It has also extensive lithographic works, and its wool market is celebrated.

In the beginning of the 11th century Glogau, even then a populous and fortified town, was able to withstand a regular siege by the emperor Henry V.; but in 1137 the duke of Silesia, finding he could not hold out against Frederick Barbarossa, set fire to it. In 1259 the town, which had been raised from its ashes by Henry L. the Bearded, became the capital of a principality of Glogau, and in 1482 town and district were united to the Bohemian crown. In the course of the Thirty Years' War Glogau suffered greatly. The inhabitants, who had become Protestants soon after the Reformation, were dragged into conformity by Wallenstein's soldiery; and the Jesuits received permission to build themselves a church and a college. Captured by the Protestants in 1632, and recovered by the Imperialists in 1633, the town was again captured by the Swedes in 1642, and the Dutch in 1643 by the Protestant Prince: it fell into the hands of Henry VI, who had gallantly upheld the Jewish and the Russian and Prussian besiegers, when the battle of Kutzbach in August 1813 until the 17th of the following April.

See Minsberg, Geschichte der Stadt und Festung Glogau's (2 vols., Glogau, 1853); and H. von Below, Zur Geschichte des Jahres 1860 Glogau's Belagerung und Verteidigung (Berlin, 1893).

GLORIA, in botany, a small genus of plants belonging to the natural order Lilaceous, native of tropical Asia and Africa. They are bulbous plants, the slender stems of which support themselves by tendril-like prolongations of the tips of some of the narrow generally lanceolate leaves. The flowers, which are borne in the leaf-axils at the ends of the stem, are very handsome, the six, generally narrow, petals are bent back and stand cleft, and are a rich orange yellow or red in colour; the six stamens project more or less horizontally from the place of insertion of the petals. They are generally grown in cultivation as stock-plants.

GLORY (through the O. Fr. glorie, modern gloire, from Lat. gloria, cognate with Gr. κλέος, κλήσις), a synonym for fame, renown, honour, and thus used of anything which reflects honour and renown on its possessor. In the phrase "glory of God" the word implies both the honour due to the Creator, and His majesty and effulgence. In liturgies of the Christian Church are the Gloria Patri, the doxology beginning "Glory be to the Father," the response Gloria tibi, Domine, "Glory be to Thee, O Lord" sung or said after the giving out of the Gospel for the day, and the Gloria in excelsis, "Glory be to God on high," sung during the Mass and Communion service. A "glory" is the term often used as synonymous with halo, nimbus or aureola (q.v.) for the ring of light encircling the head or figure in a pictorial or other representation of sacred persons.

GLOSSARY, &c. The Greek word γλώσσα (whence our "gloss"), meaning originally a tongue, then a language or dialect, gradually came to denote any obsolete, foreign, provincial, technical or otherwise peculiar word or use of a word (see Arist. Rh. iii. 3. 2). The making of collections and explanations of such words was at an early period a recognized form of literary activity. Even in the 5th century B.C., among the many writings of Abdera was included a treatise entitled Περὶ Ὠμορίων ἢ δροσερῶν καὶ γλωσσῶν. It was not, however, until the Alexandrian period that the γλώσσογράφοι, glossographers (writers of glosses), or glossators, became numerous. Of many of these perhaps even the names have perished; but Athenaeus the grammarian alone (c. A.D. 250) adds to no fewer than thirty-five. Among the earliest was Philetas of Cos (d. c. 290 B.C.), the elegiac poet, to whom Aristarchus dedicated the treatise Πρὸς Φλαττῶν; he was the compiler of a lexico-graphical work, arranged roughly according to subjects, and entitled Ἀτακτικά or Γλώσσαι (sometimes "Ἀταικοι γλώσσαι"). Next came his disciple Zenodotus of Ephesus (c. 280 B.C.), one of the earliest of the Homeric critics and the compiler of Γλώσσαι Ὀμηρικαί; Zenodotus in turn was succeeded by his greater pupil Aristophanes of Byzantium (c. 220 B.C.), whose great compilation Περὶ λέξεων (still partially preserved in that of Pollux), is known to have included Ἀτακτικά λέξεων, Ἀθροικά γλώσσαι, and the like. From the school of Aristophanes issued more than one glossographer of name, Diocles, Aristarchus, and Arsenius. The glossary collection of λέξεων ὑφαντικών, Nicander of Colophon (Γλώσσαι, of which some twenty-six fragments still survive), and Aristarchus (c. 210 B.C.), the famous critic, whose numerous labours included an arrangement of the Homeric vocabulary (λέξεων) in the order of the books. Contemporary with the last named was Crates of Mallus, who, besides making some new contributions to Greek lexicography and dialectology, was the first to create at Rome a taste for similar investigations in connexion with the Latin idioms. From his school proceeded Zenodotus of Mallus, whose collections of homeric λέξεων (Zeno's Lexicon) was the work said to have been designed chiefly to support the views of the school of Pergamum as to the allegorical interpretation of Homer. Of later date were Didymus (Chalcenterus, c. 50 B.C.), who made collections of λέξεων γραμματικών κοιμικών, &c.; Apollonius Sophista (c. 20 B.C.), whose Homeric Lexicon has come down to modern times; and Neopolemos, known distinctively as τῆς γλώσσογραφίας. In the beginning of the 1st century of the Christian era Apion, a grammarian and rhetorician at Rome during the reigns of Tiberius and Claudius, followed up the labours of Aristarchus and other predecessors with Λόγια Ομηρικά, a treatise Περὶ τῆς Παμφθημεῖας διαλέκτου; Heliodorus or Herodorus was another almost contemporary glossographer; Erotian also, during the reign of Nero, prepared a special glossary for the writings of Hippocrates, still preserved. To this period also Pamphilus, the author of the Λεμών, from which Diogenian and Julius Vestinus afterwards drew so largely, most probably belonged. In the following century one of the most prominent workers in this department of literature was Aelius Herodianus, whose treatise Περὶ μονοσύνων λέξεων has been edited in modern times, and whose Εἰκοσιομετρία we still possess in an abridgment; Diogenianus (Λέξεις παρθενικά), Julius Vestinus (Ἐνεργηθέν τῶν Παρμθῆμα τῶν γλώσσων) and especially Phrynichus, who flourished towards the close of the 2nd century, and whose Eclogae nominum et verborum Attlicorum has frequently been edited. To the 4th century belongs Ammonius of Alexandria (c. 380), who wrote Περὶ ὁμοιῶν καὶ διαφόρων λέξεων, a dictionary of words used in senses different from those in which they had
GLOSS, GLOSSARY

been employed by older and approved writers. Of somewhat later date is the well-known Hesychius, whose often-edited Lexicon superseded all previous works of the kind; Cyril, the celebrated patriarch of Alexandria, also contributed somewhat to the advancement of glossography by his Συγκεκριμένη τῶν πρὸς διάφοροι σημασίας διάφοροι γνωμάτες; while Orus, Orion, Philoxenus and the two Philemos also belong to this period. The works of Photis, Suidas and Zonaras, as also the Etymologicum magnum, to which might be added the Lexica Sangermanica and the Lexica Segueriniana, are referred to in the article DICTIONARY.

To a special category of technical glossaries belongs a large and important class of works relating to the law-compilations of Justinian. Although the emperor forbade under severe penalties all commentaries (συνομιλία) on his legislation (Const. Dei Auctore, sec. 12; Const. Tantia, sec. 21), yet indices (διάκεισ) and references (παρακείμενα), as well as translations (ἐπιΓνωσθείς κατὰ πόδα) and paraphrases (ἐπιγνωσθείς εἰς πλάνον), were expressly permitted, and lavishly produced. Among the numerous compilers of alphabetically arranged λέξεις Ρωμαϊκαί or Αντικυκλικαί, and γλώσσαι νομικά (glossae nomicae), Cyril and Leo, with some of the other Particular Notitiæ, although not the compiler of the Paragraphe, or σημειώσεις, whether εξακολουθοῦνει κειμένων, are too numerous to mention. A collection of these παραγράφαι τῶν παλαίων, combined with πείρα παραγράφαι on the revised code called τὰ βασιλικά, was made about the middle of the 11th century by a disciple of Michael Hagiototheorita.

This work is known as the Glossa ordinaria τῶν βασιλικῶν.1

In Italy, also, during the period of the Byzantine ascendency, various glossae (glosses) and scholia on the Justinian code were produced; particularly the Turin gloss (reprinted by Savigny), to which, apart from later additions, a date prior to 1000 is usually assigned. After the total extinction of the Byzantine authority in the West the study of law became one of the free arts, and numerous schools for its cultivation were instituted. Among the earliest of these was that of Bologna, where Pepo (1075) and Inerius (1100-1118) began to give their explications. They had a numerous following who, besides delivering exegetical lectures ("ordinariae" on the Digest and Code, "extraordinariae" on the rest of the Corpus juris civilis), also wrote Glossae, first interlinear, afterwards marginal.2 The series of these glossators was closed by Accursius (q.v.) with the compilation known as the Glossa ordinaria or magistralis, the authority of which soon became very great, so that ultimately it came to be a recognized maxim, "Quod non agnoscit glossa, non agnoscit curia."3 For some account of the glossators on the canon law, see CANON LAW.

In late classical and medieval Latin, glossa was the vulgar and romanic (e.g. in the early 8th century Corpus Glossary, and the late 8th century Leiden Glossary), glossa the learned form (Varro, De ling. Lat. vii. 10; Auson. Epigr. 127, 2 (86. 2), written in Greek, Quint. i. 1. 34). The diminutive glossula occurs in Dio. 426. 26 and elsewhere. The same meaning has glossarium (Gell. xviii. 7. 5 glossarium = γλωσσάριον), which also occurs in the modern sense of "glossary" (Papas, "und glossarium dictum quod omnium fere partium glossas continent "), as do the words glossa, glossae, glossulae, glossmata (Steinmeyer, Alth. Gloss. iv. 408, 410), expressed in later times by dictionarium, dictionarius, vocabularium (see DICTIOGRAPHY). Glossa and glossa (Varro vii. 34. 107; Asinius Gallus, ap. Sueet. De gramm. 22; Fest. 166. 8, 181. 18; Quint. i. 8. 15, &c.) are synonyms, signifying (a) the word which requires explanation; or (b) such a word (called lemma) together with the interpretation (interpretamentum); or (c) the interpretation alone (so first in the Aeneid. Heli.)

Latin, like Greek glossography, had its origin chiefly in the practical wants of students and teachers, of whose names we only know a few. No doubt even in classical times collections of glosses ("glossaries") were compiled, to which allusion seems to be made by Isidorus (Her. vii. 10. 13, περὶ τῶν γλωσσῶν σπαραγμῶν) and Verrius Festus (166. 6, "naucum ... glossamatorum ... scriptores fabae grani quod haeret in fabulo "), but it is not known to what extent Varro, for instance, used them, or retained their original forms. The scriptores glossamatorum were distinguished from the learned glossographers like Aurelius Opilius (cf. his Musee, ap. Sueet. De gramm. 6; Gel. i. 25. 17; Varro vii. 50. 65, 67, 70, 79, 106), Servius Clodius (Varro vii. 79. 106), Aelius Stilo, L. Ateius Philol., whose liber glossatorum Festus mentions (181. 18).

Verrius Flaccus and his epicontists, Festus and Paulus, have preserved many treasures of early glossographers who are now lost to us. Among them Isidore Aldeguinensis (d. 824), Erasistratus of Breslau phil. Abhandl., p. 88; Kriegshammer, Comm. phil. Ien. vii. 1. 74 sqq.), Aurelius Opilius, Ateius Philol., the treatise De dictionariis (in Musaeorum, peri et ubique terram sine controversia pro legibus celebrantur, ita ut nesis sit, non securum quas textus, Glossa Accursii contrarie). For similar testimonies see Bayle's Dictionnaire, s.v. "Accursius," and Rudorff, Röm. Rechts- geschichte, i. 538 (1857).
GLOSS, GLOSSARY

Cicero, according to Festus (339-2), wrote De verbis prisciis; Santra, De veris prisciis; Diss. Collat. Diurn. 3.772. of Latin glossaries the first four centuries of the Roman emperors few traces are left, if we except Verrius-Festus. Charis., 299, 30, speaks of glossae antiquitatis and 242. 10 of glossae vulgaretum, but it is not said whether this is a single glossary or whether they stand to the glossatometra literarias Latinas ordine composita, which were incorporated with the works of this grammarians according to the index in Keil, p. 6. Latin glosses occur in Ps.-Philoxenus, and Notitia (s.a. J. Ritschl, Palaeographie, 1887, 124. 1. Palatinus (Ritschl, Op. ii. 234 sq.)), and the bilingual glosses have been used by the later grammatician Martyrius; but of this period it is clear that there is no continuous system of names, who is sometimes called Lucatius Placidus, by confusion with the Stattius scholiast, with whom the glossae Placiadis have no connexion. All that we now of him tends to show that he lived in Nouria not in Gaul. Nouria and not Gaul seems to be the stronger, in the 6th century, from whence his glosses came to Spain, and were used by Isidore and the compiler of the Liber glossarum (see below). These glosses we know from (1) Codices Romani (15th and 16th century); (2) the Liber glossarum; (3) the Cod. Paris. nov. acquis. 1298 (aec. xl), a collection of glossaries, in which the Placidian glosses are kept separate from the others, and still retain traces of their original order (cf. the editions published by A. Mai, Class. aust. iii. 427-503, and Deuerling, 1875; Goetz, Corp. v. P.; K. Karl, De Placidis glossariis, Comm. Ion. vii. 2. 99, 103 sq.; Loewe, Glossarii, Thesaurus gloss. emend.); his collection includes glosses from Placidus Gellius. (Fabius Planciades) Fulgentius (c. A.D. 468-533) wrote Expositio sermonum antiquorum (ed. Rud. Helm, Lips. 1898; cf. Ws. w. y. Comm. ed. xiv. viii. 1. ed. Eucherius; varia, every one of the glosses in which the paraphrastic or the explanatory introduction begins (sometimes two or three) with an explanation giving quotations and names of authors. Next to him come the glosses Nonianae, which arise from the contents of the various paragraphs in Nomi Marcelli Sabin, (ii. 186; cf. ed. Gerths, 1886; The glosses in the glossa of the Latin text; these epitomized glosses were alphabetized and afterwards copied for other collections (see Goetz, Corp. v. 627 sqq., ed. v. Præd. xxxv.; Onions and Lindsay, Harvard Stud. ix. 67 sqq.; Lindsay, Novit. proef. xxi.). In a similar way arose the glossae Eucherii or glossae spirantalia secundum Eucherium epitomatum found in many MSS. (cf. K. Wottle, Sitz. Ber. Akad. Wien. cxv. 415 sqq.; = Zschr. philol. xvi.), a kind of glossary, which appears to be the basis of all later glossaries; it consists of the formulae spirantialia intelligentiæ of St Eucherius, bishop of Lyons, c. 434-450.

1. See also the Diferentiae, already known to Placidus and much used in the medieval glossaries; and the Synonyma Ciceronis, cf. Goetz, "De Liber glossarum," in Abhandl. d. philol. hist. Cl. d. staats. Gesellschaft d. Wiss., 1893, p. 215; id. in Berl. philol. Wochenschr., 1890, p. 195 sqq.; Beck, in Wochenschr., 297 sqq., and Sittels, ibid. p. 267; Archiv f. l. L. Lex. vii. 594; W. L. Mahne, (Leid. 1850, 1851); also various collections of scholia. By the side of the scholiast come the grammarians, as Chrestus, or (as an example) to that ascribed to him, and more especially, to the grammarians, as Caper (scriptores orthographici especially Caper and Beda), and Friscianus, the chief grammarians of the middle ages (cf. Goetz in Mélanges Bereau, vii. 1897, 253 sqq.).

During the 6th, 7th and 8th centuries glossography developed in various ways; old glossaries were worked up into new forms, or amalgamated with more recent ones. It ceased, moreover, to be exclusive. In Latin literature (i.e. in German, Anglo-Saxon and Romamonic dialects) the place of or were used side by side with earlier Latin ones. The origin and development of the late classic and medieval glossaries preserved to us can be traced with certainty. While reading the manuscript authors astronomical and mathematical authors, as well as Christian and profane writers, students and teachers, on meeting with any obscure or out-of-the-way words which they considered difficult to remember or to require elucidation, wrote above them, or in the margins, interpretations, these interpretations written above the line are called "interlinear," those written in the margins of the MSS. "marginal glosses." Again, some of the Bible portions of the Bible were often provided with literal translation of the whole or shorter written above the lines of the Latin version (interlinear versions).

Of such glossed MSS. or translated texts, photographs may be seen, in the Bibliothèque Nationale, Paris, in the collections of the Palatine Society, 1st ser. vol. ii. pl. 9 (Terentus MS. of 4th or 6th century, interlinear glosses) and 24 (Augustine's epistles, 6th or 7th century, marginal glosses); see further, plates 10, 12, 34, 35, 57, 59, 63, 73, 75, 80; vol. iii. plates 10, 24, 31, 49, 54, 58.

From these glossed or annotated MSS, and interlinear versions glosses have been extracted, and when the complete texts, together with these interpretations, were excerpted and collected in separate lists, in the order in which they appeared, one after the other, in the MSS., without any alphabetical arrangement, but with the names of the authors or the titles of the books whence they were taken, placed at the head of each separate collection or chapter. In this arrangement each article by itself is called a gloss; a collection of such glosses is more properly called a glossary, and if a part of the lemmata or glosses extracted from the Life of St Martin by Sulpicius Severus; chs. iv. v. and xxv. glosses from Rufinus; chs. vi. and xlv. from Gildas; chs. vii. to xlv. from books of the Bible (Paralipomenon; Proverbs, i. i. &c.); chs. xxvi. to xxviii. from Isidore, the Vita S. Antonii, Cassiodorus, St Jerome, Cassianus, Orosius, St Augustine, Placidus, Eucherius, St Gregory, the grammarians Donatus, Placidus, Placidus of Poitiers, the Commentaries of Ovid's Metam.; v. 657 from Apuleius, De Doctrina Socrae; cf. Landgraf, in Arch. inst. 174). By a second operation the glosses came to be arranged in alphabetical order according to the first letter of the lemma, but still retained in separate chapters under the names of authors or the titles of books. Of this second stage the Leiden Glossary contains such glosses also: ch. i. (Verba de Consonantibus et i. (Lemmatum de Regulis); see Goetz, Corp. v. 529 sqq. (from Tertullian. iv. 472 sqq.). The third operation collected all the accessible glosses in alphabetical order, in the first instance according to the first letters of the lemmata, and more especially, to the alphabetical arrangement of the books could no longer be preserved, and consequently the sources whence the glosses were excerpted became uncertain, especially if the grammatical forms of the lemmata had been _nominalized_.

A fourth arrangement collected the glosses according to the first two letters of the lemmata, as in the Corpus Glossary and in the still earlier Cod. Viol. (Goetz, Corp. iv. 471 sqq.), where even more attempts were made to arrange them according to the first three letters of the alphabet. A peculiar arrangement is seen in the Glossae offtin (Goetz, Corp. iv. 471 sqq.), where all words are alphabetized according to the initial letter of the word (a, b, c, &c.), and then further according to the first vowel in the word (a, b, c, u, i, o, u).

In these periods can be assigned to any of the above stages or arrangements. For instance, the first and second are both found in the Leiden Glossary, which dates from the end of the 8th century, whereas the Corpus Glossary, written in the beginning of the same century, represents already the fourth stage.

For the purpose of identification titles have of late years been given to the various nameless collections of glosses, derived partly from the lemmata of the glossaries, partly from later compilations of glosses, abstrusae; glossae abans major and minor; g. ab odisen; g. ab aetate; g. Abba Palet; g. o. a; g. Vergilianiæ; g. ominum (Goetz, Corp. v. 535; iv.); g. Sanguinenses (Warren, Transact. Amer. Acad. iv. 162). A chief landmark in glossography is represented by the Originis (Elymologise) of Isidore (d. 636), an encyclopedia in which he, like other lexicographers of later times, tried to reconcile the differences of the various dialects, and perhaps by himself from various sources. His principal source is Servius, then the fathers of the Church (Augustine, Jerome,
Glossary

Lactantius) and Donatus the grammarian. This tenth book was also copied and used separately, and mixed up with other works (cf. Loewe, Prodr. 167, 21). Isidore's "Diverseae" has also had a great deal of notice.

Next comes the Liber glossarum, chiefly compiled from Isidore, but although all articles are arranged alphabetically; its author lived in Spain c. A.D. 690-750; he has been called Anseleus, but not in any of the MS whence it is transmitted; hence, its name is suspected to be merely that of some owner of a copy of the book (cf. Goetz, "Der Liber Glossarum," in Abh. d. philol.-hist. Classe der k. bayer. akad. d. Wiss., 1903, p. 89 sqq.; cf. also ibid.). The first printed edition of 1470 is known (cf. Goetz in Berichte d. Verbandl. d. k. sächs. Gesellsch. d. Wiss., Leipzig, 1902).

The gloss MSS. of the 9th and 10th centuries are numerous, but a distinct group becomes visible when the secular and the Mahommedan treatises are distinguished, for which also glossaries were used. The chief material was (1) the Liber glossarum; (2) the Paulus glosses; (3) the glosses of Priscian; (4) the Priscian glosses of Syriac, Greek, and Hebrew-biblical collections of proper names (chiefly from Jerome). After these comes medieval material, as the "derivationes" which are found in many MSS. (cf. Goetz in Sitzungsber. sächs. Ges. d. Wiss., 1903, p. 136 sqq.; in Trüb. d. Arch. f. lat. Lex., viii., 264), containing quotations from Plautus, Ovid, Juvenal, Persius, Terence, occasionally from Priscian, Euthyches, and other grammarians, with etymological and grammatical words of the Osbern, Hugucio and Joannes of Janua.

Provençal material is the medico-botanical glossaries based on the earlier ones (see Goetz, Corp. iii.). The alphabetical order is followed by Latin, Greek, Latin, Hebrew and Arabic, interchange with English, French, and Italian forms. Of glossaries of this kind we have (1) the Glossaria alphata (published by S. Renzi in the 3rd vol. of the Carlo Magno, Naples, 1874, from works of the 11th and 12th centuries, but of the glosses occur already in earlier MSS.); (2) Synonyma Bartholomei, collected by John Mifflin, and arranged in order of the letters of the alphabet; (3) Oxon. i. i., 1822, Goetz, "Liber Glossarum" 116 sqq.); it seems to have used the same or some similar source as No. 1; (4) the compilations of Simon de Janua (Clavis sanantionum, end of 13th century), and of Mattheus the Cypriot (Pandectae medicinae, 14th century, ed. H. Stadler, Dioc. Longob. in Roman. Forsch. x. 3. 371; Steinmeier, Althochd. Gloss. i. 8).

Of biblical glossaries we have a large number, mostly mixed with glosses of other subjects, even of the Greek and Hebrew biblical proper names, and explanations of the text of the Vulgate in general, and the prolegomena of Hieronymus. So we have the Glossae veteris et novi testamenti (beginning "Prologus grace latino praeculi et praelungi sive praefatio") in numerous MSS. of the 9th to 12th centuries, mostly retaining the various books under separate headings (cf. Arevalo, Isl. vii. 407 sqq.; Loewe, Prodr. 141; Steinmeier i. 459; S. Berger, De compendii excogiti quibusdam medici aetatis mediae, Paris, 1879). Special mention should be made of Gull, Brito, who lived about 1250, and compiled a "Glossa" (beginning "difficiles studii passati") in a style gestate that was much used at the time, and appears to have been transcribed in several libraries, especially in French libraries. This Summa gave rise to the Mathematicus of Johannes Marcius, about 1300, of which we have editions printed in 1470, 1476, 1479, &c.

It may be mentioned such compilations as the Summa Heinrici; the work of Johannes de Garlandia, which he himself calls dictionarius (cf. Scheler in Jahrh. f. rom. u. engl. Philol. vii., 1587, p. 142 sqq.); and that of Alexander Neckam (ib. viii. 60 sqq.), cf. R. Ellis, in Annales Soc. Geog. Paris, 1898, and the long description of the library of the chartusian. The Brevislogus drew its chief material from Paulus, Hugucio, Brito, &c. (K. Hamann, Mittel. aus dem Brevislogus Bethamienius, Hamburg, 1879, ed. and annotated, 1882; also the Vocabularius Ex quo; the various Gemmae; Vocabularium rerum (cf. Dienesbach, Glossar. Latino-Germanicum). After the revival of learning, J. Scaliger (1540-1609) was the first to import to glossaries that importance which they deserve (cf. Goetz, in Sitzungsber. sächs. Ges. d. Wiss., 1888, p. 219 sqq.), and in his edition of Ps.-Philemon, which enabled Q. G. Goetz, in the latter case, to publish the "Glossae alterae," and also Scaliger also published the edition of "De grammatis," and left behind a collection of glosses known as glossae Isidori (Goetz, Corp. v. p. 589 sqq.; id. in Sitzungsber. sächs. Ges., 1888, p. 224 sqq.; Loewe, Prodr. 23 sqq.), which occurs also in old glossaries, clearly in reference to the tenth book of the Etymologiae.

The study of glosses spread through the publication of 1575, of the bilingual glossaries by H. Stepanius (Estienne), containing the "Glossae veteris et novi testamenti," which is also the Etymologiae (which is a recension of the Ps.-Dositheana (republished Goetz, Corp. iii. 438-474), and the Glossae Stephani, excerpted from a collection of the Hermenaeus, ed. ib. ib. p. 747.)

In 1600 Bonav. Vulcanus republished the "Glossae alterae," and added (1) the glossae Isidori, which now appear for the first time; (2) the "Onomasticum." Note and castigations, derived from Scaliger (fasc. viii., 182). In 1665 Carus and Peter Labbaeus published the "True and Scaliger, another collector of glossaries, republished, in 1679, by Du Cange, after which the 17th and 18th centuries produced no

1 Anglo-Saxon scholars ascribe this date to the MS. on account of certain archaisms in its Anglo-Saxon words.
GLOUCESTER, EARLS AND DUKES OF.

The English earldom of Gloucester was held by several members of the royal family, including Robert, a natural son of Henry I., and John, afterwards king, and others, until 1218, when Gilbert de Clare was recognized as earl of Gloucester. It remained in the family of Clare (6e.) until 1314, when another Earl Gilbert was killed at Bannockburn; and after this date it was claimed by various relatives of the Clares, among them by the younger Hugh le Despenser (d. 1326) and by Hugh Audley (d. 1347), both of whom had married sisters of Earl Gilbert. In 1397 Thomas le Despenser (1373-1400), a descendant of the Clares, was created earl of Gloucester; but in 1399 he was degraded from his earldom and in January 1400 he was beheaded.

The dukedom dates from 1385, when Thomas of Woodstock, a younger son of Edward III., was created duke of Gloucester, but his honours were forfeited when he was found guilty of treason in 1397. The next holder of the title was Humphrey, a son of Henry IV., who was created duke of Gloucester in 1414. He died without sons in 1447, and in 1461 the title was revived in favour of Richard, brother of Edward IV., who became king as Richard III. in 1483.

In 1659 Henry (1630-1660), a brother of Charles II., was formally created duke of Gloucester, a title which he had borne since infancy. This prince, sharing the exile of the Stuarts, had incurred his mother, Queen Henrietta Maria, by his firm adherence to the Protestant religion, and had fought among the Spaniards at Dunkirk in 1658. Having returned to England with Charles, he was divorced in 1660 and was created Duke of Gloucester in 1666. The next duke was William (1689-1700), son of the princess Anne, who, after his mother, the heir to the English throne, and who was declared duke of Gloucester by his uncle, William III., in 1689, but no patent for this creation was ever passed. William died on the 30th of July 1710, and again the title became extinct.

Frederick Louis, the eldest son of George II., was known for sometime as duke of Gloucester, but when he was raised to the peerage in 1726 it was as duke of Edinburgh only. In 1764 Frederick's third son, William Henry (1743-1803), was created duke of Gloucester and Edinburgh by his brother, George III. This duke's secret marriage with Maria (d. 1807), an illegitimate daughter of Sir Edward Walpole and widow of James, 2nd Earl Waldegrave, in 1766, greatly incensed his royal relatives and led to his banishment from court. Gloucester died on the 25th of August 1805, leaving an only son, William Frederick (1776-1834), who now became duke of Gloucester and Edinburgh. This William Frederick married, in 1800, Elizabeth who served with the British army in Flanders, married his cousin Mary (1776-1837), a daughter of George III. He died on the 30th of November 1834, leaving no children.
GLOUCESTER, EARLS AND DUKES OF

widow, the last survivor of the family of George III., died on the 30th of April 1857.

GLOUCESTER, GILBERT DE CLARE, EARL OF (1243-1293), was a son of Richard de Clare, 7th earl of Gloucester and 8th earl of Clare, and was born at Christchurch, Hampshire, on the 2nd of September 1243. Having married Alice of Angoulême, half-sister of king Henry III., he became earl of Gloucester and Clare on his father's death in July 1262, and almost at once joined the baronial party led by Simon de Montfort, earl of Leicester. With Simon Gloucester was at the battle of Lewes in May 1264, when the king himself surrendered to him, and after this victory he was one of the seven persons selected to nominate a council. Soon, however, he quarrelled with Leicester. Leaving London for his lands on the Welsh border he met Prince Edward, afterwards king Edward I., at Ludlow, just after his escape from captivity, and by his skill contributed largely to the prince's victory at Evesham in August 1265. But this alliance was as transitory as the one with Leicester. Gloucester took up the cudgels on behalf of the barons who had surrendered at Kenilworth in November and December 1266, and after putting his demands before the king, secured possession of London. This happened in April 1267, but the earl quickly made his peace with Henry III. and with Prince Edward, and, having evaded an obligation to go on the Crusade, he helped to secure the peaceful accession of Edward I. to the throne in 1272. Gloucester then passed several years in fighting in Wales, or on the Welsh border; in 1289 when the barons were asked for a subsidy he replied on their behalf that they would grant nothing until they saw the king in person (nisi prius personaliter rideret in Anglia, faciam regi), and in 1291 he was fined and imprisoned on account of his violent quarrel with Humphrey de Bohun, earl of Hereford. Having divorced his wife Alice, he married in 1290 Edward's daughter Joan, or Johanna (d. 1307). Earl Gilbert, who is sometimes called the "Red," died at Monmouth on the 7th of December 1295, leaving in addition to three daughters a son, Gilbert, earl of Gloucester and Clare, who was killed at Bannockburn.

See C. Bémont, Simon de Montfort, comte de Leicester (1884), and G. W. Prothero, Simon de Montfort (1877).

GLOUCESTER, HUMPHREY, DUKE OF (1392-1447), fourth son of Henry IV. by Mary de Bohun, was born in 1391. He was knighted at his father's coronation on the 11th of October 1399, and created duke of Gloucester by Henry V. at Leicester on the 16th of May 1414. He served in the war next year, and was wounded at Agincourt, where he owed his life to his brother's valour. In April 1416 Humphrey received the emperor Sigismund at Dover and, according to a 16th-century story, did not let him land till he had discharged all title to imperial and feudal England. In the second invasion of France Humphrey commanded the force which during 1417 fortified the Cotentin and captured Cherbourg. Afterwards he joined the main army before Rouen, and took part in subsequent campaigns till January 1420. He then went home to replace Bedford as regent in England, and held office till Henry's own return in February 1421. He was again regent for his brother from May to September 1422.

Henry V. measured Humphrey's capacity, and by his will named him merely deputy for Bedford in England. Humphrey at once occupied the full position of regent, but the parliament and council allowed him only the title of protector during Bedford's absence, with limited powers. His lack of discretion soon justified this caution. In the autumn of 1422 he married Jacqueline of Bavaria, heiress of Holland, to whose lands Philip of Burgundy had claims. Bedford, in the interest of so important an ally, endeavoured vainly to restrain his brother. Finally in October 1424 Humphrey took up arms in his wife's behalf, but after a short campaign in Hainault went home, and left Jacqueline to be overwhelmed by Burgundy. Returning to England in April 1425 he soon enraged himself in a quarrel with the council and his uncle Henry Beaumont stirred up a tumult in London. Open war was averted only by Beaumont's influence, and Bedford's hurried return. Humphrey had charged his uncle with disloyalty to the late and present kings. With some difficulty Bedford effected a formal reconciliation at Leicester in March 1426, and forced Humphrey to accept Beaufort's disavowal. When Bedford left England next year Humphrey renewed his intrigues. But one complication was removed by the annulling in 1428 of his marriage with Jacqueline. His open adultery with his mistress, Eleanor Cobham, also made him unpopular. To check his indiscretion the council, in November 1429, had the king crowned, and so put an end to Humphrey's protectorate. However, when Henry VI. was soon afterwards taken to be crowned in France, Humphrey was made lieutenant and warden of the kingdom, and thus ruled England for nearly two years. His jealousy of Bedford and Beaufort still continued, and when the former died in 1435 there was no one to whom he would defer. The defection of Burgundy roused English feeling, and Humphrey won popularity as leader of the war party. In 1436 he commanded in a short invasion of Flanders. But he had no real power, and his political importance lay in his persistent opposition to Beaufort and the councillors of his party. In 1439 he renewed his charges against his uncle without effect. His position was further damaged by his connexion with Eleanor Cobham, whom he had now married. In 1441 Eleanor was charged with practising sorcery against the king, and Humphrey had to submit to see her condemned, and her accomplices executed. Nevertheless, he continued his political opposition, and endeavoured to thwart Suffolk, who was now taking Beaufort's place in the council, by opposing the king's marriage to Margaret of Anjou. Under Suffolk's influence Henry VI. grew to distrust his uncle altogether. The crisis came in the parliament of Bury St Edmunds in February 1447. Immediately on his arrival there Humphrey was arrested, and four days later, on the 23rd of February, he died. Rumour attributed his death to foul play. But his health had been long undermined by excesses, and his end was probably hastened by the shock of his arrest.

Humphrey was buried at St Albans Abbey, in a fine tomb, which still exists. He was ambitious and self-seeking, but unstable and unprincipled, and, lacking the fine qualities of his brothers, excelled neither in war nor in peace. Still he was a cultured and courtly prince, who could win popularity. He was long remembered as the good Duke Humphrey, and in his lifetime was a liberal patron of letters. He had been a great collector of books, many of which he presented to the university of Oxford. He contributed also to the building of the Divinity School, and of the room still called Duke Humphrey's library. His books were dispersed at the Reformation and only three volumes of his donation now remain in the Bodleian library. Titus Livius, an Italian in Humphrey's service, wrote a life of Henry V. at his patron's bidding. Other Italian scholars, and by his patronage, were encouraged by his patronage. English men of letters who befriended Reginald Pecock, Wethamstede of St Albans, Capgrave the historian, Lydgate, and Gilbert Kymer, who was his physician and chancellor of Oxford university. A popular error found Humphrey a fictitious tomb in St Paul's Cathedral. The adjoining aisle, called Duke Humphrey's Walk, was frequently befogged and needy adventurers. Hence the 16th-century proverb "to dine with Duke Humphrey," used of those who loitered there dinnerless.

GLOUCESTER, RICHARD DE CLARE, EARL OF (1222-1263), was a son of Gilbert de Clare, 6th earl of Gloucester and 7th earl of Clare, and was born on the 4th of August 1222, succeeding
to his father's earldoms on the death of the latter in October 1230. His first wife was Margaret, daughter of Hubert de Burgh, and after her death in 1237 he married Maud, daughter of John de Lacy, earl of Lincoln, and passed his early years in tournaments and pilgrimages, taking for a time a secondary and undecided part in politics. He refused to help Henry III. on the French expedition of 1250, but was afterwards with the king at Paris; then he went on a diplomatic errand to Scotland, and was sent to Germany to work among the princes for the election of his stepfather, Richard, earl of Cornwall, as king of the Romans. About 1258 Gloucester took up his position as a leader of the barons in their resistance to the king, and he was prominent during the proceedings which followed the Mad Parliament at Oxford in 1258, but in 1259, however, he was one of Montfort, earl of Leicester; the dispute, begun in England, was renewed in France and he was again in the confidence and company of the king. This attitude, too, was only temporary, and in 1261 Gloucester and Leicester were again working in concord. The earl died at his residence near Canterbury on the 15th of July 1262. A large landholder like his son and successor, Gilbert, Gloucester was the most powerful English baron of his time; he was avaricious and extravagant, but educated and able. He left several children in addition to Earl Gilbert.

GLoucester, Robert, Earl of (d. 1142), was a natural son of Henry L of England. He was born, before his father's accession, at Caen in Normandy; but the exact date of his birth, and his mother's name are unknown. He received from his father the hand of a wealthy heiress, Mabel of Gloucester, daughter of Robert Fitz Hamon, and with her the lordships of Gloucester and Glamorgan. About 1121 the earldom of Gloucester was created for his benefit. His rank and territorial influence made him the natural leader of the western baronage. Hence, at his father's death, he was sedulously courted by the rival parties of his half-sister the empress Matilda and of Stephen. After some hesitation he declared for the latter, but tendered his homage upon strict conditions, the breach of which should be held to invalidate the contract. Robert afterwards alleged that he had merely feigned submission to Stephen with the object of secretly furthering his half-sister's cause among the English barons. The truth appears to be that he was mortified at finding himself excluded from the inner councils of the king, and so resolved to sell his services elsewhere. Robert left England for Normandy in 1137, renewed his relations with the Angevin part, and formed his plans. When he returned to England in the following year, he raised the standard of rebellion in his own earldom with such success that the greater part of western England and the south Welsh marches were soon in the possession of the empress. By the battle of Lincoln (Feb. 2, 1141), in which Stephen was taken prisoner, the earl made good Matilda's claim to the whole kingdom. He accompanied her triumphal progress to Winchester and London; but was unable to moderate the arrogance of her behaviour. Consequently she was soon expelled from London and deserted by the bishop Henry of Winchester who, as legate, controlled the policy of the English church. With Matilda the earl besieged the legate at Winchester, but was forced by the royalists to beat a hasty retreat, and in covering Matilda's flight fell into the hands of the pursuers. So great was his importance that his party purchased his freedom by the release of Stephen. The earl renewed the struggle for the crown and continued it until his death (Oct. 31, 1147); but the personal unpopularity of Matilda, and the estrangement of the Church from her cause, made his efforts vainly. His loyalty to a lost cause must be allowed to weigh in the scale against his earlier double-dealing. But he hardly deserves the extravagant praise which is lavished upon him by William of Malmesbury. The sympathies of the chronicler are too obviously influenced by the earl's munificence towards literary men.

See the Historia novella by William of Malmesbury (Rolls edition); the Historia Anglorum by Henry of Huntingdon (Rolls edition); J. H. Round's Geoffrey de Mandeville (1892); and O. Rössler's Kaisern Mathilde (Berlin, 1897). (H. W. C. D.)

GLoucester, Thomas of Woodstock, Duke of (1355–1397), seventh and youngest son of the English king Edward III., was born at Woodstock on the 7th of January 1355. Having married Eleanor (d. 1399), daughter and co-heiress of Humphrey de Bohun, earl of Hereford, Essex and Northampton (d. 1373), Thomas obtained the office of constable of England, a position previously held by the Bohuns, and was made earl of Buckingham by his nephew, Richard II., at the coronation in July 1377. He took part in defending the English coasts against the attacks of the French and Castilians, after which he led an army through northern and central France, and besieged Nantes, which town, however, he failed to take.

Returning to England early in 1381, Buckingham found that his brother John of Gaunt, Duke of Lancaster, had married his wife's sister, Margaret, to his own son, Henry, afterwards King Henry IV. The relations between the brothers, hitherto somewhat strained, were not improved by this proceeding, as Thomas, doubtless, was hoping to retain possession of Mary's estates. Having taken some part in crushing the rising of the peasants in 1381, Buckingham became more friendly with Lancaster; and while marching with the king into Scotland in 1383 was created duke of Gloucester, a mark of favour, however, which did not prevent him from taking up an attitude of hostility towards his brother. On the death (May 1384) of his father, Richard II., Gloucester placed himself at the head of the party which disliked the royal advisers, Michael de la Pole, earl of Suffolk and Robert de Vere, earl of Oxford, whose recent elevation to the dignity of duke of Ireland had aroused profound discontent. The moment was propitious for interference, and supported by those who were indignant at the extravagance and incompetence, real or alleged, of the king, Gloucester was soon in a position of authority. He forced on the dismissal and impeachment of Suffolk; was a member of the commission appointed in 1386 to reform the kingdom and the royal household; and took up arms when Richard began proceedings against the commissioners. Having defeated Vere at Radcot in December 1387 the duke and his associates entered London to find the king powerless in their hands. Gloucester, who had previously threatened his uncle with deposition, was only restrained from taking this extreme step by the influence of his colleagues; but, as the leader of the "lords appellant" in the "Merciless Parliament," which met in February 1388 and was packed with his supporters, he took a savage revenge upon his enemies, while not neglecting to add to the disgrace of the king.

It was not seriously punished when Richard regained his power in May 1386, but he remained in the background, although employed occasionally on public business, and accompanying the king to Ireland in 1394. In 1396, however, uncle and nephew were again at variance. Gloucester disliked the peace with France and Richard's second marriage with Isabella, daughter of King Charles VI.; other causes of difference were not wanting, and it has been asserted that the duke was plotting to seize the king. At all events Richard decided to arrest him. By refusing an invitation to dinner the duke frustrated the first attempt, but on the 11th of July 1397 he was arrested by the king himself at his residence, Pleshey castle in Essex. He was taken at once to Calais, and it is probable that he was murdered by order of the king on the 9th of September following. The facts seem to be as follows. At the beginning of September it was reported that he was dead. The rumour, probably a deliberate one, was false, and about the same time a justice, Sir William Rickhill (d. 1407), was sent to Calais with instructions dated the 17th of August to obtain a confession from Gloucester. On the 8th of September the duke confessed that he had been guilty of treason, and his death immediately followed this avowal. Unwilling to meet his parliament so soon after his uncle's death, Richard's purpose was doubtless to antedate this occurrence, and to foster the impression that the duke had died from natural causes in August. When parliament met in September he was declared guilty of treason and his estates forfeited. Gloucester had one son, Humphrey (c. 1351–1399), who died unmarried, and four daughters, the most notable of whom was Anne (c. 1380–1438), who was
successively the wife of Gloucester, 3rd earl of Stafford, Edmund, 5th earl of Stafford, and William Bourchier, count of Eu. Gloucester is supposed to have written L'Ordonnance d'Angleterre pour le camp à l'entrée, ou gaige de battle.

**GLOUCESTER** (abbreviated as pronounced Glo'ster), a city, county of a city, municipal and parliamentary borough and port, and the county town of Gloucestershire, England, on the left (east) bank of the river Severn, 114 m. W.N.W. of London. Pop. (1901) 47,955. It is served by the Great Western railway and the west-and-north branch of the Midland railway; while the Berkeley Ship Canal runs S.W. to Sharpness Docks in the Severn estuary (161 m).

Gloucester is situated on a gentle eminence overlooking the Severn and sheltered by the Cotteswolds on the east, while the Malverns and the hills of the Forest of Dean rise prominently to the west and north-west.

The cathedral, in the north of the city, near the river, originates in the foundation of an abbey of St Peter in 681; the foundations of the present church having been laid by Abbot Serlo (1072-1104); and Walter Froucester (d. 1412) its historian, became its first abbot in 1381. Until 1541, Gloucester lay in the see of Worcester, but the separate see was then constituted, with John Wakeman, last abbot of Tewkesbury, for its first bishop. The diocese covers the greater part of Gloucestershire, with small parts of Herefordshire and Worcestershire. The cathedral may be succinctly described as consisting of a Norman nucleus, with additions in every style of Gothic architecture. It is 440 ft. long, and 144 ft. broad, with a beautiful central tower of the 13th century rising to the height of 225 ft. and topped by four graceful pinnacles. The nave is massive Norman with Early English roof; the crypt also, under the choir, aisles and chapels, is Norman, as is the chapter-house. The crypt is one of the four apsidal cathedral crypts in England, the others being at Worcester, Winchester and Canterbury. The south porch is Perpendicular, with fan-tracery roof, as also is the north transept, the south being transitional Decorated. The choir has Perpendicular tower over Norman work, with an apsidal chapel on each side. The choir-vaulting is particularly rich, and the modern scheme of colouring is ingenious. The splendid late Decorated east window is partly filled with ancient glass. Between the apsidal chapels is a cross Lady chapel, and north of the nave are the cloisters, with very early example of fan-tracery, the carols or stalls for the monks' study and writing lying to the south. The finest monument is the canopied shrine of Edward II, who was brought hither from Berkeley. By the visits of pilgrims to this the building and sanctuary were enriched. In a side-chapel, too, is a monument in coloured bog oak of Robert Cuthrose, a great benefactor to the abbey, the eldest son of the Conqueror, who was interred there; and those of Bishop Warburton and Dr Edward Jenner are also worthy of special mention. A musical festival (the Festival of the Three Choirs) is held annually in this cathedral and those of Worcester and Hereford in turn. Between 1873 and 1890 and in 1897 the cathedral was extensively restored, principally by Sir Gilbert Scott. Attached to the deanery is the Norman prior's chapel. In St Mary's Square outside the Abbey gate, Bishop Hooper suffered martyrdom under Queen Mary in 1555.

Quaint gabled and timbered houses preserve the ancient aspect of the city. At the point of intersection of the four principal streets stood the Tolsey or town hall, replaced by a modern building in 1894. None of the old public buildings, in fact, is left, but the New Inn in Northgate Street is a beautiful timbered house, strong and massive, with external galleries and courtyards, built in 1450 for the pilgrims to Edward II's shrine, by Abbot Sibbroke, a traditional subterranean passage leading thence to the cathedral. The timber is principally chestnut. There are a large number of churches and dissenting chapels, and it may have been the old proverb, "as sure as God's in Gloucester," which prompted Oliver Cromwell to declare that the city had "more churches than godliness." Of the churches four are of special interest: St Mary de Lode, with a Norman tower and chancel, and a monument of Bishop Hooper, on the site of a Roman temple which became the first Christian church in Britain; St Mary de Crypt, a cruciform structure of the 12th century, with later additions and a beautiful and lofty tower; the church of St Michael, said to have been connected with the ancient abbey of St Peter; and St Nicholas church, originally of Norman erection, becoming a tower and other portions of later date. In the neighbourhood of St Mary de Crypt are slight remains of Greyfriars and Blackfriars monasteries, and also of the city wall. Early vaulted cellars remain under the Fleece and Saracen's Head inns.

There are three endowed schools: the College school, refounded by Henry VIII. as part of the cathedral establishment; the school of St Mary de Crypt, founded by Dame Joan Cooke in the same reign; and Sir Thomas Rich's Blue Coat hospital for 34 boys (1666). At the Crypt school the famous preacher George Thallam (1742-1779) was educated, and it held its first sermon in the church. The first Sunday school was held in Gloucester, being originated by Robert Raikes, in 1780.

The noteworthy modern buildings include the school of art and science, the county gaol (on the site of a Saxon and Norman castle), the Shire Hall and the Whitefield memorial church. A park in the south of the city contains a spa, a chalybeate spring having been discovered in 1814. West of this, across the canal, are the remains (a gateway and some walls) of Lanthony Priory, a cell of the mother abbey in the vale of Ewyas, Monmouthshire, which in the reign of Edward IV. became the secondary establishment.

Gloucester possesses match works, foundries, marble and slate works, saw-mills, chemical works, rope works, flour-mills, manufactories of railway wagons, engines and agricultural implements, and boat and ship-building yards. Gloucester was declared a port in 1882. The Berkeley canal was opened in 1827. The Gloucester canal-harbour and that at Sharpness on the Severn are managed by a board. Principal imports are timber and grain; and exports, coal, salt, iron and bricks. The salmon and lamprey fisheries in the Severn are valuable. The tidal bore in the river attains its extreme height just below the city, and sometimes surmounts the weir in the western branch of the river, affecting the stream up to Tewkesbury lock. The parliamentary borough returns one member. The city is governed by a mayor, 10 aldermen and 30 councillors. Area, 2315 acres.

**History.**—The traditional existence of a British settlement at Gloucester (Gwaw, Gloewecastre, Glocestre) is not confirmed by any direct evidence, but Gloucester was the Roman municipality or colonia of Glocestri, founded by Nerva (A.D. 68-78). Parts of the walls can be traced, and many remains and coins have been found, though inscriptions (as is frequently the case in Britain) are somewhat scarce. Its situation on a navigable river, and the foundation in 681 of the abbey of St Peter by Æthelred favoured the growth of the town; and before the Conquest Gloucester was a borough governed by a portreeve, with a castle which was frequently a royal residence, and a mint. The first overlord, Earl Godwine, was succeeded nearly a century later by Robert, earl of Gloucester. Henry II. granted the first charter in 1155 which gave the burgesses the same liberties as the citizens of London and Winchester, and a second charter of Henry II. gave them freedom of passage on the Severn. The first charter was confirmed in 1164 by Richard I. The privileges of the borough were greatly extended by the charter of John (1200) which gave freedom from toll throughout the kingdom and from pleading outside the borough. Subsequent charters were numerous. Gloucester was incorporated by Richard III. in 1483, the town being made a county in itself. This charter was confirmed in 1486 and 1510, and other charters of incorporation were received by Gloucester from Elizabeth in 1560, James I.
GLOUCESTER, U.S.A.—GLOUCESTERSHIRE

in 1604, Charles I. in 1626 and Charles II. in 1672. The chartered port of Gloucester dates from 1580. Gloucester returned two members to parliament from 1275 to 1885, since when it has been represented by one member. A seven days' fair from the 24th of June was granted by Edward I. in 1302, and James I. licensed fairs on the 25th of March and the 17th of November, and fairs under these grants are still held on the first Saturday in April and July and the last Saturday in November. The fair now held on the 28th of September was granted to the abbey of St Peter in 1227. A market on Wednesday existed in the reign of John, was confirmed by charter in 1227 and is still held. The iron trade of Gloucester dates from before the Conquest, tanning was carried on before the reign of Richard III., pin-making and bell-founding were introduced in the 16th, and the long-existing coal trade became important in the 18th century. The cloth trade flourished from the 12th to the 16th century. The sea-borne trade in corn and wine existed before the reign of Richard I.

See W. H. Stevenson, Records of the Corporation of Gloucester (Gloucester, 1893); Victoria County History, Gloucestershire.

GLOUCESTER, a city and port of entry of Essex county, Massachusetts, U.S.A., beautifully situated on Cape Ann. Pop. (1890) 24,651; (1900) 26,121, of whom 8768 were foreign-born, including 4388 English Canadians, 800 French Canadians, 665 Irish, 653 Finns and 504 Portuguese; (1910 census) 24,398. Area, 53-6 sq. m. It is served by the Boston & Maine railway and by a steamboat line to Boston. The surface is sterile, naked and rugged, with bold, rocky ledges, and a most picturesque shore, the beauties of which have made it a favourite summer resort, much frequented by artists. Included within the city borders are several villages, of which the principal one, also known as Gloucester, has a deep and commodious harbour. Among the other villages, all summer resorts, are Annisquam, Bay View and Magnolia (so called from the Magnolia Grandiflora, which grows wild there, this being probably its most northerly habitat); near Magnolia are Rale's Chasm (60 ft. deep and 6-10 ft. wide) and Norman's Woe, the scene of the wreck of the "Hesperus" (which has only tradition as a basis), celebrated in Longfellow's poem. There is some slight general commerce—in 1909 the imports were valued at $1,540,998; the exports at $785,3 but the principal business is fishing, and has been since early colonial days. The pursuit of cod, mackerel, herring and halibut fills up, with a winter coasting trade, the round of the year. In this industry Gloucester is the most important place in the United States; and is, indeed, one of the greatest fishing ports of the world. Most of the adult males are engaged in it. The "catch" was valued in 1895 at $3,212,985 and in 1905 at $3,377,339. The organization of the industry has undergone many transformations, but a notable feature is the general practice—especially this, modern methods have necessitated larger vessels and more costly gear, and correspondingly greater capital—of profit-sharing; all the crew entering on that basis and not independently. There are some manufactures, chiefly connected with the fisheries. The total factory product in 1905 was valued at $6,920,984, of which the canning and preserving of fish represented $4,608,571, and glue represented $752,063. An industry of considerable importance is the quarrying of the beautiful, dark Cape Ann granite that underlies the city and all the environs.

Gloucester harbour was probably noted by Champlain (as La Beaupto), and a temporary settlement was made by English fishermen sent out by the Dorchester Company of "merchant adventurers" in 1623—1625; some of these settlers returned to England in 1625, and others, with Roger Conant, the governor, removed to what is now Salem. Permanent settlement ante- dated 1639 at least, and in 1642 the township was incorporated. From Gosnold's voyages onward the extraordinary abundance of cod about Cape Ann was well known, and though the first settlers characteristically enough tried to live by farming, they speedily became perfec the sea-faring folk. The active pursuit of fishing as an industry may be dated as beginning about 1700, for then began voyages beyond Cape Sable. Voyages to the Grand Banks began about 1741. Mackerel was a relatively important catch until about 1821, and since then has been an important but unstable return; halibut fishing has been vigorously pursued since about 1836 and herring since about 1856. At the opening of the War of Independence Gloucester, whose fisheries then employed about 600 men, was second to Marblehead as a fishing-port. The war destroyed the fisheries, which steadily declined, reaching their lowest ebb from 1820 to 1840. Meanwhile foreign commerce had greatly expanded. The cod trade had supported in the 18th century an extensive trade with Bilbao, Lisbon and the West Indies, and though changed in nature with the decline of the Bank fisheries after the War of Independence, it continued large through the first quarter of the 19th century. Throughout more than half of the same century also Gloucester carried on a varied and valuable trade with Suriname, hake being the chief article of export and molasses and sugar the principal imports. "India Square" remains, a memento of a bygone day. About 1850 the fisheries revived, especially after 1860, under the influence of better prices, improved methods and the discovery of new grounds, becoming again the chief economic interest; and since that time the village of Gloucester has changed from a picturesque hamlet to a fairly modern, though still quaint and somewhat foreign, settlement. Gasoline boats were introduced in 1900, ship-building is another industry of the past. The first schooner was launched at Gloucester in 1715. From 1830 to 1905, 776 vessels and 5,242 lives were lost in the fisheries; but the loss of life has been greatly reduced by the use of better vessels and by improved methods of fishing. Gloucester became a city in 1874.

Gloucester life has been celebrated in many books; among others in Elizabeth Stuart Phelps-Ward's Singular Life and Old Maid's Paradise, in Rudyard Kipling's Captains Courageous, and in James B. F. Andrews's The Out of Gloucester (1902), The Deep Sea's Toll (1908), and The Crested Seagull (1909).

See J. J. Babson, History of the Town of Gloucester (Gloucester, 1860; with Notes and Additions, on genealogy, 1876, 1891); and J. K. Pringle, History of the Town and City of Gloucester (Gloucester, 1892).

GLOUCESTER CITY, a city of Camden county, New Jersey, U.S.A., on the Delaware river, opposite Philadelphia. Pop. (1850) 6,564; (1900) 6,840, of whom 1094 were foreign-born; (1905) 8,055; (1910) 9,462. The city is served by the West Jersey & Seashore and the Atlantic City railways, and by ferry to Philadelphia, of which it is a residential suburb. Among its manufactures are indigent gas-burners, rugs, cotton yarns, boats and drills. The municipality owns and operates the water works. It was near the site of Gloucester City, that the Dutch in 1623 planted the short-lived colony of Fort Nassau, the first European settlement on the Delaware river, but it was not until after the arrival of English Quakers on the Delaware, in 1677, that a permanent settlement, at first called Axwamus, was established on the site of the present city. This was surveyed and laid out as a town in 1689. During the War of Independence the place was frequently occupied by troops, and a number of skirmishes were fought in its vicinity. The most noted of these was a successful attack upon a detachment of Hessians on the 25th of November 1777 by American troops under the command of General Lafayette. In 1865 Gloucester City was chartered as a city. In Camden county there is a township named Gloucester (pop. in 1905, 2300), incorporated in 1798, and originally including the present township of Clementon and parts of the present townships of Waterford, Union and Winslow.

GLOUCESTERSHIRE, a county of the west midlands of England, bounded N. by Worcestershire, N.E. by Warwickshire, E. by Oxfordshire, S.E. by Berkshire and Wiltshire, S. by Somerset, and W. by Monmouth. Length and breadth are 38 miles and 24 miles. The outline is very irregular, but three physical divisions are well marked—the hills, the vale and the forest. (1) The first (the eastern part of the county) lies among the
uplands of the Cotswold Hills (pt.), whose westward face is a line of breakings of an average elevation of 700 ft., but exceeding 300 ft. at some points. This line bisects the county from S.W. to N.E. The watershed between the Thames and Severn valleys lies close to it, so that Gloucestershire includes Thames Head itself, in the south-east near Cirencester, and most of the upper feeders of the Thames which join the main stream, from narrow and picturesque valleys on the north. (2) The western Cotswold line overlooks a rich valley, that of the lower Severn, usually spoken of as "The Vale," or, in two divisions, the vale of Gloucestershire and the vale of Berkeley. This great river receives three famous tributaries during its course through Gloucestershire. Near Tewkesbury, on the northern border, the Avon joins it on the left and forms the county boundary for 4 m. This is the river known variously as the Upper, Worcestershire, Warwickshire, Stratford or Shakespeare's Avon, which descends a lovely pastoral valley through the counties named. It is to be distinguished from the Bristol Avon, which rises as an eastward flowing stream of the Cotswolds, in the south-east of Gloucestershire, sweeps southward and westward through Wiltshire, pierces the hills through a narrow valley which becomes a wooded gorge where the Clifton suspension bridge crosses it below Bristol, and enters the Severn estuary at Avonmouth. For 17 m. from its mouth it forms the boundary between Gloucestershire and Somersetshire, and for 8 m. it is one of the most important commercial waterways in the kingdom, connecting the port of Bristol with the sea. The third great tributary of the Severn is the Wye. From its mouth in the estuary, 8 m. N. of that of the Bristol Avon, it flows northward, and above this, over two short reaches of its beautiful winding course, it is again the boundary. (3) Between the Wye and the Severn lies a beautiful and historic tract, the forest of Dean, which, unlike the majority of English forests, maintains its ancient character. Gloucestershire has thus a share in the courses of five of the most famous English rivers, and covers two of the most interesting physical districts in the country. The minor rivers of the county are never long. The vale is at no point within the county wider than 24 m., and so does not permit the formation of any considerable tributary to the Severn from the Dean Hills on the one hand or the Cotswolds on the other. The Leaden rises east of Hereford, forms part of the north-western boundary, and joins the Severn near Gloucester, watering the vale of Gloucester, the northern part of the vale. In the southern part, the vale of Berkeley, the Stroudwater traverses a narrow, picturesque and populous valley, and the Little Avon flows past the town of Berkeley, joining the Severn estuary on the left. The Frome runs southward to the Bristol Avon at Bristol. The principal northern feeder of the Severn is the Brecon, or the River Usk (properly the headwater of the main river) rising in the Seven Springs, in the hills above Cheltenham, and forming the southern county boundary near its junction with the Thames at Cricklade; the Coln, a noteworthy trout-stream, joining above Lechlade, and the Lech (forming part of the eastern county boundary) joining below the same town; while from the east of the county there pass into Oxfordshire the Windrush and the Evenlode, much larger streams, rising among the bare uplands of the northern Cotswolds.

Geology.—No county in England has a greater variety of geological formations. The pre-Cambrian is represented by the gneissic rocks at the head of the Severn, the Malvern Hills, and at Darley, near Matlock. At Darley, Charfield and Woodford is a patch of greenstone, the cause of the upheaval of the Upper Silurian basin of Tiverton, in which these rocks are seen. The latter basin lies near the head of the Severn. In the Cotswold district a piece of the lower Carboniferous strata is seen in the locality of Berkeley. Carboniferous limestone is seen in the Avon country (forming the Old Red Sandstone), and is seen in upper cases, thin bands of sandstone which, as Downton sandstones and Ledbury shales, form a transition to the Old Red Sandstone are quarried at Dymock. The "Old Red," itself occurs at Berkeley, Tewkesbury Green, Thornbury, and several places in the Bristol coal-field, in antifacial folds forming hills. It forms also the great basin extending from Ross to Monmouth and from Dymock to Mitcheldean, Abenhall, Blakeney, &c., within which is the famous Older Red Sandstone basin of the Wye from Monmouth to Woolaston. This formation is over 3000 ft. thick in the forest of Dean. The Bristol and Forest Carboniferous basins lie within the synclinal folds of the Old Red Sandstone, and through both the folds have been modified, they must have been once continuous, as further appears from the existence of an intermediate basin, recently pierced, under the Severn. The lower limestone shales are 500 ft. thick in the Bristol district, and the lower Old Red Sandstone is 360 ft. thick in the county. These shales, which are limestone rich, have been quarried for lime and road metal. Above this comes the Millstone Grit, well seen in the Avon, and in the Severn at Clifton, where it is 360 ft. thick. This rock is famous also for iron, and is joined to the coal-bed in the forest. On this rest the Coal Measures, consisting in the Bristol field of two great series, the lower 2000 ft. thick, with 36 seams, the upper 3500 ft., with 222 seams, 9 of which reach 2 ft. in thickness. These two series are separated by over 1700 ft. of hard sandstone (Pennant Grit), containing only 5 coal-seams. In the Forest coal-field the whole series is not 3000 ft. thick, with but 15 seams. At Durham Down a dolomitic conglomerate, of the age known as Keuper or Upper Trias, rests unconformably on the edges of the Palaeozoic rocks, and is evidently a shore deposit, yielding dinosaurian remains. Above the Keuper clays comes the Pennant Sandstone. The coal-bearing strata, together with the lower part of the Millstone Grit, are known as the Inferior Oolite, and dipping with it to S.E., is the "fuller's earth," a rubbly limestone about 100 ft. thick, throwing out many of the springs which form the head waters of the Thames. Next comes the Great or Bath Oolite, at the base of which are the Stonesfield "slate" beds, quarried for roofing, paling, &c., at Sevenhampton and elsewhere. From the Great Oolite Minchinhampton stone is obtained, at which a show is given in the flaggs near Painswick and Stroud. This is a typical section of the Lower Oolite, where the sands are cappared by 40 ft. of a remarkable peat grit. Above this are 147 ft. of freestone, 7 ft. of oolite marl, 34 ft. of upper freestone and 36 ft. of ragstone. The Painswick stone being a white limestone, known as the Forest Marble. Ripple marks are abundant on the flaggs; in all the Oolites seem to have been near shore or in shallow water, many beds being impregnated with thin beds of shale. The highest bed of the Lower Oolite is the Cornbrash, about 40 ft. of rubble, productive in corn, forming a narrow belt from Siddington to Fairford. Near the latter town and Lechlade is a fine exposure of "the Medes," as the countrymen call it, in thin beds or good slates which are used for roofing. The Middle Old Red is formed of no higher Secondary or Tertiary rocks; but the Quaternary series is represented by much northern drift gravel in the vale and over Severn, by accumulations of Oolitic detritus, including peat and Glacial distinct marl, in which remains on the flanks of the Cotswolds, and by submerged forests extending from Sharpness to Gloucester.

Agriculture.—The climate is mild. Between three-quarters and four-sevenths of the total area is under cultivation, and of this four-sevenths is in permanent pasture. Wheat is the chief grain crop. In the vale the deep rich black and loamy soil is well adapted for pastureage, and a moist mild climate favours the growth of cereals and root crops; and, in the Vale of the Thames, and in the counties of Oxford and Berkshire, are moor shorthorns, of which many are fed for distant markets, and many reared and kept for dairy purposes. The rich grazing fields of the vale of Berkeley produces the famous "double cheese" cheeses, and the vale in general has long been celebrated for cheese and butter. The vale of Gloucester is the chief grain-growing district. Turnips, &c., occupy about three-fourths of the green crop acreage, potatoes occupying only about a twelfth. A feature of the county is its apple and pear orchards, chiefly for the manufacture of cider and perry, which are attached to nearly every farm. The Cotswolds district is comparatively dry, but it has the advantage of being almost entirely forested, and since the 17th century for the breed of sheep named after it. Oats and barley are here the chief crops.

Manufactures.—The manufacture of woolen cloth followed upon the early success in sheep-farming among the Cotswolds. This industry is not confined to the hill country or even to Gloucestershire itself in the west of England. The description of cloth principally manufactured is broadcloth, dressed with teasels to produce a short
GLOUCESTERSHIRE

The midland eastern counties; lines, routes, and stations, and this is Wotton-under-Edge, North Nibley and others. Machinery and tools, paper, furniture, pottery and glass are also produced. Ironstone, clay, limestone and sandstone are worked, and the coal mines are at Nailsworth and Dodington. Of less importance is the field in the south of the county, N.E. of Bristol. Strontium sulphate is dug from shallow pits in the red marl of Gloucestershire and South Gloucestershire.

Communications.—Railway communications are provided principally by the Great Western and Midland companies. Of the Great Western lines, the main line serves Bristol from London. It divides at the Englefield station into one branch going north to the western counties, and another to South Wales, crossing beneath the Severn by the Severn Tunnel, 41 m. in length, a remarkable engineering work. A more direct route, which avoids the lake between London and South Wales, is by a line from Wootton Bassett on the main line, running north of Bristol by Badminton and Chipping Sodbury. Other Great Western lines are from Swindon on the main line, by the Stroud valley to Gloucester, crossing the Severn there, and continuing by the Bristol bank of the river into Wales, with branches north-west into Herefordshire; the Oxford and Worcester trunk line, crossing the north-east of the county, connected with Cheltenham and Gloucester by a branch through the Cotswolds, from Chipping Norton junction; and the line from Cheltenham by Broadway to Honeybourne. The west-and-north line of the Midland railway follows the vale from Swindon by Cricklade and Chipping Sodbury, with a branch of the forest of Dean by Berkeley, crossing the Severn at Sharpness by a great bridge 1387 yds. in length, with 22 arches. The coal-fields of the forest of Dean are served by several branch lines. In the north, the Severn Tunnel is by a Midland line from Malvern to Winchcomb. The Midland and South-western Jenny Tun rail runs east and south from Cheltenham by Cirencester, affording communication of Enstone and Evesham to the East and West of the Cotswolds. The Midland Western from Oxford terminates at Fairfield. The Thames and Severn canal, rising to a summit level in the tunnel through the Cotswolds at Sapperton, is continued from Wallbridge (Stroud) by the Stroudwater canal, and gives communal communication between the two great rivers. The Berkeley Ship Canal (161 m.) connects the port of Gloucester with its outlet at Sharpness on Severn.

Population and Administration.-The area of the ancient county is 798,145 acres, with a population in 1891 of 599,047 and in 1901 of 631,729. The area of the administrative county is 805,482 acres. The county contains 28 hundreds. The municipal boroughs are—Bristol, a city and county borough (pop. 328,945); Cheltenham (40,339), Gloucester, a city and county borough (47,955); Tewkesbury (5419). The other urban districts are—Awre (1096), Charlton Kings (3806), Cirencester (7580), Coleford (2541), Kingswood, on the eastern outskirts of Bristol (11,961), Nailsworth (9308), Newnham (1184), Stow-on-the-Wold (1386), Stroud (9153), Tewbury (1289), Westbury-on-Severn (1866). The number of small ancient market towns is large. There are 115 villages in the northern half, 155 in the south, in the shire, and among the foot hills of the woods. Those in the forest district are mostly connected with the coal trade, such as Lydney (3559), besides Awre and Coleford; and, to the north, beside Minchinhampton and Stroud, and south, there are Minchinhampton (3737) and Nailsworth; near the south-eastern boundary Tewbury and Marshfield; Stonehouse (2183), Dundas (2727), Biddeston and the Upper-Hill (2542) and Chipping Sodbury (1825). The population, scattered along the western line of the hills and between the Severn and the Berkeley, and Thornbury (2594). Among the uplands of the Cotswolds there are no towns, and villages are few, but in the east of the county, in the upper Thames basin, there are, besides Cirencester, Fairford on the Cot and Lechlade, close to the head of the navigation on the Thames itself. Far up in the Leach valley, remote from railway communication, is Northleach, once a great posting station on the road from Oxford and Cheltenham road. In the north-east, the Severn-Tew, standing high, and Moreton-in-the-Marsh near the headwaters of the Evenlode. In a northern prolongation of the county, similarly marshy, lies Cirencester, the ancient capital of Cenomannica, 6 m. N.E. of Cheltenham. In the north-west, Newent (2485) is the only considerable town. Gloucestershire is in the Oxford circuit, and assizes are held at Gloucester. It has one court of quarter sessions, and is divided into 24 petty sessional divisions. The boroughs of Bristol, Gloucester and Tewkesbury have separate commissions of the peace and courts of quarter sessions. There are 359 civil parishes in Gloucestershire, which is principally in the diocese of Gloucester, but part is in that of Bristol, and all fall within those of Gloucester and Oxford. There are 408 ecclesiastical parishes or districts wholly or in part within the county. There are five parliamentary divisions, namely, the counties of Gloucester, Cheltenham, Cirencester, Tewkesbury, and Forest of Dean, each returning one member. The county also includes the boroughs of Gloucester and Cheltenham, each returning one member; and the greater part of the borough of Bristol, which returns two members.

History.—The English conquest of the Severn valley began in 577 with the victory of Ceawlin at Deorham, followed by the capture of Cirencester, Gloucester and Bath. The Hwicas who occupied the district were a West Saxon tribe, but their territory had become a dependency of Mercia in the 7th century, and was not brought under West Saxon dominion until the 9th century. No important settlements were made by the Danes in the district. Gloucestershire probably originated as a shire in the 10th century, and is mentioned by name in the Anglo-Saxon Chronicle in 1016. Towards the close of the 11th century the boundaries were readjusted to include Winchcomb, hitherto a county by itself, and at the same time the Gloucestershire Forest of Dean was transferred to Gloucestershire. The divisions of the county for a long time remained very unsettled, and the thirty-nine hundreds mentioned in the Domesday Survey and the thirty-one hundreds of the Hundred Rolls of 1274 differ very widely in name and extent both from each other and from the twenty-eight hundreds of the present day.

Gloucestershire formed part of Harold's earldom at the time of the Norman invasion, but it offered slight resistance to the Conqueror. In the wars of Stephen's reign the cause of the empess Maud was supported by Robert of Gloucester who had rebuilt the castle at Bristol, and the castles at Gloucester and Cirencester were also garrisoned on her behalf. In the barons' war of the reign of Henry III. Gloucester was garrisoned for Simon de Montfort, but was captured by Prince Edward in 1265, in which year de Montfort was slain at Evesham. Bristol and Gloucester actively supported the Yorkist cause during the Wars of the Roses. In the religious struggles of the 16th century Gloucester showed strong Protestant sympathy, and in the reign of Mary I. Bristol and Gloucester were the seat of the Eastern Association. Gloucestershire is divided by the Forest of Dean at Tiddley, and by the two rivers of the West: the Severn, and by the Avon and the Wye and the Severn was added to Gloucestershire. The divisions of the county for a long time remained very unsettled, and the thirty-nine hundreds mentioned in the Domesday Survey and the thirty-one hundreds of the Hundred Rolls of 1274 differ very widely in name and extent both from each other and from the twenty-eight hundreds of the present day.

Bristol was a county in 1425, and in 1483 Richard III. created Gloucester an independent county, adding to it the hundreds of Dudston and King's Barton. The latter were reunited to Gloucestershire in 1673, but the cities of Bristol and Gloucester continued to rank as independent counties, with separate jurisdiction, county rate and assizes. The chief officer of the forest of Dean was the warden, who was generally also constable of St Brivial Castle. The first justice-seat for the forest was held at Gloucester Castle in 1283, the last in 1563. The honor of the duchy of Lancaster is within the jurisdiction of the duchy of Lancaster for certain purposes.

The physical characteristics of the three natural divisions of Gloucestershire have given rise in each to a special industry, as already indicated. The forest district, until the development of the Sussex mines in the 16th century, was the chief iron-producing area of the kingdom, the mines having been worked in Roman times, while the abundance of timber gave rise to numerous tanneries and to an important ship-building trade. The hill district, besides fostering agricultural pursuits, granted the woolen trade from the big towns, which now devoted themselves almost entirely to foreign commerce. Silk-weaving was introduced in the 17th century, and was especially prosperous in the Stroud valley. The abundance of clay and building-stone in the county gave rise to considerable manufactures of brick, tiles and pottery. Numerous minor industries sprang up in the 17th and 18th centuries, such as flax-growing and the manufacture of pins, buttons, lace, stockings, rope and sailcloth.

Gloucestershire was first represented in parliament in 1290 when it returned two members. Bristol and Gloucester acquired representation in 1295, Cirencester in 1357 and Tewkesbury in 1360. Under the Reform Act of 1832 the county returned four members in two divisions; Bristol, Gloucester, Cirencester, Stroud and Tewkesbury returned two members each, and Cheltenham returned one member. The act of 1868 reduced the representation of Cirencester and Tewkesbury to one member each.

Antiquities.—The cathedrals of Gloucester and Bristol, the magnificent abbey church of Tewkesbury, and the church of Cirencester with its great Perpendicular porch, are described under their separate headings. Of the abbey of Hayles near Winchcomb, founded by Richard, earl of Cornwall, in 1246, little more than the foundations are left, but these have been excavated with great care, and interesting fragments have been brought to light. Most of the old market towns have fine parish churches. At Deerhurst near Tewkesbury, and Cleeve near Cheltenham, there are churches of special interest on account of the pre-Norman work they retain. The Perpendicular church at Lechlade is unusually perfect; and that at Fairford was built (c. 1500), according to tradition, to contain the remarkable series of stained-glass windows, which are said to have been brought from the Netherlands. These are, however, adjudged to be of English workmanship, and are one of the finest series in the country. The great Decorated Calcot Barn is an interesting relic of the monastery of Kingswood near Tetbury. The castle at Berkeley is a splendid example of a feudal stronghold. Thornbury Castle, in the same district, is a fine Tudor ruin, the pretensions of which evoked the jealousy of Cardinal Wolsey against its builder, Edward Stafford, duke of Buckingham, who was beheaded in 1521. Near Cheltenham is the fine 15th-century mansion of Southam de la Bere, of timber and stone. Memorials of the de la Bere family appear in the church at Cleeve. The mansion contains a tiled floor from Hayles Abbey. Near Winchcomb is Sudeley Castle, dating from the 15th century, but the inhabited portion is chiefly Elizabethan. The chapel is the burial place of Queen Catherine Parr. At Great Badminton is the mansion and vast domain of the Beauforts (formerly of the Botelers and others), on the south-eastern boundary of the county.

GLOVE (O. Eng. glof, perhaps connected with Gothic lofa, the palm of the hand), a covering for the hand, commonly with a separate sheath for each finger.

The use of gloves is of high antiquity, and apparently was known even to the pre-historic cave dwellers. In Homer Laërtes is described as wearing gloves (χειρόσ τε βεροι) while walking in his garden (Od. xxiv. 230). Herodotus (vi. 72) tells how Lectychedes filled a glove (χειρας) with the money he received as a bribe, and Xenophon (Cyrop. viii. 1. 17) records that the Persians were fur gloves having separate sheaths for the fingers (χειρας διακειαι και δακτυλοσκιετα). Among the Romans also there are occasional references to the use of gloves. According to the younger Pliny (Ep. iii. 5. 15) the secretary whom his uncle had with him when ascending Vesuvius wore gloves (manus) so that he might not be impeded in his work by the cold, and Varro (R.R. i. 55. 1) remarks that olives gathered with the bare fingers are better than those gathered with gloves (digitubula or digitubila). In the northern countries the general use of gloves was more natural than in the south, and it is easy to see what significance the use of gloves had in the midst of an absence of clothing. It is given to the Middle Ages to make a specialty of gloves, and Latin word for glove (gualtus or wautus, Mod. Fr. gant) is of Teutonic origin (O. H. G. ger. want). Thus in the life of Columbanus by Jonas, abbot of Bobbio (d. c. 605), gloves for protecting the hands in doing manual labour are spoken of as tegumenta manus quae Galli wantus vocant. Among the Germans and Scandinavians, in the 8th and 9th centuries, the use of gloves, fingerless at first, would seem to have been all but universal; and in the case of kings, prelates and nobles they were often elaborately embroidered and bejeweled. This was more particularly the case with the gloves which formed part of the pontifical vestments (see below). In war and in the chase gloves of leather, or with the backs armoured with articulated iron plates, were early worn; yet in the Bayeux tapestry the warriors on either side fight ungloved. The fact that gloves are not represented by contemporary artists does not prove their non-existence, since this might easily be an omission due to lack of observation or of skill; but, so far as the records go, there is no evidence to prove that gloves were in general use in England until the 13th century. It was in this century that ladies began to wear gloves as ornaments; and it is from this period onwards that they are represented in art. It was, however, not till the 16th century that they reached their greatest elaboration, when Queen Elizabeth set the fashion for wearing them richly embroidered and jeweled.

The symbolic sense of the middle ages early gave to the use of gloves a special significance. Their liturgical use by the Church is dealt with below (Pontifical gloves); this was imitated from the usage of civil life. Embroidered and jewelled gloves formed part of the insignia of the emperors, and also, and that quite early, of the kings of England. Thus Matthew Paris, in recording the burial of Henry II. in 1189, mentions that he was buried with his complete armor, with a golden crown on his head and gloves on his hands. Gloves were also found on the hands of King John when his tomb was opened in 1797, and on those of King Edward I. when his tomb was opened in 1774. See W. B. Reffern, Royal and Historic Gloves and Shoes, with numerous examples.

Gages.—Of the symbolic uses of the glove one of the most widespread and important during the middle ages was the practice of tendering a folded glove as a gage for waging one's war. The origin of this custom is probably not far to seek. The promise to fulfill a judgment of a court of law, a promise secured by the delivery of a ved or gage, is one of the oldest, if not the very oldest, of all enforceable contracts. This gage was originally.
a chattel of value, which had to be deposited at once by the defendant as security into his adversary’s hand; and that the glove became the formal symbol of such deposit is doubtless due to its being the most convenient loose object for the purpose. The custom survived after the contract with the *vadium, wed* or *gave* had been superseded by the contract with pledges (personal sureties). In the rules of procedure of a baronial court of the 14th century we find: “He shall wage his law with his folded glove (*de son gaunt fyve*) and shall deliver it into the hand of the other, and then take his glove back and find pledges for his law.” The delivery of the glove had, in fact, become a ceremonial rite, because the defendant had his sureties close at hand.1

Associated with this custom was the use of the glove in the wager of battle (*vadium in duello*). The glove here was thrown down by the defendant in open court as security that he would defend his cause in arms; the accuser by picking it up accepted the challenge (see WAGER). This form is still prescribed for the challenge of the king’s champion at the coronation of English sovereigns, and was actually followed at that of George IV, (see CHAMPION). The phrase “to throw down the gauntlet” is still in common use of any challenge.

**Pledges of Service.**—The use of the glove as a pledge of fulfilment is exemplified also by the not infrequent practice of entangling vassals by investing them with the glove; similarly the emperors symbolized by the bestowal of a glove the concession of the right to found a town or to establish markets, mints and the like; the “hands” in the armorial bearings of certain German towns are really gloves, reminiscent of this investiture. Conversely, fiefs were held by the render of presenting gloves to the sovereign. Thus the manor of Little Holland in Essex was held in Queen Elizabeth’s time by the service of one knight’s fee and the rent of a pair of gloves turned up with hare’s skin (Blount’s *Teneures*, ed. Beckwith, p. 130). The most notable instance in England, however, is the grand serjeancy of finding for the king a glove for his right hand on coronation day, and supporting his right arm as long as he holds the sceptre. The right to perform this “honourable service” was originally granted by William the Conqueror to Bertram de Verdun, together with the manor of Fernham (Farnham Royal) in Buckinghamshire. The male descendants of Bertram performed this serjeancy at the coronations until the death of Theobald de Verdun in 1316, when the right passed, with the manor of Fernham, to Thomas Lord Furnival by his marriage with the heiress Joan. His son William Lord Furnival performed the ceremony at the coronation of Richard II. He died in 1383, and his daughter and heiress Jean de Furnival having married Sir Thomas Nevill, Lord Furnival in her right, the latter performed the ceremony at the coronation of Henry IV. His heiress Maud married Sir John Talbot (1st earl of Shrewsbury) who, as Lord Furnival, presented the glove embroidered with the arms of Verdun at the coronation of Henry V. When in 1541 Francis earl of Shrewsbury exchanged the manor of Fernham with King Henry VIII. for the site and precincts of the priory of Worksp in Nottinghamshire he stipulated that the right to perform this serjeancy should be reserved to him, and the king accordingly transferred the obligation from Farnham to Worksp. On the 3rd of April 1838 the manor of Worksp was sold to the duke of Newcastle and with it the right to perform the service, which had hitherto always been carried out by a descendant of Bertram de Verdun. At the coronation of King Edward VII. the earl of Shrewsbury disputed the duke of Newcastle’s right, on the ground that the serjeancy was attached not to the manor but to the priory lands at Worksp, and that the latter had been subdivided by sale so that no single person was entitled to perform the ceremony and the right had therefore lapsed. His petition for a regrant to himself as lineal heir of Bertram de Verdun, however, was disallowed by the court of claims, and the serjeancy was declared to be attached to the manor of Worksp (G. Woods Wollaston, *Coronation Claims*, London, 1903, p. 133).

**Presentations.**—From the ceremonial and symbolic use of gloves the transition was easy to the custom which grew up of presenting them to persons of distinction on special occasions. When Queen Elizabeth visited Cambridge in 1578 the vice-chancellor offered her a “pair of gloves, perfumed and garnished with embroideerie and golldsmithes worooke, price 60s.” and at the visit of James I. there in 1615 the mayor and corporation of town “delivered His Majesty a fair pair of perfumed gloves with golde laces.” It was formerly the custom in England for bishops at their consecrations to make presents of gloves to those who came to their consecration dinners and others, but this gift became such a burden to them that by an order in council in 1678 it was commuted for the payment of a sum of five pounds towards the rebuilding of St Paul’s. Serjeants at law, on their appointment, were given a pair of gloves containing a sum of money which was termed “regards”; this custom is recorded as early as 1495, when according to the *Black Book* of Lincoln’s Inn each of the new serjeants received £6. 13s. 4d. and a pair of gloves costing 4d., and it persisted to a late period. At one time it was the practice for a prisoner who pleaded the king’s pardon on his discharge to present the judges with gloves by way of a fee. Glove-silver, according to Jacob’s *Law Dictionary*, was a name used of extraordinary rewards formerly given to officers of courts, &c., or of money given by the sheriff of a county in which no offenders were left for execution to the clerk of assize and judge’s officers; the explanation of the term is that the glove given as a perquisite or fee was in some cases lined with money to increase its value, and thus came to stand for money ostensibly given in lieu of gloves. It is still the custom in the United Kingdom to present a pair of white gloves to a judge or magistrate who when he takes his seat for criminal business at the appointed time finds no cases for trial. By ancient custom judges are not allowed to wear gloves while actually sitting on the bench, and a witness taking the oath must remove the glove from the hand that holds the book. (See J. W. Norton-Kyshe, *The Law and Customs relating to Gloves*, London, 1901.)

**Pontifical gloves (Lat. *crochoteca*) are liturgical ornaments peculiar to the Western Church and proper only to the pope, the cardinals and bishops, though the right to wear them is often granted by the Holy See to abbots, cathedral dignitaries and other prelates, as in the case of the other episcopal insignia. According to the present use the gloves are of silk and of the liturgical colour of the day, the edge of the opening ornamented with a narrow band of embroidery or the like, and the middle of the back with a cross. They may be worn only at the celebration of mass (except masses for the dead). In vesting, the gloves are put on the bishop immediately after the dalmatic, the right hand one by the decan, the other by the subdeacon. They are worn only until the auition before the canon of the mass, after which they may not again be put on. At the consecration of a bishop the consecrating prelate puts the gloves on the new bishop immediately after the mitre, with a prayer that his hands may be kept pure, so that the sacrifice he offers may be as acceptable as the gift of venison which Jacob, his hands wrapped in the skin of kids, brought to Isaac. This symbolism (as in the case of the other vestments) is, however, of late growth. The liturgical use of gloves itself cannot, according to Father Braun, be traced beyond the beginning of the 17th century, and their introduction was due, perhaps to the simple desire to keep the hands clean for the holy mysteries, but more probably merely as part of the increasing pomp with which the Carolingian bishops were surrounding themselves. From the Frankish kingdom the custom spread to Rome, where liturgical gloves are first heard of in the earlier half of the 11th century. The earliest authentic instance of the right to wear them being granted to a non-bishop is a bull of Alexander IV. in 1270, confirming it to the bishopric of Viterbo.**

GLOVER, SIR J. H.—GLOVERSVILLE

were worn were not so carefully defined as now, the use varying in
different churches. Nor were the liturgical colours prescribed.
The most characteristic feature of the medieval pontifical glove
was the ornament (tessellae, filibus, monile, paritiria) set in the
middle of the back of the glove. This was usually a small plaque
of metal, enamelled or jewelled, generally round, but sometimes
square or irregular in shape. Sometimes embroidery was substi-
tuted; still more rarely the whole glove was covered, even to the
fingers, with elaborate needlework designs.

Liturgical gloves have not been worn by Anglican bishops since
the Reformation, though they are occasionally represented as
wearing them on their effigies.

See also CHANCE-GEWUNDUNG (Freiberg in Bergsau, 1907), pp. 359-382, where many beautiful examples are illustrated.

Manufacture of Gloves.—Three countries, according to an old
proverb, contribute to the making of a good glove—Spain dressing
the leather, France cutting it and England sewing it. But the manufacture of gloves was not introduced into Great
Britain till the 10th or 11th century. The foundation of
the glove manufacture in Peru was chartered in 1603, and in 1590 a glove-
maker's guild was formed in France, with the object of regulating
the trade and ensuring good workmanship. The gloves of
London in 1340 framed their ordinances and had them approved
by the corporation, the city regulations at that time fixing the
price of a pair of common sheepskin gloves at 6d. In 1494, when
the gild received armorial bearings, they do not seem to have been
very strong, but apparently their position improved sub-
sequently and in 1638 they were incorporated as a new company.
In 1535, two guilds of gloves and three of mittens were
incorporated at London, and in 1661 a company of gloves was
incorporated at Worcester, which still remains an important seat
of the English glove industry. In America the manufacture of
gloves dates from about 1760, when Sir William Johnson brought
over several families of glove makers from Perth; these settled
in Fulton county, New York, which is now the largest seat of the
glove trade in the United States.

GLOVERSVILLE, a village in the town of Gloversville, in the
county, state and diocese of Albany, New York, United States.
The name was given by William D. Harris, of Gloversville,
Holland, who was the first settler and the founder of the
postoffice, G. T. Knowles, Postmaster.

GLOVER, SIR JOHN HAWLEY (1820-1889), captain in the
British navy, entered the service in 1841 and passed his examination
as lieutenant in 1849, but did not receive a commission till
May 1857. He served on various stations and was wounded severely in an action with the Burmese at Donabeb (4th
February 1853). But his reputation was not gained at sea and
as a naval officer, but on shore and as an administrative official in
the colonies. During his years of service as lieutenant in the
navy he had had considerable experience of the coast of Africa,
and had taken part in the expedition of Dr W. B. Baikie (1824-
1864) up the Niger. On the 21st of April 1865 he was appointed
administrator of the government of Lagos, and in that capacity,
or as colonial secretary, he remained there till 1872. During this
period he had been much employed in expelling the marauding
incursions of the Ashantis. When the Ashanti war broke out
in 1873, Captain Glover undertook the hazardous and doubtful
task of organizing the native tribes, whom hatred of the Ashantis
might be expected to make favourable to the British authorities—
to the extent at least to which their fears would allow them to act.
His services were accepted, and in September of 1873 he landed at
Cape Coast, and, after forming a small trustworthy force of
Hausa, marched to Accra. His influence sufficed to gather a
numerous native force, but neither he nor anybody else could
overcome their abject terror of the ferocious Ashantis to the
extent of making them fight. In January 1874 Captain Glover
met General Gordon, and rendered him the high compliment
of being at the head of a Hausa force. His services were
acknowledged by the thanks of parliament and by his creation
as G.C.M.G. In 1875 he was appointed governor of Newfoundland
and held the post till 1881, when he was transferred to the
Leeeward Islands. He returned to Newfoundland in 1883, and
died in London on the 30th September 1885.

Lady Glover's Life of her husband appeared in 1897.

GLOVER, RICHARD (1712-1785), English poet, son of Richard
Glover, a Hamburg merchant, was born in London in 1712. He
was educated at Cheapside School, and at Magdalen College,
Oxford, where he graduated M.A. in 1736. In his sixteenth year he published a small volume, containing the four
verse translations of Horace, and in his eighteenth he published a
sixteen line poem to the memory of Sir Isaac Newton, which
was prefixed by Dr Pemberton to his View of Newton's Philosophy,
published in 1728. In 1737 he published an epic poem in praise
of liberty, Leonidas, which was thought to have a special reference
to the politics of the time; and being warmly commended by the
prince of Wales and his court, it soon passed through several
editions. In 1739 Glover published a poem entitled London, or
the Progress of Commerce; and in the same year, with a view to
exciting the nation against the Spaniards, he wrote a spirited
ballad, Hudson's Ghost, very popular in its day. He was also the
author of two tragedies, Boudicca (1753) and Medea (1761),
written in close imitation of Greek models. The success of
Glover's Leonidas led him to take considerable interest in politics,
and in 1761 he entered parliament as member for Weymouth.
He died on the 25th of November 1785. The Athenian, an epic
in thirty books, was published in 1787, and his diary, entitled
Memoirs of a distinguished literary and political Character from
1742 to 1757, appeared in 1813. Glover was one of the reputed
authors of Junius; but his claims—which were advocated in an
article entitled "Observing the Authorship of the Letters of Junius" (1815),
by R. Dupep—rest on very slight grounds.

GLOVERSVILLE, a town in Fulton county, New York, United
States, at the foot-hills of the Adirondacks, about 55 m. N.W.
of Albany. Pop. (1800) 13,864; (1900) 18,349, of whom 2542
were foreign-born; (1910 census) 20,642. It is served by the
Fonda, Johnstown & Gloversville railway (connecting at Fonda, about 9 m. distant, with the New York Central),
and by electric lines connecting with Johnstown, Amsterdam
and Schenectady. The city has a public library (26,000
volumes in 1908), the Nathan Littauer memorial hospital,
a state armory and a fine government building. Gloversville
is the principal glove-manufacturing centre in the United
States. In 1900 Fulton county produced more than 37
and Gloversville 38.8%, of all the leather gloves and mittens
made in the United States; in 1905 Gloversville produced 29.9% of
the leather gloves and mittens made in the United States,
its products being valued at $5,302,106. Gloversville has more
than a score of tanneries and leather-finishing factories, and
manufactures fur goods. In 1905 the city's total factory product
was valued at $9,340,763. The extraordinary localization of the
glove-making industry in Gloversville, Johnstown and other
parts of Fulton county, is an incident of much interest in the
economic history of the United States. The industry seems to
have had its origin among a colony of Perthshire families,
including many glove-makers, who were settled in this region
by Sir William Johnson about 1760. For many years the entire
product seems to have been disposed of in the neighbourhood,
but about 1860 the goods began to find more distant markets,
and by 1825 the industry was firmly established on a prosperous

basis, the trade being handed down from father to son. An interesting phase of the development is that, in addition to the factory work, a large amount of the industry is in the hands of "home workers" both in the town and country districts.

Gloversville, settled originally about 1770, was known for some time as Stump City, its present name being adopted in 1832. It was incorporated as a village in 1851 and was chartered as a city in 1859.

LOW WORM, the popular name of the wingless female of the beetle *Lampyris noctiluca*, whose power of emitting light has been familiar for many centuries. The luminous organs of the glow-worm consist of cells similar to those of the fat-body, grouped into paired masses in the ventral region of the hinder abdominal segments. The light given out by the wingless female insect is believed to serve as an attraction to the flying male, whose luminous organs remain in a rudimentary condition. The common glow-worm is a widespread European and Siberian insect, generally distributed in England and ranging in Scotland northwards to the Tay, but unknown in Ireland. Exotic species of *Lampyris* are similarly luminous, and light-giving organs are present in many genera of the family *Lampyridae* from various parts of the world. Frequently—as in the south European *Luciola italica*—both sexes of the beetle are provided with wings, and both male and female emit light. These luminous, winged Lampyrids are generally known as "fire-flies." In correspondence with their power of emitting light, the insects are nocturnal in habit.

GLOXINIA, a charming decorative plant, botanically a species of *Sinningia* (*S. speciosa*), a member of the natural order Gesneraceae and a native of Brazil. The species has given rise under cultivation to numerous forms showing a wonderful variety of colour, and hybrid forms have also been obtained between these and other species of *Sinningia*. A good strain of seed will produce many superb and charmingly coloured varieties, and if sown early in spring, in a temperature of 65° at night, they may be shifted on into 6-in. pots, and in these may be flowered during the summer. The bulbs are kept at rest through the winter in dry sand, in a temperature of 50°, and to yield a succession should be started at intervals, say at the end of February and the beginning of April. To prolong the blooming season, use weak manure water when the flower-buds show themselves.

GLUCINUM, an alternative name for Beryllium (q.v.). When L. N. Vauquelin in 1785 published in the *Annales de chimie* an account of a new earth obtained by him from beryl he refrained from giving the substance a name, but in a note to his paper the editors suggested glucine, from *Glaucus*, sweet, in reference to the taste of its salts, whence the name Glucinium or Glucinum (symbol Gl. or sometimes G). The name beryllium was given to the metal by German chemists and was generally used until recently, when the earlier name was adopted.

GLUCK, 1 CHRISTOPH WILLIBALD (1719-1787), operatic composer, German by his nationality, French by his place in art, was born at Wendenwang, near Neumarkt, in the upper Palatinate, on the 2nd of July 1714. He belonged to the lower middle class, his father being gamekeeper to Prince Lobkowitz; but the boy's education was not neglected on that account. From his twelfth to his eighteenth year he frequented the Jesuit school of Kommotau in the neighbourhood of Prince Lobkowitz's estate in Bohemia, where he not only received a good general education, but also had lessons in music. At the age of eighteen Gluck went to Prague, where he continued his musical studies under Černohorsky, and maintained himself by the exercise of his art, sometimes in the very humble capacity of fiddler at village fairs and dances. Through the introductions of Prince Lobkowitz, however, he soon gained access to the best families of the Austrian nobility; and when in 1736 he proceeded to Vienna he was hospitably received at his protector's palace. Here he met Prince Melzi, an ardent lover of music, whom he accompanied to Milan, continuing his education under Giovanni Battista San Martini, a great musical historian and contrapuntist, who was also famous in his own day as a composer of church and chamber music. We soon find Gluck producing operas at the rapid rate necessitated by the omnivorous taste of the Italian public in those days. Nine of these works were produced at various Italian theatres between 1741 and 1745. Although their artistic value was small, they were so favourably received that in 1745 Gluck was invited to London to compose for the Haymarket. The first opera with which he was successful was *La Caduta dei giganti*; it was followed by a revised version of one of his earlier operas. Gluck also appeared in London as a performer on the musical glasses (see Harmonica).

The success of his two operas, as well as that of a pasticcio (i.e. a collection of favourite arias set to a new libretto) entitled *Piramo e Tisbe*, was anything but brilliant, and he accordingly left London. But his stay in England was not without important consequences for his subsequent career. Gluck at this time was rather than an ordinary performer of Italian opera. Handel's well-known saying that Gluck "knew no more counterpoint than his cook" must be taken in connexion with the less well-known fact that that cook was an excellent bass singer who performed in many of Handel's own operas. But it indicates the musical reason of Gluck's failure, while Gluck himself learnt the dramatic reason through his surprise at finding that arias which in their original setting had been much applauded lost all effect when adapted to new words in the pasticcio. Irrelevant as Handel's criticism appears, it was not without bearing on Gluck's difficulties. The use of counterpoint has little necessary connexion with contrapuntal display; its real and final cause is a certain depth of harmonic expression which Gluck attained only in his most dramatic moments, and for want of which he, even in his finest works, sometimes moved very lamely.

And in later years his own mature view of the importance of harmony, which he upheld in long arguments with Grétry, who believed only in melody, shows that he knew that the dramatic expression of music must strike below the surface. At this early period he was simply producing Handelian opera in an amateurish style, suggesting an unsuccessful imitation of Hasse; but the failure of his pasticcio is as significant to us as it was to him, since it shows that already the effect of his music depended upon its characteristic treatment of dramatic situations. This characterizing power was as yet not directly evident, and it needed all the influence of the new instrumental resources of the rising sonata-forms before music could pass out of what we may call its architectural and decorative period and enter into dramatic regions at all.

It is highly probable that the chamber music of his master, San Martini, had already indicated to Gluck a new direction which was more or less incompatible with the older art; and there is nothing discreditable either to Gluck or to his contemporaries in the failure of his earlier works. Had the young composer been successful in the ordinary opera seria, there is reason to fear that the great dramatic reform, initiated by him, might not have taken place. The critical temper of the London public fortunately averted this calamity. It may also be assumed that the musical atmosphere of the English capital, and especially the works of Handel, were not without beneficial influence upon the young composer. But of still greater importance in this respect was a short trip to Paris, where Gluck became for the first time acquainted with the classic traditions and the declamatory style of the French opera—a sphere of music in which his own greatest triumphs were to be achieved. Of these great issues little trace, however, is to be found in the works produced by Gluck during the fifteen years after his return from England. In this period Gluck, in a long course of works by no means free from the futile old traditions, gained technical experience and important patronage, though his success was not uniform. His first opera written for Vienna, *La Semiramide riconosciuta*, is again an ordinary opera seria, and little more can be said of *Telemaco*, although thirty years later Gluck was able to use most of its overture and an energetic duet in one of his greatest works, *Armide*.

---

1 Not, as frequently spelt, Glîck.
GLUCK

Gluck settled permanently at Vienna in 1756, having two years previously been appointed court chapel-master, with a salary of 2000 florins, by the empress Maria Theresa. He had already received the order of knighthood from the pope in consequence of the successful production of two of his works in Rome. During the long interval from 1756 to 1762 Gluck seems to have matured his plans for the reform of the opera; and, barring a ballet named Don Giovanni, and some airs nouveaux to French words with pianoforte accompaniment, no compositions of any importance have to be recorded. Several later pièces d'occasion, such as Il Trionfo di Clelia (1763), are still written in the old manner, though already in 1762 Orfeo ed Euridice shows that the composer had entered upon a new career. Gluck had for the first time deserted Metastasio, for Rameau's La Maja Lointaine. Vernon Lee suggests, was in all probability the immediate cause of the formation of Gluck's new ideas, as he was a hot-headed dramatic theorist with a violent dislike for Metastasio, who had hitherto dominated the whole sphere of operatic libretto.

Quite apart from its significance in the history of dramatic music, Orpheus is a work which, by its intrinsic beauty, commands the highest admiration. Orpheus's air, Che faro, is known to every one; but still finer is the great scena in which the poet's song softens even the ombre desolée of Tartarus. The ascending passion of the entries of the solo (Deki placient; Mille pene; Mon tiranne), interrupted by the harsh but gradually softening exclamations of the Furies, is of the highest dramatic effect. These melodies, moreover, as well as every declamatory passage assigned to Orpheus, are made subservient to the purposes of dramatic characterization; that is, they could not possibly be assigned to any other person in the drama, any more than Hamlet's monologue could be spoken by Polonius. It is in this power of musically realizing a character—a power all but unknown in the serious opera of his day—that Gluck's genius as a dramatic composer is chiefly shown. After a short relapse into his earlier manner, Gluck followed up his Orpheus by a second classical music-drama (1767) named Alceste. In his dedication of the score to the grand-duke of Tuscany, he fully expressed his aims, as well as the reasons for his total breach with the old traditions. "I shall try," he wrote, "to reduce music to its real function, that of seconding poetry by intensifying the expression of sentiments and the interest of situations without interrupting the action by needless ornament. I have accordingly taken care not to interrupt the singer in the heat of the scene by a melodic interpolation, nor do I allow him to stop on a sonorous vowel, in the middle of a phrase, in order to show the nimbleness of a beautiful voice in a long cadence." Such theories, and the stern consistency with which they were carried out, were little to the taste of the pleasure-loving Viennese; and the success of Alceste, as well as that of Paris et Helena, which followed two years later, was not such as Gluck had desired and expected. He therefore eagerly accepted the chance of finding a home for his art in the centre of intellectual and more especially dramatic life, Paris. Such a chance was opened to him through the baili Le Blanc du Roulet, attaché of the French embassy at Vienna, and a musical amateur who entered into Gluck's ideas with enthusiasm. A classic opera for the Paris stage was accordingly projected, and the friends fixed upon Racine's Iphigénie en Aulide. After some difficulties, overcome chiefly by the intervention of Gluck's former pupil the dauphiness Marie Antoinette, the opera was at last accepted and performed at the Académie de Musique, on the 19th of April 1774.

The great importance of the new work was at once perceived by the musical amateurs of the French capital, and no controversy on the merits of Iphigénie ensued, in which some of the leading literary men of France took part. Amongst the opponents of Gluck were not only the admirers of Italian vocalization and sweetness, but also the adherents of the earlier French school, who refused to see in the new composer the legitimate successor of Lulli and Rameau. Marmontel, Laharpe and D'Alembert were his opponents, the Abbé Arnaud and others his enthusiastic friends. Rousseau took a peculiar position in the struggle.

In his early writings he is a violent partisan of Italian music, but when Gluck himself appeared as the French champion Rousseau acknowledged the great composer's genius; although he did not always understand it, as we may see when he suggested that in Alceste, "Divinités du Styx," perhaps the most majestic of all Gluck's arias, ought to have been set as a rondo. Nevertheless in a letter to Dr Burney, written shortly before his death, Rousseau gives a close and appreciative analysis of Alceste, the first Italian version of which Gluck had submitted to him for suggestions; and when, on the first performance of the piece not being received favourably by the Parisian audience, the composer exclaimed, "Alceste est tombée," Rousseau is said to have comforted him with the flattering bonmot, "Oui, mais de la tête du ciel." The composer received a still more personal character when Piccinni, a celebrated and by no means incapable composer, came to Paris as the champion of the Italian party at the invitation of Madame du Barry, who held a rival court to that of the young princess (see OPERA). As a dramatic controversy it suggests a parallel with the Wagnerian and anti-Wagnerian warfare of a later age; but there is no such radical difference between Gluck's and Piccinni's musical methods as the comparison would suggest. Gluck was by far the better musician, but his deficiencies in musical technique were such that few could easily perceive as easily as they could perceive Piccinni's. Both composers were remarkable masters of melody, and both had the gift of making incorrect music sound agreeable. Gluck's indisputable dramatic power might be plausibly dismissed as irrelevant by upholders of music for music's sake, even if Piccinni himself had not chosen, as he did, to assimilate every feature in Gluck's style that he could understand. The rivalry between the two composers was soon developed into a quarrel by the skilful engineering of Gluck's enemies. In 1777 Piccinni was given a libretto by Marmontel on the subject of Roland, to Gluck's intense disgust, as he had already the same opera at which there was a failure of an attempt to show his command of a lighter style by furnishing up some earlier works at the instigation of Marie Antoinette, inspired Gluck to produce his Armide, which appeared four months before Piccinni's Roland was ready, and raised a storm of controversy, admiration and abuse. Gluck did not anticipate Wagner more clearly in his dramatic reforms than in his caustic temper; and, as in Gluck's own estimation the difference between Armide and Alceste is that "l'un [Alceste] doit faire pleurer et l'autre faire éprover une tolérable sensation," he was extremely anxious to study of his work shown that where he had made Armide a sorceress instead of an enchantress, and that her part was "une criaillerie monotone et fatiguante." He replied to Laharpe in a long public letter worthy of Wagner in its venomous sarcasm and its tremendous value as an advertisement for its recipient.

Gluck's next work was Iphigénie en Tauride, the success of which finally disposed of Piccinni, who produced a work on the same subject at the same time and who is said to have acknowledged Gluck's superiority. Gluck's next work was Éroé et Narcisse, the comparative failure of which greatly disappointed him; and during the composition of another opera, Les Danaïdes, an attack of apoplexy compelled him to give up work. He left Paris for Vienna, where he lived for several years in dignified leisure, disturbed only by his declining health. He died on the 15th of November 1787. (F. H.; D. F. T.)

The great interest of the new dramatic aspect of Gluck's reforms is apt to overshadow his merit as a musician, and yet in some ways to idealize it. One is tempted to regard him as condoning for technical musical deficiencies by sheer dramatic power, whereas his contemporaries, whose work shows that where his dramatic power asserts itself there is no lack of musical technique. Indeed only a great musician could so reform opera as to give it scope for dramatic power at all. Where Gluck differs from the greatest musicians is in his absolute dependence on literature for his inspiration. Where his librettist failed him (as in his last complete work, Éroé et Narcisse), he could hardly write tolerably good music; and, even in the finest works of his French
period, the less emotional situations are sometimes set to music which has little interest except as a document in the history of the art. This must not be taken to mean merely that Gluck could not, like Mozart and nearly all the great song-writers, set good music to a bad text. Such inutility would prove Gluck's superior literary taste without casting a slur on his musicianship. But it points to a certain weakness as a musician that Gluck could not be inspired except by the more thrilling portions of his libretti. When he was inspired there was no question that he was the first and greatest writer of dramatic music before Mozart. To begin with, he could invent sublime melodies; and his power of producing great musical effects by the simplest means was nothing short of Handelian. Moreover, in his peculiar sphere he deserves the title generally accorded to Haydn of "father of modern orchestration." It is misleading to say that he was the first to use the timbre of instruments with a sense of emotional effect, for Bach and Handel well knew how to give a whole aria or whole chorus peculiar tone by means of a definite scheme of instrumentation. But Gluck did not treat instruments as part of a decorative design, any more than he so treated musical forms. Just as his sense of musical form is that of Philipp Emanuel Bach and of Mozart, so is his treatment of instrumental tone-colour a thing that changes with every shade of feeling in the dramatic situation, and not in accordance with any purely decorative scheme. To accompany an aria with strings, oboes and flutes, was, for example, a perfectly ordinary procedure; nor was there anything unusual in making the winds and instruments play in unison with the strings for the first part of the aria, and writing a passage for one or more of them in the middle section. But it was an unheard-of thing to make this passage consist of long appoggiaturas once every two bars in rising sequence on the first oboe, answered by deep pizzicato bass notes, while Agamemnon in despair cries: "J'entends retentir dans mon sein le cri plaintif de la nature."

Some of Gluck's most forcible effects are of great subtility, as, for instance, in Iphigénie en Tauride, where Orestes tries to reassure himself by saying: "Le calme retouche dans mon cœur," while the intensely agitated accompaniment of the strings belies him. Again, the sense of orchestral climax shown in the oracle scene in Alceste was a thing inconceivable in older music, and unsurpassed in artistic and dramatic spirit by any modern composer. Its influence in Mozart's Idomeneo is obvious at a first glance.

The capacity for broad melody always implies a true sense of form, whether that be developed by skill or not; and thus Gluck, in rejecting the convenient formalities of older styles of opera, was not, like some reformers, without something better to substitute for them. Moreover, in comparison with his librettist, achieved great skill in holding together entire scenes, or even entire acts, by dramatically apposite repetitions of short arias and choruses. And thus in large portions of his finest works the music, in spite of frequent full closes, seems to move pari passu with the drama in a manner which for naturalness and continuity is surpassed only by the finales of Mozart and the entire operas of Wagner. This is perhaps most noticeable in the second act of Orfeo. In its original Italian version both scenes that in Handel's that in Elysium, are indistinguishable, and the three songs into single lines. Though technically obvious, is aesthetically only a natural means of articulating the structure. The unity of the scene in Hades extends, in the original version, even to the key-system. This was damaged when Gluck had to transpose the part of Orpheus from an alto to a tenor in the French version. And here we have one of many instances in which the improvements his French experience enabled him to make in his great Italian works were not altogether unmixed. Little harm, however, was done to Orfeo which has not been easily remedied by transposing Orpheus's part back again; and in a suitable compromise between the two versions Orfeo remains Gluck's most perfect and inspired work. The emotional power of the music is such that the inevitable spoiling of the story by a happy ending has not the aspect of mere conventionality which it had in cases where the music produced no more than the normal effect upon 18th-century audiences. Moreover Gluck's genius was of too high an order for him to be less successful in portraying a sufficiently intense happiness than in portraying grief. He failed only in what may be called the business capacities of artistic technique; and there is less "business" in Orfeo than in almost any other music-drama. It was Gluck's first great inspiration, and his theories had not had time to take action in paper works. Alceste contains his grandest music and is also very free from weak pages; but in its original Italian version the third act did not give Gluck scope for an adequate climax. This difficulty so accentuated itself in the French version that after continual retouchings a part for Hercules was, in Gluck's absence, added by Gossec; and three pages of Gluck's music, dealing with the supreme crisis where Alceste is rescued from Hades (either by Apollo or by Hercules) were no longer required in performance and have been lost. The Italian version is so different from the French that it cannot help us to restore this passage, in which Gluck's music now stops short just at the point where we realize the full height of his power. The comparison between the Italian and French Alceste is one of the most interesting that can be made in the study of a musician's development. It would have been far easier for Gluck to write a new opera if he had not so justly attached to his second Italian masterpiece. So radical are the differences that in retranslating the French libretto into Italian for performance with the French music not one line of Calzabigi's original text can be retained. In Iphigénie en Aulide and Iphigénie en Tauride, Gluck shows that the controversies aroused by his methods began to interfere with his musical spontaneity. He had not, in Orfeo, gone out of his way to avoid rondo's, or we should have had no "Che faro senza Euridice." We read with a respectful smile Gluck's assurance to the baili Le Blanc du Roullet that "you would not believe Armide to be by the same composer" as Alceste. But there is no question that Armide is a very great work, full of melody, colour and dramatic point; and that Gluck has availed himself of every suggestion that his libretto afforded for orchestral and emotional effects of an entirely different type from any that he had attempted before. And it is hardly relevant to blame him for his inability to write erotic music. In the first place, the libretto is not erotic, though the subject would no doubt become so if treated by a modern poet. In the second place a conflict of passions (as, for instance, where Armide summon's the demons of Hate to exercise love from her heart, and her courage fails her as soon as they begin) has never, even in Alceste, been treated with more dramatic musical force. The work as a whole is unequal, partly because there is a little too much action in it to suit Gluck's methods; but, it shows, as does no other opera until Mozart's Don Giovanni, a sense of the development of characters, as distinguished from the mere presentation of them as already fixed.

In Iphigénie en Aulide and Iphigénie en Tauride, the very subtility of the finest features indicates a certain self-consciousness which, when inspiration is lacking, becomes mannerism. Moreover, in both cases the librettists, though skilfully managed, tell a rather more complicated story than those which Gluck himself went so painstakingly to treat; and, where inspiration fails, the musical technique becomes embarrassing, though without any corresponding naiveté. Still these works are immortal, and their finest passages are equal to anything in Alceste and Orfeo. Écho et Narcisse we must, like Gluck's contemporaries, regard as a failure. As in Orfeo, the pathetic story is ruined by a violent happy ending, but here this artistic disaster takes place before the pathos has had time to assert itself. Gluck had no opportunities in this work for any higher qualities, musical or dramatic, than prettiness; and with him beauty, without visible emotion, was indeed skin-deep. It is a pity that the plan of the great Pelletan-Damcke critical édition de luxe of Gluck's French operas forbids the inclusion of his Italian Paride e Elena, his third opera to Calzabigi's libretto, which was never given in a French version; for there can be no question that, whatever he owed to France, the
GLÜCKSBURG—GLÜCKSBUERG

period of his greatness began with his collaboration with Calzabigi.

GLÜCKSBURG, a town of Germany, in the Prussian province of Schleswig-Holstein, romantically situated among pine woods on the Flensburg Fjord off the Baltic, 6 m. N.E. from Flensburg by rail. Pop. (1905) 15,511. It has a Protestant church and some small manufactures and is a favourite sea-bathing resort. The castle, which occupies the site of a former Cistercian monastery, was, from 1622 to 1779, the residence of the dukes of Holstein-Sonderburg-Glücksburg, passing then to the king of Denmark and in 1866 to Prussia. King Frederic VII of Denmark died here on the 15th of November 1863.

GLÜCKSTADT, a town of Germany, in the Prussian province of Schleswig-Holstein, on the right bank of the Elbe, at the confluence of the small river Rhin, and 28 m. N.W. of Altona, on the railway from Itzehoe to Elmsbhor. Pop. (1905) 6,886. It has a Protestant and a Roman Catholic church, a handsome town-hall (restored in 1873-1874), a gymnasium, a provincial prison and a penitentiary. The inhabitants are chiefly engaged in commerce and fishing; but the frequent losses from inundations have greatly retarded the prosperity of the town. Glückstadt was founded by Christian IV. of Denmark in 1617, and fortified in 1620. It soon became an important trading centre. In 1627-28 it was besieged for fifteen weeks by the imperialists under Tilly, without success. In 1814 it was blockaded by the allies and capitated, whereupon its fortifications were demolished. In 1830 it was made a free port. It came into the possession of Prussia together with the rest of Schleswig-Holstein in 1866.

S. Lucht, Glückstadt. Beiträge zur Geschichte dieser Stadt (Kiel, 1854).

GLUCOSE (from Gr. γλυκύς, sweet), a carbohydrate of the formula C_{6}H_{12}O_{6}; it may be regarded as the aldehyde of sorbite. The name is applied in commerce to a complex mixture of carbohydrates obtained by boiling starch with dilute mineral acids; in chemistry, it denotes, with the prefixes d, L and d+L (or d), the dextro-rotatory, laevo-rotatory and inactive forms of the definite chemical compound defined above. The d modification is of the commonest occurrence, the other forms being only known as synthetic products; for this reason it is usually termed glucose, simply; alternative names are dextrose, grape sugar and diacetic sugar, in allusion to its right-handed optical rotation, its occurrence in large quantity in grapes, and in the urine of diabetic patients respectively. In the vegetable kingdom glucose occurs, always in amixture with fructose, in many fruits, especially grapes, cherries, bananas, &c.; and in combination, generally with phenols and aldehydes belonging to the aromatic series, it forms an extensive class of compounds termed glucosides. It appears to be synthesized in the plant tissues from carbon dioxide and water, formaldehyde being an intermediate product; or it may be a hydrolytic product of a glucoside or of a polysaccharose, such as cane sugar, starch, cellulose, &c. In the plant it is freely converted into more complex sugars, poly-saccharoses and also proteids. In the animal kingdom, also, it is very widely distributed, being sometimes a normal and sometimes a pathological constituent of the fluids and tissues; in particular, it is present in large amount in the urine of those suffering from diabetes, and may be present in nearly all the body fluids. It also occurs in honey, the white appearance of candied honey being due to its separation.

Pure d-glucose, which may be obtained synthetically (see SUGAR) by adding crystallized cane sugar to a mixture of 80% alcohol and 5% volume of fuming hydrochloric acid so long as it dissolves on shaking, crystallizes from water or alcohol at ordinary temperatures in nodular masses, composed of minute six-sided plates, and containing one molecule of water of crystallization. This product melts at 86° C., and becomes anhydrous when heated to 110° C. The anhydrous compound can also be prepared as yellow crusts melting at 146° by crystallizing concentrated aqueous solutions at 30° to 35°. It is very soluble in water, but only slightly soluble in strong alcohol. Its taste is somewhat sweet, its sweetening power being estimated at from 3/4 to 7/8 that of cane sugar. When heated to above 200° it turns brown and produces caramel, a substance possessing a bitter taste, and used, in its aqueous solution or otherwise, under various trade names, for colouring confectionery, spirits, &c. The specific rotation of the plane of polarized light by glucose solutions is characteristic. The specific rotation of a freshly prepared solution is 195°, but this value gradually diminishes to 53°-57°, 24 hours sufficing for the transition in the case of a few minutes. The solution is boiled. This phenomenon has been called mutarotation by T. M. Lowry. The specific rotation also varies with the concentration; this is due to the dissociation of complex molecules into simpler ones, a view confirmed by cryoscopic measurements.

Glucose may be estimated by means of the polarimeter, i.e. by determining the rotation of the plane of polarization of a solution, or, chemically, by taking advantage of its property of reducing alkaline copper solutions. If a glucose solution be added to copper sulphate and much alkalai added, a yellowish-red precipitate of cuprous hydrate separates, slowly in the cold, but immediately when the liquid is heated; this precipitate rapidly turns red owing to the formation of cuprous oxide. In 1846 L. C. A. Barreswil found that a strongly alkaline solution of copper sulphate and potassium sodium tartrate (Rochelle salt) remained unchanged on boiling, but yielded an immediate precipitate of red cuprous oxide when a solution of glucose was added. He suggested that the method was applicable for quantitatively estimating glucose, but its acceptance only followed the publication of Fehling's investigation. Fehling's solution is prepared by dissolving separately 34.560 grammes of copper sulphate, 173 grammes of Rochelle salt, and 71 grammes of caustic soda in water, mixing and making up to 1000 ccs.; 10 ccs. of this solution is completely reduced by 0-05 grammes of hexose. Volumetric methods are used, but the uncertainty of the end of the reaction has led to the suggestion of specific indicators, or of determining the amount of cuprous oxide gravimetrically.

Chemistry.—In its chemical properties glucose is a typical oxaldehyde or aldose. The aldohexose group reacts with hydroxylic acid to produce two stereo-isomeric cyanhydrins; this isomerism is due to the conversion of an originally non-asymmetric carbon atom into an asymmetric one. The cyanhydrin is hydrolyzable to an acid, the lactone of which may be reduced by sodium amalgam to a form of non-asymmetric sugar containing seven carbon atoms. By repeating the process a non-fermentable glucose-octose and a fermentable glucosonone may be prepared. The aldohexose group reacts with formaldehyde to form two phenylhydrazones; under certain conditions a hydroxylic acid, and the aldohexose group is oxidized and glucosazone is produced; this glucosazone is decomposed by hydrochloric acid into phenyl hydratose and the keto-sugar, glycerose. These transformations are fully discussed in the article SUGAR. On reduction glucose appears to yield the hexahydrate alcohol d-sorbit, and on oxidation d-glucic and d-saccharic acids. Alkalis partially convert it into d-mannose and d-fructose. Baryta and lime yield saccharates, e.g., C_{12}H_{22}O_{11}BaO, precipitable by alcohol.

The constitution of glucose was established by H. Kiliani in 1885-1887, who showed it to be C_{6}H_{12}O_{6}-CHO. The subject was taken up by Emil Fischer, who succeeded in synthesizing glucose, and also several of its stereo-isomers, there being 16 according to the Le Bel-van't Hoff theory (see Stereo-Isomerism and Stereo-Isomerism). This open chain structure is challenged in the views put forward by T. M. Lowry and E. F. Armstrong. In 1895 C. Tanret showed that glucose existed in more than one form, and he isolated a & y varieties with specific rotations of 102°, 55°-57° and 22°. It is now agreed that the 2a variety is a mixture of a & y. This discovery explained the mutarotation of glucose. In a fresh solution a-glucose only exists, but on standing it is slowly transformed to d-glucose, being reached when the a and y forms are present in the ratio 0.56:0.432 (Tanret, Zett. physiol. Chem., 1898, 53, p. 106). Formerly it was convenient to refer to these two forms as a and b. Lowry and Armstrong represent these by the following spatial formulae, which postulate a-oxidic structure, and 5 asymmetric carbon atoms, i.e. one more than in the Fischer formulae. These formulae are supported by many considerations, especially by the selective
GLUCOSIDE, in chemistry, the generic name of an extensive group of substances characterized by the property of yielding a sugar, more commonly glucose, when hydrolysed by purely chemical means, or decomposed by a ferment or enzyme. The name was originally given to vegetable products of this nature, in which the other part of the molecule was, in the greater number of cases, an aromatic aldehydic or phenolic compound (exceptions are sinigrin and jalap or scammony). It has now been extended to include synthetic others, such as those obtained by acting on alcoholic glucose solutions with hydrochloric acid, and the polysaccharides, e.g., cane sugar, and to be ethers also. Although glucose is the commonest sugar present in glucosides, many are known which yield rhamnose or iso-dulcite; these may be termed pentosides. Much attention has been given to the non-sugar parts of the molecules; the constitutions of many have been determined, and the compounds synthesized; and in some cases the preparation of the synthetic glucoside effected.

The simplest glucosides are the alkyl esters which E. Fischer (Ber., 28, pp. 1131, 3081) obtained by acting with hydrochloric acid on alcoholic glucose solutions. A better method of preparation is due to E. F. Armstrong and S. L. Courtaud (Proc. Phys. Soc., 1905, July 1), who dissolve solid anhydro saccharose in methyl alcohol containing hydrochloric acid. A mixture of α- and β-glucose result, which are then etherified, and if the solution be neutralized before the β-form isomerizes and the solvent removed, a mixture of the α- and β-methyl ethers is obtained. These may be separated by the action of suitable ferments. Fischer found that these ethers did not reduce Fehling's solution, neither did they combine with phenyl hydrazine at 100°; they appear to be stereo-isomeric γ-oxidic compounds of the formulae I., II., etc.

The difference between the α- and β-forms is best shown by the selective action of enzymes. Fischer finds that an enzyme occurring in yeast cells, hydrolysed α-glucosides but not the β, while emulsin, an enzyme occurring in bitter almonds, hydrolyses the β but not the α. The ethers of non-fermentable sugars are themselves non-fermentable. By acting with these enzymes on the natural glucosides, it is found that the majority are of the β-form; e.g., emulsin hydrolyses salicin, helicin, asculin, coniferin, &c.

Classification of the glucosides is a matter of some difficulty. One based on the chemical constitution of the non-glucose part of the molecules has been proposed by Unney, who framed four groups: (1) members of the glucose group; (2) members of the fructose group; (3) members of the saccharic group; (4) members of the galactose group. A group may also be made to include the cyano-genetic glucosides, i.e., those containing prussic acid. J. J. L. van Rijn (Diet. Glycase, 1900) follows a botanical classification, which has several advantages; in particular, plants of allied genera contain similar compounds. In this article the chemical classification will be followed. Only the more important compounds will be noticed, the reader being referred to van Rijn (loc. cit.) and to Belstein's Handbuch der organischen Chemie for further details.

1. Ethylene Derivatives.—These are generally mustard oils, and are characterized by a burning taste; their principal occurrence is in mustard and Tropaeolum seeds. Sinigrin or the potassium salt of myronic acid, CaH4NSO3K.H2O, occurs in black pepper and in horse-radish root. Hydrolysis with baryta, or decomposition by the ferment myrosin, gives glucose, allyl mustard oil and potassium bisulphite. Saligenin, C6H10O5S, also occurs in white pepper, and also possesses the mustard oil, H2O, H2O, H2O, and saligenin, a compound of choline and sinapinic acid. Jalapin or scammonin, C6H12O6, occurs in scammony; it hydrolyses to glucose and salicylaldehyde. The formulae of sinigrin, saligenin, scammony and jalapin are:

\[
\text{C}_6\text{H}_{10}\text{O}_5\text{S} \quad \text{C}_6\text{H}_{10}\text{O}_5\text{S} \quad \text{C}_6\text{H}_{12}\text{O}_6 \\
\text{C}_6\text{H}_{12}\text{O}_6 \quad \text{C}_6\text{H}_{12}\text{O}_6 \quad \text{C}_6\text{H}_{12}\text{O}_6
\]

2. Benzene Derivatives.—These are generally oxygen and oxyaldehydic compounds, Arbutin, C6H12O5, which occurs in bearberry along with methyl arbutin, hydrolyses to hydroquinone and glucose. Phenol, usually known as an antiseptic and diuretic; the benzoyl derivative, celloctein, has been used for tuberculosis. Salicin, also termed saligenin and glucose, C6H12O6, occurs in the willow. The enzymes tyltase and emulsin convert it into glucose and saligenin, ortho-xybenzyolalcohol, HOC=HOC=OH. Oxidation gives the aldehyde helicin. Populin, C6H12O6, occurs in the leaves and bark of Populus tremula, is benzoyl salicin.

\[
\text{C}_6\text{H}_{12}\text{O}_5 \quad \text{C}_6\text{H}_{12}\text{O}_5 \quad \text{C}_6\text{H}_{12}\text{O}_6 \\
\text{CHO} \quad \text{CHO} \quad \text{CHO}
\]

Jalapaldehyde (Kramer)
C₆H₄O₆(2), which hydrolyses to rhamnose and hesperetin, C₆H₃O₆, the phloroglucin ester of meta-oxy-para-methoxybenzilic acid or isolaconic acid, C₆H₃O₆. We may here include various plant pigments and browning agents. Ascending C₆H₄O₆, occurring in horse-chestnut and daphnium, occurring in Daphne alpina, are isomeric; the former hydrolyses to glucose and asculein (4-5-dioxy-
combinations, the latter to glucose and daphnin (3,4-dioxy-
ypyrone). Rhamnatin, a splitting product of the glucosides of
Rhamnus, is monomethyl quercitin; fisetin, from Rhu cotinus; to the
chrysin is phenyl-dioxybenzo-7-pyron. Supposing a sugar that in its own system, a
the non-sugar part of the molecule) are valuable glue-forming
substances; most of these, e.g. Fraxin, C₆H₄O₆, occurring in Fraxinus excelsior, and with asculein in horse-
formulations, hydrolyses to glucose and fraxetin, the mono-
methyl ester of a trioxymorcin. Flavone or benzopyrazoly-
derivatives are very numerous; in many cases they (or the non-
sugar part of the molecule) are valuable glue-forming
dyes. Quercitin, C₆H₄O₆, is a yellow dye-stuff found in
Vegetus tinctoria; it hydrolyses to rhamnose and quercitin, a
dioxy-dioxybenzo-7-pyron. Rhamnatin, a splitting product of the
Rhamnus, is monomethyl quercitin; fisetin, from Rhu cotinus; chrysin is
ignatios and amygdalin, which occurs in bitter almonds. The enzyme maltase decomposes it into
and mannite, which latter is broken down by 
the intestinal amylase, which also produces amylagold directly into these compounds without the intermediate formation of mannite. 
Several other glucosides of this nature have been isolated. The saponins are a group of substances characterized by forming a bitter taste with water; 
they occur in soap-bark (q.v.). Mention may also be made of indican, 
the glucoside of the indigo plant; this is hydrolysed by the indigo 
ferment, indulin, to indoxyl and indigluin.

**GLUE**

GLUE (from the O. Fr. *glue*, birde-lime, from the Late Lat. *gelatun, glus, glue*), a valuable agglutinant, consisting of impure gelatin and widely used as an adhesive medium for wood, leather, paper and similar substances. Glues and gelatins merge into one another by imperceptible degrees. The difference is conditioned by the degree of purity: the more impure form is termed glue and is only used as an adhesive, the purer forms, termed gelatin, have other applications, especially in culinary operations and confectionery. Referring to the article GELATIN for a general account of this substance, it is only necessary to state here that gelatigenous or glue-forming tissues occur in the bones, skins and intestines of all animals, and that by extraction with hot water these agglutinating materials are removed, and the solution on evaporating and cooling yields a jelly-like substance —gelatin or glue.

Glues are most conveniently classified according to their sources: bone glue, skin glue and fish glue; these may be regarded severally as impure forms of bone gelatin, skin gelatin and isinglass.

**Bone Glue.** —For the manufacture of glue the bones are supplied fresh or after having been used for making soups; Indian and South American bones are unsuitable, since, by reason of their previous treatment with steam, both their fatty and glue-forming constituents have been already removed (to a great extent). On the average, fresh bones contain about 50% of mineral matter, including calcium and magnesium phosphates, about 12% of moisture and fat, the remainder being other organic matter. The mineral matter reappears in commerce chiefly as artificial manure; the fat is employed in the candle, soap and glycerin industries, while the other organic matter supplies glue.

The separation of the fat, or "de-grassing of the bones" is effected (1) by boiling the bones with water in open vessels; (2) by treatment with steam under pressure; or (3) by means of solvents. The last process is superseding the first two, which give a poor return of fat—a valuable consideration—and involve the loss of a certain amount of glue. Many solvents have been proposed; the greatest commercial success appears to attend Scottish shale oil and natural petroleum (Russian or American) boiling at about 100° C. The vessels in which the extraction is carried out consist of upright cylindrical boilers, provided with manholes for charging, a false bottom on which the bones rest, and with two steam-coils—one for heating only, the other for leading in "live" steam. There is a pipe from the top of the vessel leading to a condensing plant. The vessels are arranged in batteries. In the actual operation the boiler is charged with bones, solvents are run in, and the oil is distilled heated by means of the dry coil; the spirit distils over, carrying with it the water present in the bones; and after a time the extracted fat is run off from discharge cocks in the bottom of the extractor.

A fresh charge of solvent is introduced, and the cycle repeated; this is repeated a third and fourth time, after which the bones contain only about 0.5% of fat, and a little of the solvent, which is removed by blowing in live steam under 70 to 80 lb pressure. The de-grased bones are now cleansed from all dirt and flesh by rotation in a horizontal cylindrical drum covered with stout wire gauge. The attrition accompanying this motion suffices to remove the loosely adherent matter, which falls through the meshes of the gauge; this meal contains a certain amount of glue-forming matter, and is generally passed through a finer mesh, the residuum being worked up in the glue-house, and the flour which passes through being sold as a bone-meal, or used as a manure.

The bones, which now contain 5 to 6% of glue-forming nitrogen and about 60% of calcium phosphate, are next treated for glue. The most economical process consists in steaming the bones without pressure in the presence of about 10% of water. The bones, which are now freed from impurities, are introduced into upright cylindrical boilers fitted with false bottoms.

The glue-liquors collect beneath the false bottoms, and when of a strength equal to about 20% dry glue they are run off to the clarifiers. The first runnings contain about 65 to 70% of the total glue; a second steaming extracts another 25 to 30%. For clarifying the solutions, ordinary alum is used, one part being used for 200 parts of dry glue. The alum is added to the hot liquors, and the temperature raised to 100°; it is then allowed to settle, and the surface scum removed by filtering through coarse cotton or fine wire.
GLUTARIC ACID

From such heterogeneous materials; one blending may be a success and another a failure. The raw material has been divided into three great divisions: (1) sheep pieces and fleshings (ears, &c.); (2) ox fleshings and trimmings; (3) ox hides and pieces; the best glue is obtained from a mixture of the hide, ear and face dippings of the ox and calf. The raw material or “stock” is first steeped for from two to ten weeks, according to its nature, in wood vats or pits with lime water, or steeped carefully dried and stored. The object of the lime steeping is to remove any blood and flesh which may be attached to the skin, and to form a lime soap with the fatty matter present. The “scrobs” or glue pieces, which may be kept a long time without undergoing change, are washed with a dilute hydrochloric acid to remove all lime, and then very thoroughly with water; they are now allowed to drain and dry. The skins are then placed in hemp nets and introduced into an open boiler which has a false bottom, and a tap by which liquid may be run off. As the boiling proceeds test quantities of liquid are from time to time examined, and when a sample is found on cooling to form a stiff jelly, which happens when it contains about 32% dry glue, it is ready to draw off. The solution is then run to a clarifier, in which a temperature sufficient to keep it fluid is maintained, and in this way any impurity is permitted to subside. The glue solution is then run into wooden troughs or coolers in which it sets to a firm jelly. The cakes are removed as in the case of bone glue (see above), and, having been placed on nets, are, in the Scottish practice, dried by exposure to open air. This simple method has many disadvantages: on a hot day the cake may become unshapely, or melt and slip through the net, or dry so rapidly as to crack; a frost may produce fissures, while a fog or mist may precipitate moisture on the surface and occasion a mouldy appearance. The surface of the cake, which is generally dull after drying, is polished by washing with water. The practice of boiling, clarification, cooling and drying, which has already described in the case of bone glue, has been also applied to the separation of skin glue.

Fish Glue.—Whereas isinglass, a very pure gelatin, is yielded by the sounds of a limited number of fish, it is found that all fish offal yields a glue possessing considerable adhesive properties. The manufacture consists in thoroughly washing the offal with water, and then discharging it into extractors with live steam. After digestion, the liquid is run off, allowed to stand, the upper oily layer removed, and the lower gluey solution clarified with alum. The liquid is then filtered, concentrated in open vats, and bleached with sulphur dioxide.1 Fish glue is a light-brown viscous liquid which has a distinctly disagreable odour and an acrid taste; these disadvantages to its use are avoided if it be boiled with a little water and 4% of sodium phosphate, and 0.025% of saccharine added.

Properties of Glue.—A good quality of glue should be free from all specks and grit, have a uniform, light brownish-yellow, transparent appearance, and should break with a glassy fracture. Steeped for some time in cold water it softens and swells up without dissolving, and when again dried it ought to resume its original properties. Under the influence of heat it entirely dissolves in water, forming a thin syrupy fluid with a not disagreeable smell. The adhesive of different qualities of glue varies; thus in the best glue the gum is dissolved by very hot water and the glue, broken in small pieces, in water until they are quite soft, and then placing them with just sufficient water to effect solution in the glue-pot. The hotter the glue, the better the joint; remelted glue is not so strong as the freshly prepared, and newly manufactured glue is inferior to that which has been long in stock. It is therefore seen that many factors enter into the determination of the cohesive power of glue; a well-prepared joint may, under favourable conditions, withstand a pull of about 700 lb per sq. in. The following table, after Kilmarsch, shows the holding power of glued joints with various kinds of woods.

Special Kinds of Glues, Cement, &c.—By virtue of the fact that the combined “glue” is free from and gasless, it may or may not contain gelatin, there will now be given an account of some special preparations. These may be conveniently divided into: (1) liquid glues, mixtures containing gelatin which do not readily settle at ordinary temperatures, but readily precipitate when at low temperatures; (2) water-proof glues, including mixtures containing gelatin, and also the “marine glues,” which contain no glue; (3) glues or cements for special purposes, e.g., for printing paper; (4) adhesives for cementing dissimilar materials, such as paper and leather to iron.

Liquid Glues.—The demand for liquid glues is mainly due to the disadvantages—the necessity of dissolving and using while hot—of ordinary glues. They are generally prepared by adding to a warm glue solution some reagent which destroys the property of gelatinizing. The reagents in common use are acetic acid; magnesium chloride, used for a glue employed by printers; hydrochloric acid and zinc sulphate; nitric acid and lead sulphate; and phosphoric acid and ammonium carbonate.

Water-proof Glues.—Numerous recipes for water-proof glues have been published. An excellent one, perhaps, is obtained by dissolving in four-fifths its weight of linseed oil, furnishes a good water-proof adhesive; linseed oil varnish and litharge, added to a glue solution, is also used; resin added to a glue solution in water, and afterwards diluted with turpentine, is another; the best glue is said to be obtained by dissolving one part of glue in one and a half parts of water, and then adding to the resulting glue solution 10% of some gums, and tannic acid, confer the same property on glue solutions. The “marine glues” are solutions of india-rubber, shellac or asphaltum, or mixtures of these substances, in benzene or toluene. Jeffrey’s marine glue is formed by dissolving india-rubber in four parts of benzene and adding two parts of shellac; it is extensively used, being easily applied and drying rapidly and hard. Another water-proof glue which is commonly employed is obtained by heating linseed oil with five parts of quicklime; when cold it forms a hard mass, which melts on heating like ordinary glue.

Special Glues.—There are innumerable recipes for adhesives specially applicable to certain substances and under certain conditions. For repairing glass, ivory, &c. isinglass (i.e.), which may be replaced by fine glue, yields valuable cements; bookbinders employ an elastic glue obtained from an ordinary glue solution and gelatin, the water being expelled by heating; an efficient cement for mounting photographs is obtained by dissolving glue in ten parts of alcohol and adding one part of glycerin; portable or mouth glue—so named because it melts in the mouth—is prepared by dissolving one part of sugar in a solution of four parts of glue. An india-rubber substitute is obtained by adding sodium tungstate and hydrochloric acid to a strong glue solution; this preparation may be rolled out when heated to 100°.

For further details see Thomas Lambert, Glue, Gelatine and their Allied Products (London, 1905); R. L. Fernbach, Glues and Gelatines (1925); H. C. Stanadge, Adgelants of all Kinds for all Purposes (1907).

GLUTARIC ACID, or Normal Pyrotratartic Acid, H₂O·C₂H₅·C₂H₅·C₂H₅·CO₂H, an organic acid prepared by the reduction of α-oxyglutaric acid with hydriodic acid, by reducing glutaric acid, H₂O·C₂H₅·CH·CH·CO₂H, with sodium amalgam, by conversion of trimethylene bromide into the cyanide and hydrolysis of this compound, or from acetocetic ester, which, in the form of its sodium derivative, condenses with β-hydroxy acetic ester to form fonbes, from which the glue acid is obtained by hydrolysis. It is also obtained when sebacic, stearic and oleic acids are oxidized with nitric acid. It crystallizes in large monoclinic prisms which melt at 97.5° C, and distils between 30° and 304° C, practically without decomposition. It is soluble in water, alcohol and ether. By long heating the acid is converted into its anhydride, which, however, is obtained more readily by heating the silver salt of the acid with acetyl chloride. By distillation of the ammonium salt glutarimide, CH₂(C₂H₅)₂CNH, is obtained; the latter is a little crystalline melting at 152° and 154° C, and subliming unchanged.

Of the alkyl glutaric acids, see C. Hell (Ber., 1889, 22, pp. 48, 60), C. A. Bischoff (Ber., 1891, 24, p. 1041), K. Auwers (Ber., 1891, 24, p. 1923) and W. H. Perkin, junr. (Journ. Chem. Soc., 1896, 69, p. 268).
GLUTEN, a tough, tenacious, ductile, somewhat elastic, nearly tasteless and greyish-yellow albuminous substance, obtained from the flour of wheat by washing in water, in which it is insoluble. Gluten, when dried, loses about two-thirds of its weight, becoming brittle and semi-transparent; when strongly heated it crackles and swells, and burns like feather or horn. It is soluble in strong acetic acid, and in caustic alkalis, which latter may be used for the purification of starch in which it is present. When treated with 10-15% solution of hydrochloric acid it swells up, and at length forms a liquid resembling a solution of albumin, and laevorotatory as regards polarized light. Moisten with water and exposed to the air gluten putrefies, and evolves carbon dioxide, hydrogen and sulphurated hydrogen, and in the end is almost entirely resolved into a liquid, which contains leucin and ammonium phosphate and acetate. On analysis gluten shows a composition of about 53% of carbon, 7% of hydrogen, and nitrogen 15 to 16%, besides oxygen, and about 1% of sulphur, and a small quantity of inorganic matter. According to H. Ritthausen it is a mixture of glutenacetin (liebig's vegetable fibrin), glutenälbin, hyaladion (banzlein), gluten or vegetable gelatin, and mucadion, which are all closely allied to one another in chemical composition. It is the gliadin which confers upon gluten its capacity of cohering to form elastic masses, and of separating readily from associated starch. In the so-called gluten of the flour of barley, rye, and maize, this body is absent (H. Ritthausen and U. Kreusler). The gluten yielded by wheat which has undergone fermentation or has been made to sprout is devoid of toughness and elasticity. These qualities can be restored to it by kneading with salt, lime-water or alum. Gluten is employed in the manufacture of gluten bread and biscuits for the diabetic, and of chocolate, and also in the adulteration of tea and coffee. For making bread it must be used fresh, as otherwise it decomposes, and does not knead well. Granulated gluten is a kind of vermicelli, made in some starch manufactories by mixing fresh gluten with twice its weight of flour, and granulating by means of a cylinder and contained stirrer, each armed with spikes, and revolving in opposite directions. The process is completed by the drying and sifting of the granules.

GLUTTON, or WOLVERINE (Gulo luscus), a carnivorous mammal belonging to the Mustelidae, or weasel family, and the sole representative of its genus. The legs are short and stout, with large feet, the toes of which terminate in strong, sharp claws considerably curved. The mode of progression is semiplantigrade. In size and form the glutton is something like the badger, measuring from 2 to 3 ft. in length, exclusive of the thick bushy tail, which is about 8 in. long. The head is broad, the eyes are small and the back arched. The fur consists of an undercoat of short woolly hair, mixed with long straight hairs, to the abundance and length of which on the sides and tail the creature owes its shaggy appearance. The colour of the fur is blackish-brown, with a broad band of chestnut stretching from the shoulders along each side of the body, the two meeting near the root of the tail. Unlike the majority of arctic animals, the fur of the glutton in winter grows darker. Like other Mustelidae, the glutton is provided with anal glands, which secrete a yellowish fluid possessing a highly fetid odour. It is a boreal animal, inhabiting the northern regions of both hemispheres, but most abundant in the circumpolar area of the New World, where it occurs throughout the British provinces and Alaska, being specially numerous in the neighbourhood of the Mackenzie river, and extending southwards as far as New York and the Rocky Mountains. The Wolverine is a voracious animal, and also one with an inquisitive disposition. It feeds on grouse, the smaller rodents and foxes, which it digs from their burrows during the breeding-season; but want of activity renders it dependent for most of its food on dead carcasses, which it frequently obtains by methods that have made it peculiarly obnoxious to the hunters and trappers. Should the hunter, after succeeding in killing his game, leave the carcass insufficiently protected for more than a single night, the glutton, whose fear of snares is sufficient to prevent him from touching it during the first night, will, if possible, get at and devour what he can on the second, hiding the remainder beneath the snow. It annoys the trapper by following up his lines of marten-traps, often extending to a length of 40 to 50 m., each of which it enters from behind, extracting the bait, pulling up the traps, and devouring or concealing the entrapped martens. So persistent is the glutton in this practice, when once it discovers a line of traps, that its extermination along the trapper's route is a necessary preliminary to the success of his business. This is no easy task, as the glutton is too cunning to be caught by the methods success-fully employed on the other members of the weasel family. The trap generally used for this purpose is made to resemble a cache, or hidden store of food, such as the Indians and hunters are in the habit of forming, the discovery and rifting of which is one of the glutton's most congenial occupations—the bait, instead of being paralyzed as in most traps, being carelessly concealed, to huff the knowing beast's suspicions. One of the most prominent characteristics of the wolverine is its propensity to steal and hide things, not merely food which it might afterwards need, or traps which it regards as enemies, but articles which cannot possibly have any interest except that of curiosity. The following instance of this is quoted by Dr E. Coues in his work on the Fur-bearing Animals of North America: "A hunter and his family having left their lodge unguarded during their absence, on their return found it completely gutted—the walls were there, but nothing else. Blankets, guns, kettles, axes, cans, knives and all the other paraphernalia of a trapper's tent had vanished, and the tracks left by the beast showed who had been the thief. The family set to work, and, by carefully following up all his paths, recovered, with some trifling exceptions, the whole of the lost property." The cunning displayed by the glutton in unravelling the snares set for it forms at once the admiration and despair of every trapper, while its great strength and ferocity render it a dangerous antagonist to animals larger than itself, occasionally including man. The rutting-season occurs in March, and the female, secure in her burrow, produces her young—four or five at a birth—in June or July. In defence of these she is exceedingly bold, and the Indians, according to Dr Coues, "have been heard to say that they would sooner encounter a she-bear with 'her cubs than a carcajou (the Indian name of the glutton) under the same circumstances." On catching sight of its enemy, man, the wolverine before finally determining on flight, is said to sit on its haunches, and, in order to get a clearer view of the danger, shake its eyes with one of its fore-paws. When pressed for food it becomes fearless, and has been known to come on board an ice-bound vessel, and in presence of the crew seize a can of meat. The glutton is valuable for its fur, which, when several skins are sewn together, forms elegant heath and carriage rugs.

GLYCAS, MICHAEL, Byzantine historian (according to some a Sicilian, according to others a Corfiote), flourished during the 12th century A.D. His chief work is his Chronicle of events
GLYCERIN, GLYCERINE or GLYCEROL (in pharmacy Glycerinum) (from Gr. γλυκός, sweet), a trihydric alcohol, trihydroxypropane, \( \text{CH}_3(\text{OH})_3 \). It is obtainable from most natural fatty bodies by the action of alkalis and similar reagents, whereby the fats are decomposed, water being taken up, and glycerin being formed together with the alkaline salt of some particular acid (varying with the nature of the fat). Owing to their possession of this common property, these natural fatty bodies and others of a similar constitution, behave in the same way when treated with alkalis, are known as glycerides. In the ordinary process of soap-making the glycerin remains dissolved in the aqueous liquor from which the soap is separated.

Glycerin was discovered in 1779 by K. W. Scheele and named Ölsäure (principe des huiles)—sweet principle of oils, and more fully investigated subsequently by M. E. Chevreul, who named it glycerin, M. P. E. Berthelot, and many other chemists, from whose researches it results that glycerin is a trihydric alcohol indicated by the formula \( \text{CH}_3(\text{OH})_3 \), the natural fats and oils, and the glycerides generally, being substances of the nature of compound esters formed from glycerin by the replacement of the hydrogen of the \( \text{OH} \) groups by the radicals of certain acids, called for that reason "fatty acids." The relationship of these glycerides to glycerin is shown by the series of bodies formed from glycerin by replacement of hydrogen by "stearyl" \( (\text{C}_18\text{H}_{35})_2\text{O} \), the radical of stearic acid \( (\text{C}_17\text{H}_{35})_2\text{O} \):—

\[
\begin{align*}
\text{CH}_3&-\text{OH} & \text{CH}_3-\text{O}(\text{C}_18\text{H}_{35})_2 \text{O} \\
\text{CH}_2-\text{OH} & \text{CH}_2-\text{O}(\text{C}_17\text{H}_{35})_2 \text{O} \\
\text{CH}_2-\text{OH} & \text{CH}_2-\text{O}(\text{C}_16\text{H}_{35})_2 \text{O} \\
\end{align*}
\]

The process of saponification may be viewed as the gradual progressive transformation of tristearin, or some analogously constituted substance, into distearin, monostearin and glycerin, or as the similar transformation of a substance analogous to distearin or to monostearin into glycerin. If the reaction is brought about in presence of an alkali, the acid set free becomes transformed into the corresponding alkaline salt; but if the decomposition is effected without the presence of an alkali (i.e. by means of water alone or by an acid), the acid set free and the glycerin are obtained together in a form which usually admits of their ready separation. It is noticeable that with few exceptions the fatty and oily matters occurring in nature are substances analogous to tristearin, i.e. they are trihydric replaced glycerins. Amongst these glycerides may be mentioned the following:

- **Tristearin**—\( \text{C}_18\text{H}_{36}(\text{O}-\text{C}_18\text{H}_{35})_2 \). The chief constituent of hard animal fats, such as beef, mutton, tallow, &c.; also contained in many softest fats in smaller or greater quantity.
- **Triolein**—\( \text{C}_18\text{H}_{36}(\text{O}-\text{C}_17\text{H}_{35})_2 \). Largely present in olive oil and other saponifiable vegetable oils and soft fats; also present as animal fats, especially hog’s lard.
- **Tripalmitin**—\( \text{C}_16\text{H}_{36}(\text{O}-\text{C}_16\text{H}_{35})_2 \). The chief constituent of palm oil; also contained in greater or less quantities in human fat, olive oil, and other animal and vegetable fats.
- **Tristerculin**—\( \text{C}_14\text{H}_{36}(\text{O}-\text{C}_14\text{H}_{29})_2 \). The main constituent of castor oil.

Other analogous glycerides are apparently formed in greater or smaller quantity in certain other oils. Thus in cows’ butter, tributyrin, \( \text{C}_17\text{H}_{34}(\text{O}-\text{C}_7\text{H}_{15})_2 \), and the analogous glycerides of other readily volatile acids closely resembling butyric acid, are present in small quantity; the production of these acids on saponification and distillation with dilute sulphuric acid is utilized as a test of a purity of butter as sold. **Tricinol**—\( \text{C}_18\text{H}_{36}(\text{O}-\text{C}_2\text{H}_4\text{O})_2 \), is apparently contained in cod-liver oil. Some other glycerides isolated from natural sources are analogous in composition to tristearin, but with this difference, that the three radicals which replace hydrogen in glycerin are not all identical; thus kephalin, myelin and lecithin are glycerides in which two hydrogens are replaced by fatty acid radicals, and the third by a complex phosphoric acid derivative.

Glycerin is also a product of certain kinds of fermentation, especially of the alcoholic fermentation of sugar; consequently it is a constituent of many wines and other fermented liquors. According to Louis Pasteur, about \( \frac{1}{8} \)th of the sugar transformed under ordinary conditions in the fermentation of grape juice and similar saccharine liquids into alcohol and other products becomes converted into glycerin. In certain natural fatty substances, e.g. palm oil, it exists in the free state, so that it can be separated by washing with boiling water, which dissolves the glycerin but not the fatty glycerides.

**Properties.**—Glycerin is a viscous, colourless liquid of sp. gr. 1.265 at 15° C, possessing a somewhat sweet taste; below 0° C, it solidifies to a white crystalline mass, which melts at 17° C. When heated alone it partially volatilizes, but the greater part decomposes; under a pressure of 12 mm. of mercury it boils at 170° C. In an atmosphere of steam it distills without decomposition under ordinary barometric pressure. It dissolves readily in water and alcohol, and is a constituent of many prepared substances, such as liquid ammonia, nitroglycerin, &c. The aqueous solution, being decomposed by air, is readily appreciable by the smell. It possesses considerable solvent powers, whence it is employed for numerous purposes in pharmacy and the arts. Its viscous character, and its non-liability to dry and harden by exposure to air, also fit it for various other uses, such as lubrication, &c., whilst its peculiar physical characters, enabling it to blend with either aqueous or oily matters under certain circumstances, render it a useful ingredient in a large number of products of varied kinds.

**Manufacture.**—The simplest modes of preparing pure glycerin are based on the saponification of fats, either by alkalis or by superheated steam, and on the circumstance that, although glycerin cannot be distilled by itself under the ordinary pressure without decomposition, it can be readily volatilized in a current of superheated steam. Commercial glycerin is mostly obtained from the "spent lyes" of the soap-maker. In the van Ryumbeke process the spent lyes are allowed to settle, and then treated with persulphate of iron, the heat decomposing the persulphate, and the products, but it is possibly a mixture of ferric and ferrous sulphates. Ferric hydrate, iron soap, and all insoluble impurities are precipitated. The liquid is filter-pressured, and any excess of iron in the filtrate is removed by a careful addition of caustic soda and then removed. The liquid is then evaporated under a vacuum of 27 to 28 in. of mercury, and, when of specific gravity 1.295 (corresponding to about 80% of glycerin), it is distilled under a vacuum of 28 to 29 in. In the Glax process the lye is treated with a little milk of lime, the liquid then neutralized with hydrochloric acid, and the liquid filtered. Evaporation and subsequent distillation under a high vacuum gives crude glycerin. The impure glycerin obtained as above is purified by redistillation in steam and evaporation in vacuum pans.

**Technical Uses.**—Besides its use as a starting-point in the production of glycerol (by distillation), glycerine is also largely employed for a number of purposes in the arts, its application thereto being due to its peculiar physical properties. Thus its fluidity enables it to freeze (when not absolutely anhydrous, which it practically never is when freshly exposed to the air) and its non-volatility at ordinary temperatures, combined with its power of always keeping fluid and not drying up and hardening, render it valuable as a lubricating liquid; as a lubricating ink, watches, &c., as a substitute for water in wet gas-meters, and as an ingredient in cataplasms, plasters, modelling clay, pastry colouring matters, dyeing materials, moist colours for artists, and numerous other analogous substances which require an impervious order under such soft condition. Glycerin acts as a preservative against decomposition, owing to its antiseptic qualities, which also led to its being employed to preserve the contents of various drug bottles. It is also employed, the hides being, moreover, kept soft and supple; to make solutions of gelatin, albumen, gum, paste, cements, &c., which will keep without decomposition; to preserve meat and other edibles; to embalm and give form to preserved organs, to prevent the skin from unchanging; and for many similar purposes. Its solvent power is also
GLYCOLS—GLYPTOTHÈK

utilized in the production of various colouring fluids, where the colouring matter would not dissolve in water alone; thus aniline violet, the tinctorial constituents of madder, and various allied colouring substances are obtained in the form of solutions which remain coloured even when diluted with water; the colouring matters being either retained in suspension or dissolved by the glycercin present in the diluted fluid. Glycerin is also employed in the manufacture of photography films, the forming liquids which remain coloured when diluted being improved by the substitution of glycercin, in part or entirely, for the sugar or honey usually added.

Glycerin as a medicinal use glycercin is an excellent solvent for such substances as iodine, alkalis, alkaloids, &c., and is therefore used for applying them to diseased surfaces, especially as it aids in their absorption. It does not evaporate or turn rancid, whilst its marked hygroscopic action causes the moistness and softness of any surface that it covers. Given by the mouth glycercin produces purging if large doses are administered, and has the same action if only a small quantity is given. For this purpose it is very largely used either as a suppository or in the fluid form (one or two drachms). The result is prompt, safe and pleasant. Glycerin is useless as a food and is not in any sense a substitute for cod-liver oil. Very large doses in animals cause lethargy, collapse and death.

GLYCOLS, in organic chemistry, the generic name given to the aliphatic dihydric alcohols. These compounds may be obtained by heating the alkylene iodides or bromides (e.g. ethylene dibromide) with silver acetate or with potassium acetate and alcohol, the esters so produced being then hydrolysed with caustic alkalis, thus:

$$\text{CH}_2\text{Br}_2+2\text{CH}_2\text{O}_2\cdot \text{Ag} \rightarrow \text{CH}_2(\text{O}-\text{CH}_2\text{OH})_2+2\text{K}+2\text{H}_2\text{O}$$

by the direct union of water with the alkylene oxides; by oxidation of the olefines with cold potassium permanganate solution (G. Wagner, *Ber.*, 1888, 21, p. 1231), or by the action of nitrous acid on the diamines.

Glycols may be classified as *primary*, containing two —CH₂OH groups; *secondary*, containing the grouping —CH(—CH₂—OH)₂—; and *tertiary*, with the grouping —CH(—CH₂—OH)—C—CH₃. The secondary glycols are prepared by the action of alcoholic potash on aldehydes, thus:

$$3\text{CH}_2\text{CH}_2\text{CO}_2\cdot \text{K}+\text{H}_2\text{O} \rightarrow 3\text{CH}_2\text{CH}_2\text{OH}+\text{CH}_3\text{CO}_2\cdot \text{K}$$

The tertiary glycols are known as *pinacones* and are formed on the reduction of ketones with sodium amalgam.

The glycols are somewhat thick liquids, of high boiling point, the pinacones only being crystalline solids; they are readily soluble in water and alcohol, but are insoluble in ether. By the action of dehydrating agents they are converted into glyceraldehydes or ketones. In their general behaviour towards oxidizing agents the primary glycols behave very similarly to the ordinary primary alcohols (q.v.), but the secondary and tertiary glycols break down, yielding compounds with a smaller carbon content.

Ethylene glycol, CH₂(—OH), was first prepared by A. Wurtz (from ethylene chloride); it has a slightly pungent etheraceous smell, and is highly poisonous; it is the silver acetate. It is a somewhat pleasant smelling liquid, boiling at 197° to 197.5° C., and having a specific gravity of 1.125 (°). On fusion with solid potash at 250° C it completely decomposes, giving potassium oxide and hydrogen.

Two propylene glycols, C₃H₈O₂, are known, viz. *α*-propylene glycol, CH₃CH(—OH)CH₂OH, a liquid boiling at 188° to 189°, and obtained by heating glycercin with sodium hydroxide and distilling the mixture; and *α*-triethylene glycol, CH₂(—OH)CH₂—CH₃, a liquid boiling at 214° C, and prepared by boiling triethylene bromide with potash solution (A. Zander, *Ann.*, 1882, 219, p. 178).

**GLYCICON** (from Glycon, a Greek lyric poet), a form of verse, best known in Catullus and Horace (usually in the catalectic variety—x—x—x—x—-), with three feet—a spondee and two dactyls; or four—three trochees and a dactyl, or a dactyl and three cherubs. Sir R. Jebb pointed out that the last form might be varied by placing the dactyl second or third, and according to its place this verse was called a First, Second or Third Glycicon.

**GLYPH** (from Gr. γλυφω, to carve), in architecture, a vertical channel in a frieze (see **TRIGLYPH**).

**GLYPHTON** (Greek for “fluted-tooth”), a name applied by Sir R. Owen to the typical representative of a group of gigantic, armadillo-like, South American, extinct Edentata, characterized by having the carapace composed of a solid piece (formed by the union of a multitude of bony dermal plates) without any movable rings. The facial portion of the skull is very short; a long process of the maxillary bone descends from the anterior part of the zygomatic arch; and the ascending ramus of the mandible is remarkably high. The teeth, 3 in the later species, are much alike, having two deep grooves or flutings on each side, so as to divide them into three distinct lobes (fig.). They are very tall and grew throughout life. The vertebral column is almost entirely widened into a set of tubercles but there is a complex joint at the base of the neck, to allow the head being retracted within the carapace. The limbs are very strong, and the feet short and broad, resembling externally those of an elephant or tortoise.

Glyptodonts constitute a family, the Glyptodonidae, whose position is next to the artiodactyls (Dasylopidae); the group being represented by a number of generic types. The Pleistocene forms, which remains occur only in the Sierra de los Buenos Aires pampas, are by far the largest. The skull and tail-sheath in some instances having a length of from 12 to 16 ft. In Glyptodon (with *Propalaeohippus*) the tail-sheath consists of a series of crown-like rings, gradually diminishing in diameter from the tip. Daediciuris, in which the tail-sheath is in the form of a club, has a solid club, is the largest member of the family; in *Pancichirus* and *Sclerocalyptus* (*Hoplophorus*) the tail-sheath consists of a series of smooth rings, and terminally of tube. In some specimens of these genera the horns, fixed at the base of the scutes, are expanded into a spongy, bony, club-like mass. The foramina, which are frequently partly closed, often show that the bones are hollow, and contain tubular passages of blood-vessels and nerves. The teeth are divided into two series, the upper figure showing the tooth of a Glyptodon; the lower cut in a tooth showing the tooth and upper surface of the teeth of a Glyptodon. Glyptodon excavatus, which is a species from Patagonia, has a long pointed beak, and a very large tail-sheath. The jaws are long, and the teeth sharp. The species was first described by A. Zander (1903-1904).

**GLYPTOTHÈK** (from Gr. γλυφω, carved, and θηκη, a place of storage), an architectural term, given to the gallery for the exhibition of sculpture, and first employed at Munich, where it was built to exhibit the sculptures from the temple of Aegina.
GMELIN, the name of several distinguished German scientists, of a Tübingen family. Johann Georg Gmelin (1747-1828), an apothecary in Tübingen, and an accomplished chemist for the times in which he lived, had three sons. The first, Johann Conrad (1702-1750), was an apothecary and surgeon in Tübingen. The second, Johann Georg (1709-1755), was appointed professor of chemistry and natural history in St Petersburg in 1731, and from 1733 to 1743 was engaged in travelling through Siberia. The fruits of his journey were Flora Sibirica (4 vols., 1749-1750) and Reisen durch Sibiren (4 vols., 1753). He ended his days as professor of medicine at Tübingen, a post to which he was appointed in 1749. The third son, Philipp Friedrich (1721-1784), was a most extraordinary professor of botany and chemistry. In the second generation Samuel Gottlieb (1743-1774), the son of Johann Conrad, was appointed professor of natural history at St Petersburg in 1766, and in the following year started on a journey through south Russia and the regions round the Caspian Sea. On his way back he was captured by Usmy Khan, of the Kaitak tribe, and died from the illness he suffered, on the 27th of July 1774. One of his nephews, Ferdinand Gottlob von Gmelin (1758-1838), became professor of chemistry and natural history at Tübingen in 1785, and another, Christian Gottlob (1792-1860), who in 1826 was one of the first to devise a process for the artificial manufacture of ultramarine, was professor of chemistry and pharmacy in the same university. In the youngest branch of the family, Philipp Friedrich had a son, Johann Friedrich (1748-1804), who was appointed professor of medicine in Tübingen in 1772, and in 1775 accepted the chair of medicine and chemistry at Göttingen. In 1788 he published the 13th edition of Linnaeus' Systema Naturae with many additions and alterations. His son Leopold (1788-1825), was the best-known member of the family. He studied medicine and chemistry at Göttingen, Tübingen and Vienna, and in 1813 began to lecture on chemistry at Heidelberg, where in 1814 he was appointed extraordinary, and in 1817 ordinary, professor of chemistry and medicine. He was the discoverer of potassium ferricyanide (1822), and wrote the Handbuch der Chemie (1st ed. 1817-1819, 4th ed. 1843-1855), an important work in its day, which was translated into English for the Cavendish Society by H. Watts (1815-1884) in 1848-1859. He resigned his chair in 1854, and died on the 13th of April in the following year at Heidelberg.

GMUND, a town of Germany, in the kingdom of Württemberg, in a charming and fruitful valley on the Rems, here spanned by a beautiful bridge, 31 m. E.N.E. of Stuttgart on the railway to Nördlingen. Pop. (1905) 18,609. It is surrounded by old walls, flanked with towers, and has a considerable number of ancient buildings, among which are the fine church of the Holy Cross; St John's church, which dates from the time of the Hohenstaufen; and, situated on a height near the town, partly hewn out of the rock, the pilgrimage church of the Saviour. Among the modern buildings are the gymnasia, the drawing and trade schools, the Roman Catholic seminary, the town hall and the industrial art museum. Clocks and watches are manufactured here and also other articles of silver, while the town has a considerable trade in corn, hops and fruit. The scenery in the neighbourhood is very beautiful, near the town being the district called Little Switzerland.

Gmund was surrounded by walls in the beginning of the 12th century by Duke Frederick of Schwabia. It received town rights from Frederick Barbarossa, and after the extinction of the Hohenstaufen became a free imperial town. It retained its independence till 1803, when it came into the possession of Württemberg. Gmund is the birth-place of the painter Hans Baldung (1475-1545) and of the architect Heinrich Atler or Parler (c. 1350). In the middle ages the population was about 10,000. See Kaiser, Gmund und seine Umgebung (1888).

GMUNDEN, a town and summer resort of Austria, in Upper Austria, 40 m. S.S.W. of Linz by rail. Pop. (1900) 7126. It is situated at the efflux of the Traun river from the lake of the same name and is surrounded by high mountains, as the Traunstein (5446 ft.), the Erlakogel (5250 ft.), the Wilde Kogel (6860 ft.) and the Höllin Gebirge. It is much frequented as a health and summer resort, and has a variety of lake, brine, vegetable and pine-cone baths, a hydrophatic establishment, inhalation chambers, whey cure, &c. There are a great number of excursions and points of interest round Gmunden, specially worth mentioning is the Traun Falls, 10 m. N. of Gmunden. It is an important centre of the salt industry in Salzkammergut. In antiquity it was a town of great importance already in 1826. On the 14th of November 1626, Pappenheim completely defeated here the army of the rebellious peasants.

See F. Krackowizer, Geschichte der Stadt Gmunden in Oberösterreich (Gmunden, 1898-1901, 3 vols.)

GNAT (O. Eng. gnat), the common English name for the smaller dipterous flies (see Diptera) of the family Culicidae, which are now included among "mosquitoes" (see Mosquito). The distinctive term has no zoological significance, but in England the "mosquito" has commonly been distinguished from the "gnat" as a variety of larger size and more poisonous bite.

GNAITHPODA, a term in zoological classification, suggested as an alternative name for the group Arthropoda (q.v.). The word, which means "jaw-footed," refers to the fact that in the members of the group, some of the lateral appendages or "feet" in the region of the mouth act as jaws.

GNATIA (also Egnatia or Ignatia, mod. Anazoo, near Pasano), an ancient city of the Peucetti, and their frontier town towards the Salentini (i.e. of Apulia towards Calabria), in Roman times of importance for its trade, lying as it did on the sea, at the point where the Via Traiana joined the coast road, 38 m. S.E. of Bari. The ancient city walls have been almost entirely destroyed in recent times to provide building material, and the place is famous for the discoveries made in its tombs. A considerable collection of antiquities from Gnatia is preserved at Pasano, though the best are in the museum at Bari. Gnatia was the scene of the prodigy at which Horace mocks (Sat. I. 5. 97). Near Pasano are two small subterranean chapels with paintings of the 11th century a.d. (E. Bertaux, L’Art dans l’Italie méridionale au xii. s., 1904, 135.)

GNEISENAU, AUGUST WILHELM ANTON, COUNT NEIDHARD von (1760-1831), Prussian field marshal, was the son of a Saxon officer named Neithardt. Born in 1760 at Schildau, near Torgau, he was brought up in great poverty there, and subsequently at Würzburg and Erfurt. In 1777 he entered Erfurt university; but two years later joined an Austrian regiment there quartered. In 1782 taking the additional name of Gneisenau from some lost estates of his family in Austria, he entered as an officer the service of the margrave of Bayreuth-Anspach. With one of that prince’s mercenary regiments in English pay he saw active service and gained valuable experience in the War of American Independence, and returning in 1786, applied for Prussian service. Frederick the Great gave him a commission as first lieutenant in the infantry. Made Staatskapitän in 1790, Gneisenau served in Poland, 1793-1794, and, subsequently to this, ten years of quiet garrison life in Jauer enabled him to undertake a wide range of military studies. In 1796 he married Caroline von Kottwitz. In 1800 he was one of Hohenlohe’s staff-officers, fought at Lüga, and a little later commanded a provisional infantry brigade which fought under Lestocq in the Lithuanian campaign. Early in 1807 Major von Gneisenau was sent as commandant to Colberg, which, small and ill-protected as it was, succeeded in holding out until the peace of Tilsit. The commandant received the much-prized order “pour le mérite,” and was promoted lieutenant-colonel. A wider sphere of work was now opened to him. As chief of...
engineers, and a member of the reorganizing committee, he played a great part, along with Scharnhorst, in the work of reconstructing the Prussian army. A colonel in 1809, he soon drew upon himself, by his energy, the suspicion of the dominant French, and Stein's fall was soon followed by Gneisenau's retirement. But, after visiting Russia, Sweden and England, he returned to Berlin and resumed his place as a leader of the patriotic party. In open military work and secret machinations his energy and patriotism were equally tested, and with the outbreak of War of Liberation, Major-General Gneisenau became Blücher's quartermaster-general. Thus began the connexion between these two soldiers which has furnished military history with its best example of the harmonious cooperation between the general and his chief-of-staff. With Blücher, Gneisenau served to the capture of Paris; his military character was the exact complement of Blücher's, and under this happy guidance the young troops of Prussia, often defeated but never discouraged, fought their way into the heart of France. The plan of the march on Paris, which led directly to the fall of Napoleon, was specifically the work of the chief-of-staff. In reward for his distinguished service he was in 1814, along with York, Kleist and Bühlow, made count at the same time as Blücher became prince of Wahlstatt; an annuity was also assigned to him.

In 1815, once more chief of Blücher's staff, Gneisenau played a very conspicuous part in the Waterloo campaign. Senior generals, such as York and Kleist, had been set aside in order that the chief-of-staff should have the command in case of need, and he was on the field of Ligny the old field marshal was disabled, Gneisenau at once assumed the control of the Prussian army. Even in the light of the evidence that many years' research has collected, the precise part taken by Gneisenau in the events which followed is much debated. It is known that Gneisenau had the deepest distrust of the British commander, who, he considered, had left the Prussians in the lurch at Ligny, and that to the hour of victory he had grave doubts as to whether he ought not to fall back on the Rhine. Blücher, however, soon recovered from his injuries, and, with Grolmann, the quartermaster-general, he managed to convince Gneisenau. The relations of the two may be illustrated by Brigadier-General Hardinge's report. Blücher burst into Hardinge's room at Wavre, saying "Gneisenau has given way, and we are to march at once to your chief."

On the field of Waterloo, however, Gneisenau was quick to realize the magnitude of the victory, and he carried out the pursuit with a relentless vigour which has few parallels in history. His reward was further promotion and the insignia of the "Black Eagle" which had been taken in Napoleon's camp with the sword of von Blücher. He was appointed commander of the VIIIth Prussian Corps, but soon retired from the service, both because of ill-health and for political reasons. For two years he lived in retirement on his estate, Erdmannsdorf in Silesia, but in 1818 he was made governor of Berlin in succession to Kalkreuth, and member of the Staatsrat. In 1825 he became general field marshal. In 1831 he was appointed to the command of the Army of Observation on the Polish frontier, with Clausewitz as his chief-of-staff. At Pozen he was struck down by cholera and died on the 24th of August 1831, soon followed by his chief-of-staff, who fell a victim to the same disease in November.

As a soldier, Gneisenau was the greatest Prussian general since Frederick; as a man, his noble character and virtuous life secured him the affection and reverence, not only of his superiors and subordinates in the service, but of the whole Prussian nation. A statue by Rauch was erected in Berlin in 1855, and in memory of the siege of 1809 the Collberg grenadiers received his name in 1889. One of his sons led a brigade of the VIIIth Army Corps in the war of 1870. See H. Pertz, Das Leben des Feldmarschalls Grafen Neidhardt von Gneisenau, vols. 1-3 (Berlin, 1864-1866); vols. 4 and 5. G. Deibler (ib. 1879, 1880), with numerous documents and letters; H. Bisbeck, Das Leben des G. F. Grafen von Gneisenau (2 vols., 2nd ed., Berlin, 1894) based on Pertz's work, but containing much new material; Frau von Biegulin, Denkwürdigkeiten (Berlin, 1892); Horsmayr, Lebensbilder aus den Befreiungskriegen (Jena, 1841); Pick, Aus dem brieflichen Nachlass Gneisenaus; also the histories of the campaigns of 1807 and 1813-15.

**GNEISS**

A term long used by the miners of the Harz Mountains to designate the country rock in which the mineral veins occur; it is believed to be a word of Slavonic origin meaning "rotted" or "decomposed." It has gradually passed into acceptance as a generic term signifying a large and varied series of metamorphic rocks, which mostly consist of quartz and felspar (orthoclase and plagioclase) with muscovite and biotite, hornblende or augite, iron oxides, zircon and apatite. There is also a long list of accessory minerals which are present in gneisses with more or less frequency, but not invariably, as garnet, sillimanite, cordierite, graphite and graphiteid, epidote, calcite, orthite, tourmaline and andalusite. The gneisses all possess a more or less marked parallel structure or foliation, which is the main feature by which many of them are separated from the granites, a group of rocks having nearly the same mineralogical composition and closely allied to many gneisses.

The felspars of the gneisses are predominantly orthoclase (often perthitic), but microcline is common in the more acid types and oligoclase occurs also very frequently, especially in certain sedimentary gneisses, while more basic varieties of plagioclase are rare. Quartz is very seldom absent and may be blue or milky and opalescent. Muscovite and biotite may both occur in the same rock; in other cases only one of them is present. The commonest and most important types of gneiss are the mica-gneisses, with muscovite or biotite and other minerals. Such gneisses are often referred to as "hornblende-biotite-mica-gneisses." In some people's eyes they are not very beautiful rocks, but they are very useful. They are often used for building materials, and they are also very useful for making tools, and for many other purposes.

Muscovite-gneiss, biotite-gneiss and muscovite-biotite-gneiss, more common perhaps than all the others taken together, are grey or pinkish rocks according to the colour of their prevalent felspar, not unlike granites, but on the whole more often fine-grained (though coarse-grained types occur) and possessing a gneissose or foliated structure. The latter consists in the arrangement of the flakes of mica in such a way that their faces are parallel, and hence the rock has the property of splitting more easily in the direction in which the mica plates are elongated. This property, though usually marked, is not so great as in the schists or slates, and the split faces are not so smooth as in these latter rocks. The films of mica may be continuous and are usually not flat, but irregularly curved. In some gneisses the parallel flakes of mica are scattered through the quartz and felspar; in others these minerals form discrete bands, the quartz and felspar being grouped into lenticles separated by thin films of mica. When large felspars, of rounded or elliptical form, are visible in the gneiss, it is said to have augen structure (Ger. Augen = eyes). It should also be remarked that the essential component minerals of the rocks of this family are practically always determinable by naked eye inspection or with the aid of a simple lens. If the rock is too fine grained for this it is generally relegated to the schists. When the bands of folia are very fine and tortuous the structure is called hélitique.

In mica-gneisses sillimanite, kyanite, andalusite and garnet may occur. The significance of these minerals is variously interpreted; they may indicate that the gneiss consists wholly or in part of sedimentary material which has been contact-altered, but they have also been regarded as having been developed by metamorphic action out of biotite or other primary ingredients of the rock.
Hornblende-gneisses are usually darker in colour and less fissile than mica-gneisses; they contain more plagioclase, less orthoclase and microcline, and more biotite and epidote. Many of the porphyroblasts in hornblende and thus form transitions to amphibolites. Pyroxene-gneisses are less frequent but occur in many parts of both hemispheres. The "charnockite" series are very closely allied to the pyroxene-gneisses. Hypersthene and scapolite both may occur in these rocks and they are sometimes garnetiferous.

In every country where the lowest and oldest rocks have come to the surface and been exposed by the long continued action of denuda
tion, there have been formed gneisses of great abundance and of many different kinds. They are in fact the typical rocks of the Archean (Lewisian, Laurentian, &c.) series. In the Alps, Harz, Scotland, Norway and Sweden, Canada, South America (the so-called "metamorphosed" localities) they occupy wide areas and exhibit a rich diversity of types. From this it has been inferred that they are of great geological age, and in fact this can be definitely proved in many cases, for the oldest known fossiliferous formations may be seen to rest unconformably on these gneisses and are made up of their débris. It was for a long time believed that they represented the primitive crust of the earth, and while this is no longer generally taught there are still geologists who hold that these gneisses are necessarily of pre
cambrian age. Others, while admitting the general truth of this hypothesis, have distinguished three major types of gneiss. They have clearly shown that an injection of igneous rock can be seen to penetrate into rocks which may be as recent as the Tertiary period, or to pass into these rocks so gradually and in such a way as to make it certain that the gneisses are merely altered states of the original sedimentary or igneous rocks. The controversy has arisen on these points; but this is certain, that gneisses are far the most common among Archean rocks, and where their age is not known the presumption is strong that they are at least pre-cambrian.

Many gneisses are undoubtedly sedimentary rocks that have been brought to their present state by such agents of metamorphism as heat, movement, crushing and recrystallization. This may be demonstrated partly by their mode of occurrence: they accompany limestones, graphic schists, quartzites and other rocks of sedimentary type; some of them where least altered may even remain resem
ding beds of sedimentary strata. But only a limited number of gneisses can be shown to penetrate into rocks which may be as recent as the Tertiary period, or to pass into these rocks so gradually and in such a way as to make it certain that the gneisses are merely altered states of the original sedimentary or igneous rocks. The controversy has arisen on these points; but this is certain, that gneisses are far the most common among Archean rocks, and where their age is not known the presumption is strong that they are at least pre-cambrian.

Joining the Left, he at once became one of its leading spokesmen. His chief oratorical triumphs are associated with the early period of his membership of the House of Commons. Among the noteworthy occasions being his violent attack (September 1862) upon the government budget in connexion with the reorganization of the Prussian army, and his defence (1864) of the Polish chiefs of the (then) grand-duchy of Posen, who were accused of high treason. In 1827–1863 was published Das heutige englische Verfassungs- und Verwaltungsrecht, a work which, contrasting English and German constitutional law and administration, aimed at exercising political pressure upon the government of the day. In 1868 Gneist became a member of the North German Parliament and was a member of the commission for organizing the federal army, and also of that for the settlement of ecclesiastical controversial questions. On the establishment of German unity his mandate was renewed for the Reichstag, and in this he sat, an active and prominent member of the National Liberal party, until 1884. In the Kulturkampf he sided with the government against the attacks of the Clericals, whom he bitterly denounced, and whose implacable enemy he ever showed himself. In 1879, together with his colleague, von Hadeln, he violently attacked the motion for the prosecution of certain Socialists members, which as a result of the vigour of his opposition was almost unanimously rejected. He was parliamentary reporter for the committees on all great financial and administrative questions, and his profound acquaintance with constitutional law caused his advice to be frequently sought, not only in his own but also in other countries. In Prussia he largely influenced legislation, the reform of the judicial and penal systems and the new constitution of the Evangelical Church being largely his work. He was also consulted by the Japanese government when a constitution was being introduced into that country. In 1875 he was appointed a member of the supreme administrative court (Oberverwaltungsgericht) of Prussia, but only held office for two years. In 1882 was published his Englische Verfassungs- geschichte (trans. History of the English Constitution, London, 1886), which may perhaps be described as his magnum opus. It placed the author at once on the level of such writers on English constitutional history as Hallam and Stubbs, and supplied English literature with a text-book almost unrivalled in point of historical research. In 1888 one of the first acts of the ill-fated emperor Frederick III., who had always, as crown prince, shown great admiration for him, was to ennable Gneist, and attach him as instructor in constitutional law to his son, the emperor William II., a charge of which he worthily acquitted himself. The last years of his life were full of energy, and, in the possession of all his faculties, he continued his wonted academic labours until a short time before his death, which occurred at Berlin on the 22nd of July 1895.

As a politician, Gneist's career cannot perhaps be said to have been entirely successful. In a country where parliamentary institutions are the living exponents of the popular will he might have risen to a foremost position in the state; as it was, the party to which he allied himself could never hope to become more than what it remained, a parliamentary faction, and the influence it for a time wielded in the counsels of the state waned as soon as the Social-Democratic party grew to a force to be reckoned with. It is as a writer and a teacher that Gneist is best known to fame. He was a jurist of a special type. To him law was not mere theory, but living force; and this conception of its power animates all his schemes of practical reform. As a teacher he exercised a magnetic influence, not only by reason of the clearness and cogency of his exposition, but also because of the success with which he developed the talents and guided the aspirations of his pupils. He was a man of noble bearing, religious, and imbued with a stern sense of duty. He was proud of being a "Preussischer Junker" (a member of the Prussian squarcry), and throughout his writings, despite their liberal tendencies, may be perceived the loyalty and affection with which he clung to monarchical institutions. A great admirer and a true friend of England, to which country he was attached by many personal ties, he surpassed all other Germans in his efforts to make her free institutions, in which he found his ideal, the common heritage of the two great nations of the Teutonic race.

Gneist was a prolific writer, especially on the subject he had made peculiarly his own, that of constitutional law and history, and among his works, other than those above named, may be mentioned the following: Biographie und Gesetz nach dem constitutionellen Staatsrecht (Berlin, 1872, and 2nd edition 1879) ; Zur Verwaltungsreform in Preussen (Leipzig, 1880) ; Das englische Parlament (Berlin, 1886) ; in English translation The English Parliament (London, 1887, 2nd edition, 1889); Die Militär-Vorlage von 1862 und der preussische Verfassungs- konflikt von 1862 bis 1866 (Berlin, 1893); Die nationale Rechtsidee von den Ständen und das preussische Dreiklassenwahl- system (Berlin, 1895); Das Verfassungsverhältniss des Gesamtministereums (ib., 1895). See O. Gierke, Rudolph von Gneist, Gedächtnisrede (Berlin, 1895), an In Memoriam address delivered in Berlin.

GNESEN (Polish, Gniezno), a town of Germany, in the Prussian province of Posen, in an undulating and fertile country, on the Wreszna, 30 m. E.N.E. of Posen by the railway to Thorn. Pop. (1895) 23,727. Besides the cathedral, a handsome Gothic edifice, whose towers, the remains of St Adalbert, there are eight Roman Catholic churches, a Protestant church, a synagoge, a clerical seminary and a convent of the Franciscan nuns. Among the industries are cloth and linen weaving, brewing and distilling. A great horse and cattle market is held here annually. Gnesen is one of the oldest towns in the former kingdom of Poland. Its name, Gniezno, signifies "nest," and points to early Polish traditions. The cathedral is believed to have been founded towards the close of the 9th century, and, having been the bones of St Adalbert, it was visited in the 13th by the emperor Otto III., who made it the seat of an archbishop. Here, until 1520, the kings of Poland were crowned; and the archbishop, since 1416 primate of Poland, acted as protector pending the appointment of a new king. In 1821 the see of Posen was founded and the archbishop removed his residence thither, though its cathedral chapter still remains at Gnesen. After a long period of decay the town revived after 1815, when it came under the rule of Prussia.

See S. Karowski, Gniezno (Posen, 1892).

Gnome, and Gnomic Poetry. Sententious maxims, put into verse for the better aid of the memory, were known by the Greeks as gnomoi, γνωμοι, from γνωμή, or opinion. A gnome is defined by the Elizabethan critic Henry Peacham (1576–1643) as "a saying pertaining to the manners and common practices of men, which declareth, with an apt brevity, what in this our life ought to be done, or not done." The Gnomic Poets of Greece, who flourished in the 6th century B.C., were those who arranged series of sententious maxims in verse. These were collected in the 4th century, by Lobon of Argos, an orator, but his collection has disappeared. The chief gnomic poets were Theognis, Solon, Phocyllides, Simonides of Amorgos, Demodocus, Xenophanes and Euenus. With the exception of Theognis, whose gnomes were fortunately preserved by some schoolmaster about 300 B.C., only fragments of the Gnomic Poets have come down to us. The moral poem attributed to Phocyllides, long supposed to be a masterpiece of the school, is now known to have been written by a Jew in Alexandria. Of the gnomic movement typified by the moral works of the poets named above, Prof. Gilbert Murray has remarked that it receives its special expression in the conception of the Seven Wise Men, to whom such proverbs as "Know thyself" and "Nothing too much" were popularly attributed, and whose names differed in different lists. These gnomes or maxims were extended and put into literary shape by the poets. Fragments of Solon, Euenus and Minnemnus have been preserved, in a very confused state, from having been written, for purposes of comparison, on the margins of the MSS. of Theognis, whence they have often slipped into the text of that poet. Theognis enshrines his moral precepts in his elegies, and this was probably the custom of the rest; it is improbable that there ever existed a species of poetry made up entirely of successive gnomes. But the title "gnomic" came to be given to all poetry which dealt in a sententious way with questions
of ethics. It was, unquestionably, the source from which moral philosophy was directly developed, and theorists upon life and infinity, such as Pythagoras and Xenophanes, seem to have begun their career as gnomic poets. By the very nature of things, gnomes, in their literary sense, belong exclusively to the dawn of literature; their naive and their simplicity in moralizing betray it. But it has been observed that many of the ethical reflections of the great dramatists, and in particular of Sophocles and Euripides, are gnomic distichs expanded. It would be an easy task to supply that the ancient Greek gnomes are all of a solemn character; some are voluptuous and some chivalrous; those of Democritus of Leros had the reputation of being droll. In modern times, the gnostic spirit has occasionally been played by displays of a homely philosophy, such as Francis Quarles (1592–1644) in England and Gui de Pibrac (1529–1584) in France. The once-celebrated Quatrains of the latter, published in 1574, enjoyed an immense success throughout Europe; they were composed in deliberate imitation of the Greek gnomic writers of the 6th century B.C. These modern effusions are rarely literary and perhaps more poetical than philosophical. The writings of Pibrac it was long customary to hold up those of Antoine Favre (or Faber) (1557–1624) and of Pierre Mathieu (1563–1621). Gnomes are frequently to be found in the ancient literatures of Arabia, Persia, and India, and in the Icelandic staves. The priamel, a brief, sententious kind of poem, which was in favour in Germany from the 12th to the 16th century, belonged to the true gnomic class, and was cultivated with particular success by Hans Rosenblut, the legendary goldsmith of Nuremberg, in the 15th century. Gnomes (Fr. gnomes, Ger. Gnomen), in folk-lore, the same name now applied to the earth and mountain spirits who are supposed to watch over veins of precious metals and other hidden treasures. They are usually pictured as bearded dwarfs clad in brown close-fitting garments with hoods. The word "gnome" as applied to these is of comparatively modern and somewhat uncertain origin. By some it is said to have been coined by Paracelsus (so Hatzfeld and Darmesteter, Dictionnaire), who uses Gnomi as a synonym of Pygmaei, from the Greek ψυγμαί, intelligence. The New English Dictionary, however, suggests a derivation from gnomos, i.e. a Greek type γνῶμη, "earth-dweller," on the analogy of θαλασσογνωμη, "dwelling in the sea," adding, however, that though there is no evidence that the term was not used before Paracelsus, it is possibly "a mere arbitrary invention, like so many others found in Paracelsus" (N.E.D. s.v.).

Gnomon, the Greek word for the style of a sundial, or any object, commonly a vertical column, the shadow of which was observed in former times in order to learn the altitude of the sun, especially when on the meridian. The art of constructing a sundial is sometimes termed gnomastics. In geometry, a gnomon is a plane figure formed by removing a parallelogram from a corner of a larger parallelogram; in the figure ABCDEFA is a gnomon. Gnomonic projection is a projection of a sphere in which the centre of sight is the centre of the sphere.

Gnosticism (Gr. γνώσις, knowledge), the name generally applied to that spiritual movement existing side by side with genuine Christianity, as it gradually crystallized into the old Catholic Church, which may roughly be defined as a distinct religious and moral system bearing the strong impress of Christian influences.

I. The term "Gnosis" first appears in a technical sense in 1 Tim. vi. 20 (γνωσίας ὡς γνῶμα). It seems to have at first been applied exclusively, or at any rate principally, to a particular tendency within the movement as a whole, i.e. to those sections of (the Syrian) Gnostics otherwise generally known as Ophites or Naaseni (see Hippolytus, Philosophumena, v. 21: Naassenoi...οἱ ἐναυτοῖς οὐρανικοὶ ἀποκλειόμενοι; Irenaeus 1. 11, 1; Epiphanius, Haer. xxi. 24, ed. Caes.): the self-assumed name of the Carpocratians, Iren. i. 25, 6). But in Irenaeus the term has already come to designate the whole movement. This first came

into prominence in the opening decades of the 2nd century A.D., but is certainly older; it reached its height in the second third of the same century, and began to wane about the 3rd century, and from the second half of the 3rd century onwards was replaced by the closely-related and more powerful Manichaean movement. Offshoots of it, however, continued on into the 4th and 5th centuries. Epiphanius still had the opportunity of making personal acquaintance with Gnostic sects.

II. Of the actual writings of the Gnostics, which were extraordinarily numerous,1 very little has survived; they were sacrificed to the destructive zeal of their ecclesiastical opponents. Numerous fragments and extracts from Gnostic writings are to be found in the works of the Fathers who attacked Gnosticism. Most valuable of all are the long extracts in the 5th and 6th books of the Philosophumena of Hippolytus. The most accessible and best critical edition of the fragments which have been preserved word for word is to be found in Hilgenfeld's Ketzergeschichte des Urchristentums. One of the most important of these fragments is the letter of Polteraus to Flora, preserved in Epiphanius, Haeres. 43, which has come down to us on the MS. Harnack in the Sitzungsbücher der Berliner Akademie, 1902, pp. 507–545. Gnostic fragments are certainly also preserved for us in the Acts of Thomas. Here we should especially mention the beautiful and much-discussed Song of the Pearl, or Song of the Soul, which is generally, though without absolute clear proof, attributed to the Gnostic Bardesanes (till lately it was known only in the Syrian text; edited and translated by Bevan, Texts and Studies, 2, 1890; Hofmann, Zeitschrift für neutestamentliche Wissenschaft, iv.; for the newly-found Greek text see Acta apostolorum, ed. Bonnet, ii. 3, which is generally accepted as the original). The most accessible and best critical edition of it is to be found in the apocryphal histories of the Apostles. To the school of Bardesanes belongs the "Book of the Laws of the Lands,"2 which does not, however, contribute much to our knowledge of Gnosticism. Finally, we should mention in this connexion the text on which are based the pseudo-Clementine Homilies and Recognitions (beginning of the 3rd century). It is, of course, already permeated with the Catholic spirit, but has drawn so largely upon sources of a Judaic-Christian Gnostic character that it comes to a great extent within the category of sources for Gnosticism.

Complete original Gnostic works have unfortunately survived to us only from the period of the decadence of Gnosticism. Of these we should mention the comprehensive work called the Pistis-Sophia, probably belonging to the second half of the 3rd century.3 Further, the Coptic-Gnostic texts of the Codex Bruciatus; both the books of Ieu, and an anonymous third work (edited and translated by C. Schmidt, Texte und Untersuchungen, vol. viii., 1892; and a new translation by the same in Koptische-gnostische Schriften, 1) which, contrary to the opinion of their editor and translator, the present writer believes to represent, in their existing form, a still later period and a still more advanced stage in the decadence of Gnosticism.

For other and older Coptic-Gnostic texts, in one of which is contained the source of Irenaeus's treatise on the Barbelognostics, but which have unfortunately not yet been made completely accessible, see C. Schmidt in Sitzungsberichte der Berl. Akad. (1866), p. 839 seq., and "Philostasia," dedicated to Paul Kleinert (1907), p. 315 seq.

On the whole, then, for an exposition of Gnosticism we are thrown back upon the polemical writings of the Fathers in their controversy with heretics. The most ancient of these is Justin, who according to his Apol. i. 36 wrote a Syntagma against all heresies (c. A.D. 150), and also, probably, a special polemic against

1 See the list of their titles in A. Harnack, Geschichte der altchristlichen Literatur, Teil i. v. 171; ib. Teil ii. Chronologie der altchristl. Texte und Untersuchungen, ii. 753, 754; übri Lichtenthal, Die Offenbarung in Gnosticismus (1901).

2 For the text see A. Merx, Bardesanes von Edessa (1863), and A. Hilgenfeld, Bardesanes der lateinische Gnostiker (1866).

3 Cf. the German-Swiss edition of the text and Schinz's translation by C. Schmidt, Koptisch-gnostische Schriften, i. (1905), in the series Die griechischen christlichen Schriftsteller der ersten drei Jahrhunderte; see also A. Harnack, Texte und Untersuchungen, ii. 7, Heft 2 (1891), and Chronologie der altchristlichen Literatur, ii. 193–195.
Marcion (fragment in Irenaeus iv. 6. 2). Both these writings are lost. He was followed by Irenaeus, who, especially in the first book of his treatise Adversus haereses (Octogyn και άπαντως της έποδενης γνώσεως βιβλία πέντε, c. x.d. 180), gives a detailed account of the Gnostic heresies. He founds his work upon that of his master Justin, but adds from his own knowledge among many other things, notably the detailed account of Valentinianism at the beginning of the book. On Irenaeus, and probably also on Justin, Hippolytus drew for his Syntagma (beginning of the 3rd century), a work which is also lost, but can, with great certainty, be reconstructed from three recensions of it: in the Panarion of Epiphanius (after 374), in Philaster of Brescia, Adversus haereses, and the Pseudo-Tertullian, Liber adversus omnes haereses. A second work of Hippolytus (Κατά πασών αφιέρων άνεξα) is preserved in the so-called Philosophumenon which survives under the name of Origen. Here Hippolytus gave a second exposition supplemented by fresh Gnostic original sources with which he had become acquainted in the meanwhile. These sources quoted in Hippolytus have lately met with very unfavourable criticisms. The opinion has been advanced that Hippolytus has here fallen a victim to the mystification of a forger. The truth of the matter must be that Hippolytus probably made use of a collection of Gnostic texts, put together by a Gnostic, in which were already represented various secondary developments of the genuine Gnostic schools. It is also possible that the compiler has himself attempted here and there to harmonize to a certain extent the various Gnostic doctrines, yet in no case is this collection of sources given by Hippolytus to be passed over; it should rather be considered as important evidence for the beginnings of the decay of Gnosticism. Very noteworthy references to Gnosticism are also to be found scattered up and down the Stromates of Clement of Alexandria. Especially important are the Excerpta ex Theodoto, the author of which is certainly Clement, which are verbally extracted from Gnostic writings, and have almost the value of original sources. The writings of Origen also contain a wealth of material. In the first place should be mentioned the treatise Contra Celsum, in which the expositions of Gnosticism by both Origen and Celsum are of interest (see especially v. 61 seq. and vi. 25 seq.). Of Tertullian's works should be mentioned: De praescriptione haereticorum, especially Adversus Marcionem, Adversus Hermogenem, and finally Adversus Valentinianos (entirely founded on Irenaeus). Here must also be mentioned the dialogue of Adamantius with the Gnostics, De recta in deum fide (beginning of 4th century.). Among the followers of Hippolytus, Epiphanius in his Panarion gives much independent and valuable information from his own knowledge of contemporary Gnosticism. But Theodoret of Cyrus (d. 455) is already entirely dependent on previous works and has nothing new to add. With the 4th century both Gnosticism and the polemical literature directed against it die out.¹

III. If we wish to grasp the peculiar character of the great Gnostic movement, we must take care not to be led astray by the catchword "Gnosis." It is a mistake to regard the Gnostics as pre-eminent ly the representatives of intellect among Christians, and Gnosticism as an intellectual tendency chiefly concerned with philosophical speculation, the reconciliation of religion with philosophy and theology. It is true that when Gnosticism was at its height it numbered amongst its followers both theologians and men of science, but that is not its main characteristic. Among the majority of the followers of the movement "Gnosticism" was understood not as meaning "knowledge" or "understanding," in our sense of the word, but "revelation." These little Gnostic sects and groups all lived in the conviction that they possessed a secret and mysterious knowledge, in no way accessible to those outside, which was not to be proved or propagated, but believed in by the initiated, and anxiously guarded as a secret. This knowledge of theirs was not based on reflection, on scientific inquiry and proof, but on revelation. It was derived directly from the times of primitive Christianity; from the Saviour himself and his disciples and friends, with whom they claimed to be connected by a secret tradition, or else from later prophecies of which they were the bearers. It was laid down in wonderful mystic writings, which were in the possession of the various circles (Liechtenhahn, Die Offenbarung im Gnosticismus, 1901).

In short, Gnosticism, in all its various sections, its form and its character, falls under the great category of mystic religions, which were so characteristic of the religious life of decadent antiquity. In Gnosticism as in the other mystic religions we find the same contrast of the initiated and the unintiated, the same loose organization, the same kind of petty sectarianism and mystery-mongering. All alike boast a mystic revelation and a deeply-veiled wisdom. As in many mystical religions, so in Gnosticism, the ultimate object is individual salvation, the assurance of a fortunate destiny for the soul after death. As in the others, so in this the central object of worship is a redeemer-deity who has already trodden the difficult way which the faithful have to follow. And finally, as in all mystical religions, so here too, holy rites and formulas, acts of initiation and consecration, all those things which we call sacraments, play a very prominent part. The Gnostic religion is full of such sacraments. In the accounts of the Fathers we find less about them; yet here Irenaeus' account of the Marcionites is of the highest significance (i. 21 seq.). Much more material is to be found in the original Gnostic writings, especially in the Pistis-Sophia and the two books of Ieu, and again in the Excerpta ex Theodoto, the Acts of Thomas, and here and there in the pseudo-Clementine writings. Above all we can see from the original sources of the Mandaean religion, which also represents a branch of Gnosticism, how great a part the sacraments played in the Gnostic sects (Brandt, Mandische Religion, p. 96 seq.). Everywhere we are met with the most varied forms of holy rites —the various baptisms, by water, by fire, by the spirit, the baptism for protection against demons, anointing with oil, sealing and stigmatizing, piercing the ears, leading into the bridal chamber, partaking of holy food and drink. Finally, sacred formulas, names and symbols are of the highest importance among the Gnostic sects. We constantly meet with the idea that the soul, on leaving the body, finds its path to the highest heaven opposed by the deities and demons of the lower realms of heaven, and only when it is in possession of the names of these demons, and can repeat the proper holy formula, or is supported in its way with the right passwords, can it escape from the holy oil, finds its way unhindered to the heavenly home. Hence the Gnostic must above all things learn the names of the demons, and equip himself with the sacred formulas and symbols, in order to be certain of a good destiny after death. The exposition of the system of the Ophites given by Celsius (in Origen vi. 25 seq.), and, in connexion with Celsius, by Origen, is particularly instructive on this point. The two "Coptic Ieu" books unfold an immense system of names and symbols. This system again was simplified, and as the supreme secret was taught in a single name or a single formula, by means of which the happy possessor was able to penetrate through all the lower heavens (cf. the name "Caulacau" among the Basiladians; Irenaeus, Adv. haer. i. 24. 5, and among other sects). It was taught that even the redeemer-god, when he once descended on to this earth, to rise from it again, availed himself of these names and formulas on his descent and ascent through the world of demons. Traces of ideas of this kind are to be met with almost everywhere. They have been most carefully collected by Anz (Ursprung des Gnosticismus, Texte und Untersuchungen xxv. 4 passim) who would see in them the central doctrine of Gnosticism.

IV. All these investigations point clearly to the fact that Gnosticism belongs to the group of mystical religions. We must
now proceed to define more exactly the peculiar and distinctive character of the Gnostic system. The basis of the Gnostic religion and world-philosophy lies in a decided Oriental dualism. In sharp contrast are opposed the two worlds of the good and of the evil, the divine world and the material world (Δαίμονες), the worlds of light and of darkness. In many systems there seems to be no attempt to derive the one world from the other. The true Basilides (q.v.), perhaps also Sætorini, Marcion and a part of his disciples, Bardesanes and others, were frankly dualists.

In the case of other systems, owing to the inexactness of our information, we are unable to decide; the later the Manichaean system and St. Paul's Min. Aram. and other systems, Mandaism and Manichaeanism, so closely related to Gnosticism, are also based upon a decided dualism. And even when there is an attempt at reconciliation, it is still quite clear how strong was the original dualism which has to be overcome. Thus the Gnostic systems make great use of the idea of a fall of the Deity himself; by the fall of the Godhead into the world of matter, this matter, previously insensible, is animated into life and activity, and then arise the powers, both partly and wholly hostile, who hold sway over this world. Such figures of fallen divinities, sinking down into the world of matter are those of Sophia, (i.e. Abamoth) among the Gnostics (Opobites) in the narrower sense of the word, the Simoniani (the figure of Helena), the Barbelognostics, and in the system of the Pilatus-Sophia or the Primal Man, among the Naasseni and the sect, related to them, as described by Hippolytus.1 A further weakening of the dualism is indicated when, in the systems of the Valentinian school, the fall of Sophia takes place within the godhead, and Sophia, inflamed with love, plunges into the bythos, the highest divinity, and when the attempt is thus made genetically to derive the lower world from the sufferings and passions of fallen divinity. Another attempt at reconciliation is set forth in the so-called "system of emanations" in which it is assumed that from the supreme divinity emanated a somewhat lesser world, from this world a second, and so on, until the divine element (of life) became so far weakened and attenuated, that the genesis of a partly, or even wholly, evil world appears both possible and comprehensible. A system of emanations of this kind, in its purest form, is set forth in the expositions coming from the school of Basilides, which are handed down by Irenaeus, while the propositions which are set forth in the "Philosophumena" of Hippolytus as being doctrines of Basilides represent a still closer approach to a monistic philosophy.

Occasionally, too, there is an attempt to establish at any rate a threefold division of the world, and to assume between the worlds of light and darkness a middle world connecting the two; this is clearest among the Sethiani mentioned by Hippolytus (and cf. the Gnostics in Irenaeus i. 30. 1). Quite peculiar in this connexion are the accounts in Books xix. and xx. of the Clementine Homilies. After a preliminary examination of all possible different attempts at a solution of the problem of evil, the attempt is here made to represent the devil as an instrument of God. Christ and the devil are the two hands of God, Christ the right hand, and the devil the left, the devil having power over this world-epoch and Christ over the next. The devil here assumes very much the characteristics of the punishing and just God of the Old Testament, and the prospect is even held out of his ultimate pardon. All these efforts at reconciliation show how clearly the problem of evil was realized in these Gnostic and half-Gnostic sects, and how deeply they meditated on the subject; it was not altogether without reason that in the ranks of its opponents Gnosticism was judged to have arisen out of the question, πῶς ἐν τῷ καταν.;

This dualism had not its origin in Hellenic soil, neither is it related to that dualism which to a certain extent existed also in late Greek religion. For the lower and imperfect world, which in that system too is conceived and assumed, is the nebulous world of the non-existent and the formless, which is the necessary accompaniment of that which exists, as shadow is of light.

In Gnosticism, on the contrary, the world of evil is full of active energy and hostile powers. It is an Oriental (Iranian) dualism which here finds expression, though in one point, it is true, the mark of Greek influence is quite clear. When Gnosticism recognizes in this corporeal and material world the true seat of evil, consistently treating the bodily existence of mankind as essentially evil and the separation of the spiritual from the corporeal being as the object of salvation, this is an outcome not only of Greek dualism between spirit and matter, soul and body. For in Oriental (Persian) dualism it is within this material world that the good and evil powers are at war, and this world beneath the stars is by no means conceived as entirely subject to the influence of evil. Gnosticism has combined the two, the Greek opposition between spirit and matter, and the sharp Zoroastrian dualism, which, where the Greek mind conceived of a higher and a lower world, saw instead two hostile worlds, standing in contrast to each other like light and darkness. And out of the combination of these two dualisms arose the teaching of Gnosticism, with its thoroughgoing pessimism and fundamental asceticism.

Another characteristic feature of the Gnostic conception of the universe is the rôle played in almost all Gnostic systems by the seven world-creating powers. There are indeed certain exceptions; for instance, in the systems of the Valentinian schools there is the figure of the one Demiurge who takes the place of the Seven. But how widespread was the idea of seven powers, who created this lower material world and rule over it, has been clearly proved, especially by the systematic examination of the subject by Anz ("Urspruncl des Gnosticismus"). These Seven, then, are in most systems half-evil, half-hostile powers; they are frequently characterized as "angels," and are reckoned as the last and lowest emanations of the Godhead; below them—and frequently considered as derived from them—comes the world of the actually devilish powers. On the other hand, among the speculations of the Mandaecans, we find a different and perhaps more primitive conception of the Seven, according to which they, together with their father Namrus (Rûhûl) and their father (Ur), belong entirely to the world of darkness. They and their family are looked upon as captives of the god of light (Manda-d'hayê, Hibil-Ziûd), who pardons them, sets them on chariots of light, and appoints them as rulers of the world (cf. chiefly Genza, in Tractat 6 and 8; W. Brandt, Mandäische Schriften, 135 seq. and 137 seq.; Mandäische Religion, 34 seq., &c.). In the Manichaean system it is related how the helper of the Primal Man, the spirit of light, captured the evil archontes, and fastened them to the firmament, or according to another account, flayed them, and formed the firmament from their skin (F. C. Baur, Das manichaischen Religionssystem, v. 65), and this conception is closely related to the other, though in this tradition the number (seven) of the archontes is lost. Similarly, the last book of the Pilis-Sophia contains the myth of the capture of the rebellious archontes, whose leaders here appear as five in number (Schmidt, Köptisch-gnostische Schriften, p. 234 seq.).1 There can scarcely be any doubt as to the origin of these seven (five) powers; they are the seven planetary divinities, the sun, moon and five planets.

In the Mandaean speculations the Seven are introduced with the Babylonian names of the planets. The connexion of the Seven with the planets is also clearly established by the expositions of Celcus and Origen (Contra Celsum, v. 22 seq.) and similarly by the above-quoted passage in the Pilis-Sophia, where the archontes, who are here mentioned as five, are identified with the five planets (excluding the sun and moon). This collective grouping of the seven (five) planetary divinities is derived from the late Babylonian religion, which can definitely be indicated as one of the home ideas of these works (Zimmern, Keilschriften in dem alten Testament, ii. p. 620 seq.; cf. particularly Diodorus ii. 30).

And if in the old sources it is only the first beginnings of this development that can be traced, we must assume that at a later

1 Cf. the same idea of the fall of mankind in the pagan Gnosticism of "Poimandres"; see Reitzenstein, Poimandres (1903); and the position of the Primal Man (Urmenstch) among the Manichaecans is similar.

2 These ideas may possibly be traced still further back, and perhaps even underlie St. Paul's exposition in Col. ii. 15.
period the Babylonian religion centred in the admiration of the seven planetary deities. Very instructive in this connection is the later (Arabian) account of the religion of the Mesopotamian Sabaens. The religion of the Sabaens, evidently a later offshoot from the stock of the old Babylonian religion, actually consists in the cult of the seven planets (cf. the great work of Daniel Chwolson, *Die Sechbor. u. der Saalismus*). But this reference to Babylonian religion does not solve the problem which is here in question. For in the Babylonian religion the planetary constellations are reckoned as the supreme deities. And here the question arises, how it came about that in the Gnostic systems the Seven appear as subordinate, half-daemonic powers, or even completely as powers of darkness. This can only be explained on the assumption that some religion hostile to, and stronger than the Babylonian, has superimposed itself upon this, and has degraded its principal deities into daemons. Which religion can this have been? We are at first inclined to think of Christianity itself, but it is certainly most improbable that at the time of the rise of Christianity the Babylonian teaching about the seven planet-deities governing the world should have played so great a part throughout all Syria, Asia Minor and Egypt, that the most varying sections of syncretic Christianity should over and over again adopt this doctrine and work it up into their system. It is far more probable that the combination which we meet with in Gnosticism is older than Christianity, and was found already in existence by Christianity and its sects. We must also reject the theory that this degradation of the planetary deities into daemons is due to the influence of Hebrew monotheism, for almost all the Gnostic sects take up a definitely hostile attitude towards the Jewish religion, and almost always the highest divinity among the Seven is actually the creator-God of the Old Testament. There remains, then, only one religion which can be used as an explanation, namely the Persian, which in fact fulfils all the necessary conditions. The Persian religion was at an early period brought into contact with the Babylonian, through the triumphant progress of Persian culture towards the West; at the time of Alexander the Great it was already the prevailing religion in the Babylonian plain (cf. F. Cumont, *Testes et monuments relatifs aux mystères de Mithra*, i. 5, 8-10, 14, 243 seq., 233). It was characterized by a main belief, tending towards monothelism, in the Light-deity Ahuramazda and his satellites, who appeared in contrast with him as powers of the nature of angels.

A combination of the Babylonian with the Persian religion could only be effected by the degradation of the Babylonian deities into half-divine, half-daemonic beings, infinitely remote from the supreme God of light and of heaven, or even into powers of darkness. Even the characteristic dualism of Gnosticism has already proved to be in part of Iranian origin; and now it becomes clear to us how from that mingling of late Greek and Persian dualism the idea could arise that these seven half-daemonic powers are the creators or rulers of this material world, which is separated infinitely from the light-world of the good God. Definite confirmation of this conjecture is afforded us by later sources of the Iranian religion, in which we likewise meet with the characteristic fundamental doctrine of Gnosticism. Thus the *Bundahish* (iii. 25, v. 1) is able to inform us that in the primeval strife of Satan against the light-world, seven hostile powers were captured and set as constellations in the heavens, where they are guarded by good star-powers and prevented from doing harm. Five of the evil powers are the planets, while the sun and moon are of course not reckoned among the evil powers—for the obvious reason that in the Persian official religion they invariably appear as good deities (cf. similar ideas in the Arabic treatise on Persian religion Ulema-i-Islam, Vullers, *Fragmente über die Religion Zoroasters*, p. 49, and in other later sources for Persian religion, put together in Spiegel, *Eranische Allertumskunde*, Bd. ii. p. 180). These Persian fancies can hardly be borrowed from the Christian Gnostics or the Manichaens. The definitive and much more strongly dualistic character recalling the exposition of the Manichaean (and Manichaean) system, are proofs to the contrary. They are derived from the same period in which the underlying idea of the Gnostic systems also originated, namely, the time at which the ideas of the Persian and Babylonian religions came into contact, the remarkable results of which have thus partly found their way into the official documents of Parseism.

With this fundamental doctrine of Gnosticism is connected, as Anz has shown in his book which we have so often quoted, a side of their religious practices to which we have already alluded. Gnosticism is of great extent the form by which it is shown that it is above all and in the highest degree important for the Gnostic’s soul to be enabled to find its way back through the lower worlds and spheres of heaven ruled by the Seven to the kingdom of light of the supreme deity of heaven. Hence, a principal item in their religious practice consisted in communications about the being, nature and names of the Seven (or of any other hostile daemons barring the way to heaven), the formulas with which they must be addressed, and the symbols which must be shown to them. But names, symbols and prayers not efficacious by themselves: the Gnostic must lead a life having no part in the lower world ruled by these spirits, and by his knowledge he must raise himself above them to the God of the world of light. Throughout this mystic religious world it was above all the influence of the late Greek religion, derived from Plato, that also continued to operate; it is filled with the echo of the song, the first note of which was sounded by the Platonists, about the heavenly home of the soul and the homeward journey of the wise to the higher world of light.

But the form in which the whole is set forth is Oriental, and it can be carefully noted that the Mithras mysteries, so closely connected with the Persian religion, are acquainted with this doctrine of the ascent of the soul through the planetary spheres (Origen, *Contra Celsum*, vi. 22).

V. We cannot here undertake to set forth and explain in detail all the complex varieties of the Gnostic systems; but it will be useful to take a nearer view of certain principal figures which have had an influence upon at least one series of Gnostic systems, and to examine their origins in the history of religion. In almost all systems an important part is played by the Great Mother (ēphōra) of the supreme divinity. The sect of the Barbelognostics takes its name from the female figure of the Barbelo-gnostic formula, the *Ogroulenn* (in the letters of the ship “virgin” in *Epiphanius, Icar. xxv. 1*). But Gnostic speculation gives various accounts of the descent or fall of this goddess of heaven. Thus the “Helena” of the Simonians descends to this world in order by means of her beauty to provoke to sensual passion and mutual strife the angels who rule the world, and thus again to deprive them of the powers of light, stolen from heaven, by means of which they rule over the world. She is then held captive by them in extreme degradation. Similar ideas are to be found among the “Gnostics” of Epiphanius. The kindred idea of the light-maiden, who, by exciting the sensual passions of the rulers (*phōores*), takes from them those powers of light which still remain to them, has also a central place in the Manichaean scheme of salvation (F. C. Baur, *Das manichäische Religionsystem*, pp. 219, 315, 321). The light-maiden also plays a prominent part in the *Pistis-Sophia* (cf. the index to the translation by C. Schmidt). With this figure of the mother-goddess who descends into the lower world seems to be closely connected the idea of the fallen Sophia, which is so widespread among the Gnostic systems. This Sophia then is certainly no longer the dominating figure of the light-world, she is a lower soul at the extreme limit of the world of light, who sinks down into matter (Barbelognostics, among the anonymous Gnostic of Irenaeus,
Gnosticism

Bardeanes, *Pistis-Sophia*, or turns in promptuous love towards the supreme God (Bhūta), and thus brings the Fall into the world of the aeons (Valentinians). This Sophia then appears as the mother of the “seven” gods (see above).

The origin of this figure is not far to seek. It is certainly not derived from the Persian religious system, to the spirit of which it is entirely opposed. Neither would it be correct to identify her entirely with the great goddess Ishtar of the old Babylonian religion. But there can hardly be any doubt that the figure of the great mother-goddess or goddess of heaven, who was worshipped throughout Asia under various forms and names (Astarte, Beltis, Atargatis, Cybele, the Syrian Aphrodite), was the mother of the male god Adamos (Father of the Gods). The character of this great goddess of heaven is still in many places fairly exactly preserved in the Gnostic speculations. Hence we are able to understand how the Gnostic μητρος, the Sophia, appears as the mother of the Hebdomas (ץביוואס). The great goddess of heaven is the mother of the stars. Particularly instructive in this connexion is the fact that in those very sects, in the systems of which the figure of the μητρος plays a special part, unbridled prostitution appears as a distinct and essential part of the cult (cf. the accounts of partial prostitution in the marches of the Gnostics, Borborites, &c. in Epiphanius, *Haer.* xxv., xxvi.). The meaning of this is, of course, reinterpreted in the Gnostic sense: by this unbridled prostitution the Gnostic sects desired to prevent the sexual propagation of mankind, the origin of all evil. But the connexion is clear, and hence it also explained the curious Gnostic myth mentioned above, namely that the μητρος (the light-maiden) by appearing to the archontes (אפ inout), the lower powers of this world, inflames them to sexual lusts, in order to take from them that share of light which they have stolen from the upper world. This is a Gnostic interpretation of the various myths of the great mother-goddess’s many loves and love-adventures with other gods and heroes. And when the pagan legend of the Syrian Astarte tells how she lived for ten years in Tyre as a prostitute, this directly recalls the Gnostic myth of how Simon found Helena in a brothel in Tyre (Epiphanius, *Ancoratus*, c. 104). From the same group of myths must be derived the idea of the goddess who descends to the under-world, and is there taken prisoner against her will by the lower powers; the direct prototype of this myth is to be found, e.g. in Ishtar’s journey to hell. And finally, as the mother-goddess of south-western Asia stands in particularly intimate connexion with the youthful god of spring (Tammuz, Adonis, Attis), so we ought perhaps to compare here as a parallel the relation of Sophia with the Soter in certain Gnostic systems (see below).

Another characteristic figure of Gnosticism is that of the Primal Man (*φλορος θεραπτωρος*). In many systems, certainly, it has already been forced quite into the background. But on closer examination we can clearly see that it has a wide influence on Gnosticism. Thus in the system of the Naassene (see Hippolytus, *Philosophumenon*), and in certain related sects there enumerated, the Primal Man has a central and predominant position. Again, in the text on which are based the pseudo-Clementine writings (*Recoginitions*, i. 16, 32, 45-47, 52, ii. 47; and *Homilies*, iii. 17 seq. xviii. 14), as in the closely related system of the Ebionites in Epiphanius (*Haer.* xxx. 3-16; cf. liii. i), we meet with the man who existed before the world, the prophet who goes through the world in various forms, and finally reveals himself in Christ. Among the Barbelogists (Irenaeus i. 29. 3), the Primal Man (Adamas, *homo perfectus et verus*) and Gnosis appear as a pair of *aeons*, occupying a prominent place in the whole series. In the Valentinian systems the pair of aeons, Anthropos and Ekklesia, occupy the third or fourth place within the *Oydoes*, but incidentally we learn that with some representatives of this school the Anthropos took a still more prominent place (first or second; Hilgenfeld, *Ketzergeschichte*, p. 294 seq.). And even in the *Pistis-Sophia* the Primal Man “Iesu” is frequently alluded to as the King of the Luminaries (cf. index to C. Schmidt’s translation). We also meet with speculations of this kind about man in the circles of non-Christian Gnosis. Thus in the *Poimandres* of Hermes man is the most prominent figure in the speculation; in some pagan and half-pagan parallels (the “Gnostics” of Plotinus, Zosimus, Bitsys) have been collected by Reitzenstein in his work *Poimandres* (pp. 81-116). Reitzenstein has shown (p. 81 seq.) that very probably the system of the Naassene ascribed by Hippolytus was originally derived from purely pagan circles, which are probably connected in some way with the mysteries of the Attis cult. The figure in the Mandaean system most closely corresponding to the Primal Man, though this figure also actually occurs in another part of the system (cf. the figure of Adakas Mana; Brandt, *Mandäische Religion*, p. 36 seq.) is the *Astarte* (Baur, *Religionsgeschichte*, i. 596; cf. also the figures of Adamas and Gnosis, among the Barbelogists, in Irenaeus i. 20. 3). Finally, in the Manichean system, as is well known, the Primal Man again assumes the predominant place (Baur, *Manich. Religionsystem*, 49 seq.).

This figure of the Primal Man can particularly be compared with that of the Gnostic Sophia. Wherever this figure has not become quite obscure, it represents that divine power which, whether simply owing to a fall, or as the hero who makes war on, and is partly vanquished by darkness, descends into the world, and is finally victorious, in the great drama of the world’s development. From this power are derived those portions of light existing and held prisoner in this lower world. And as he has raised himself again out of the material world, or has been set free by higher powers, so shall also the members of the Primal Man, the portions of light still imprisoned in matter, be set free.

The question of the derivation of the myth of the Primal Man is still one of the unsolved problems of religious history. It is worthy of notice that according to the old Persian myth the development of the world begins with the slaying of the primal man Gayomart by Angra-Mainyu (Ahriman); further, that the Primal Man (“son of man” = man) also plays a part in Jewish apocalyptic literature (Daniel, Enoch, iv. Ezra), whence this figure passes into the Gospels; and again, that the dogma of Christ’s descent into hell is directly connected with this myth. But these parallels do not carry us much further. Even the Persian myth is entirely obscure, and has hitherto defied interpretation. It is certainly true that in some way an essential part in the formation of the myth has been played by Judaism, and that it is only the metaphorical and mythical description of the great god of Babylon that has been originally set forth in it again victoriously. But how to explain the combination of the figure of the sun-god with that of the Primal Man is an unsolved riddle. The meaning of this figure in the Gnostic speculations is, however, clear. It answers the question: how did the portions of light to be found in this lower world, among which certainly belong the souls of the Gnostics, enter into it? A parallel myth to that of the Primal Man are the accounts to be found in most of the Gnostic systems of the creation of the first man. In all these accounts the idea is expressed that so far as his body is concerned man is the work of the angels who created the world. So e.g. Satornil relates (Irenaeus i. 24. 1) that a brilliant vision appeared from above to the world-creating angels; they were unable to hold it fast, but formed man after its image. And as the man thus formed was unable to move, but could only crawl like a worm, the supreme Power put into him a spark of life, and man came into existence. Imaginations of the same sort are also to be found, e.g. in the genuine fragments of Valentinus (Hilgenfeld, *Ketzergeschichte*, p. 293), the Gnostics of Irenaeus i. 30. 6, the Mandaeans (Brandt, *Religion der Mandäer*, p. 36), and the Manicheans (Baur, *Religionsystem*, p. 118 seq.). The Naassene (Hippolytus, *Philosophumenon*, v. 7) expressly characterize the myth as Chaldean (cf. the passage from Zosimus, in Reitzenstein’s *Poimandres*, p. 104). Clearly then the question which the myth of the Primal Man is intended to answer in relation to the whole universe is answered in relation to the nature of man by this account of the coming into being of the first man, which may, moreover, have been influenced by the account in the Old Testament. That question is: how does it happen that in this
Gnosticism within the Christian religion, and its significance for the development of the latter. Above all the Gnostics represented and developed the distinctly anti-Jewish tendency in Christianity. Paul was the apostle whom they reverenced, and his spiritual influence on them is quite unmistakable. The Gnostic Marcion has been rightly characterized as a direct disciple of Paul. Paul’s battle against the law and the narrow national conception of Christianity found a willing following in a movement, the syncretic origin of which directed it towards a universal religion. St Paul’s ideas were here developed to their extremest consequences in an entirely one-sided fashion such as was far from being in his intention. In nearly all the Gnostic systems the doctrine of the seven world-creating spirits is given an anti-Jewish tendency, the god of the Jews and of the Old Testament appearing as the highest of the seven. The demijure of the Valentinians always clearly bears the features of the Old Testament creator-God.

The Old Testament was absolutely rejected by most of the Gnostics. Even the so-called Judaico-Christian Gnostics (Cerinthus), the Ebionite (Essenian) sect of the Pseudo-Clementine writings (the Elkesaikes), take up an inconsistent attitude. In the Gnosticism of the Valentinians, for example, this opposition to Gnosticism led to a reactionary movement. If the growing Christian Church, in quite a different fashion from Paul, laid stress on the literal authority of the Old Testament, interpreted, it is true, allegorically; if it took up a much more friendly and definite attitude towards the Old Testament, and gave wider scope to the legal conception of religion, this must be in part ascribed to the involuntary reaction upon it of Gnosticism.

The attitude of Gnosticism to the Old Testament and to the creator-god proclaimed in it had its deeper roots, as we have already seen, in the dualism by which it was dominated. With this dualism and the recognition of the worthless and absolutely vicious nature of the material world is combined a decided spiritualism. The conception of a resurrection of the body, of a further existence for the body after death, was unattainable by almost all of the Gnostics, with the possible exception of a few Gnostic sects dominated by Judaico-Christian tendencies. With the dualistic philosophy is further connected an attitude of absolute indifference towards this lower and material world, and the practice of asceticism. Marriage and sexual propagation are considered either as absolute Evil or as altogether worthless, and carnal pleasure is frequently looked upon as forbidden. Then again asceticism sometimes changes into wild libertinism. Here again Gnosticism has exercised an influence on the development of the Church by way of contrast and opposition. If here a return was made to the old material-view of the resurrection (the apostolic ἀναγέννησις τῆς σαρκός), entirely abandoning the more spiritual conception which had been arrived at as a compromise by Paul, this is probably the result of a reaction from the views of Gnosticism. It was just at this point, too, that Gnosticism started a development which was followed later by the Catholic Church. In spite of the rejection of the ascetic attitude of the Gnostics, as a blasphemy against the Creator, a part of this ascetic principle became at a later date dominant throughout all Christendom. And it is interesting to observe how, e.g., St Augustine, though desperately combating the dualism of the Manichaeans, yet afterwards introduced a number of dualistic ideas into Christianity, which are distinguishable from those of Manichaeism only by a very keen eye, and even then with difficulty.

The Gnostic religion also anticipated other tendencies. As we have seen, it is above all things a religion of sacraments and mysteries. Through its syncretic origin Gnosticism introduced for the first time into Christianity a whole mass of sacramental, mystical ideas, which had hitherto existed in it only in its earliest phases. But in the long run even genuine Christianity has been unable to free itself from the magic of the sacraments; and the Eastern Church especially has taken the same direction as Gnosticism. Gnosticism was also the pioneer of the Christian Church in the strong emphasis laid on the idea of salvation in
Gnosticism was a philosophy and system of religious beliefs that originated in the 1st century AD. It was based on the idea that there was a profound dualism in the world, with a spiritual realm of the highest reality and a material realm of illusion and suffering. The Gnostics believed in the existence of a supreme being, the Holy Father, who created the material world as a test. They also believed in the existence of an inner spiritual world, which could be accessed through knowledge and enlightenment.

Gnosticism was most prominent in Egypt, where it was associated with the Ophites, a group of ascetics who lived in caves and were known for their strict asceticism. The Ophites were associated with a figure named Simon, who is believed to have been the head of the Gnostic movement.

The Gnostics believed in the existence of a higher reality, which they called the Demiurge, who was responsible for creating the material world. The Gnostics believed that by gaining knowledge of this higher reality, one could achieve salvation and liberation.

The Gnostics had a complex system of beliefs, which varied depending on the group. Some Gnostics believed in the existence of a personal God, while others believed in a more impersonal, cosmic God.

Gnosticism was also associated with the belief in the existence of a secret knowledge, which was passed down through oral tradition. This secret knowledge was believed to be the key to understanding the higher reality and achieving salvation.

Gnosticism was eventually suppressed by the early Christian Church, which saw it as a threat to its own authority. However, its influence can still be seen in various religious traditions, including some forms of Christianity and the Gnostic religion that developed in the 2nd and 3rd centuries AD. 
of attraction that it now drew within its limits even Judaeo-Christian sects. Among those we must mention the Judaeo-Christian Gnostic Cerinthus, also the Gnostic Ebionites, of whom Epiphanius (Haer.) gives us an account, and whose writings are to be found in a recension in the collected works of the Pseudo-Clementine Recognitions and Homilies; to the same class belong the Elkesiates with their mystical scripture, the Eklat, extracts of which are given by Hippolytus in the Philos. (ix. 13). Later evidence of the decadence of Gnosticism occurs in the Pistas-Sophia and the Coptic Gnostic writings discovered and edited by Schmidt. In these confused records of human imagina- tion gone mad, we possess a veritable herbarium of all possible Gnostic ideas, which were once active and now rest peacefully side by side. None the less, the stream of the Gnostic religion is not yet dried up, but continues on its way; and it is beyond a doubt that the later Manichaeanism and the great religious movement of Mani are most closely connected with Gnosticism. These manifestations are all the more characteristic since in them we meet with a Gnosticism which remained essentially more untouched by Christian influences than the Gnostic systems of the 3rd century a.d. Thus these systems throw an important light on the past, and a true perception of the nature and purpose of Gnosticism is not to be obtained without taking them into consideration.

GNU, the Hottentot name for the large white-tailed South African antelope (q.v.), now nearly extinct, know to the Boers as the black wildebeest, and to naturalists as Connochaetes (or Catoblebas) gns. A second and larger species is the brindled gnu or blue wildebeest (C. taurinus or Catoblephas gargon), also known by the Bechuana name kokon or kokoone; and there are several East African forms more or less closely related to the latter which have received distinct names.

GO, or Go-Bang (Jap. Go-ban, board for playing Go), a popular table game. It is of great antiquity, having been invented in Japan, according to tradition, by the emperor Yao, 2350 B.C., and is probably of Chinese origin. According to Falkener the first historical mention of it was made about the year 300 B.C., but there is abundant evidence that it was a popular game long before that period. The original Japanese Go is played on a board divided into squares by 15 horizontal and 15 vertical lines, making 361 intersections, upon which the flat round men, 181 white and 181 black, are placed one by one as the game proceeds. The men are placed by the two players on any intersections (me) that may seem advantageous, the object being to surround with one's men as many unoccupied intersections as possible, the player enclosing the greater number of vacant points being the winner. Completely surrounded men are captured and removed from the board. This game is played in England upon a board divided into 361 squares, the men being captured upon these instead of upon the intersections.

A much simpler variety of Go, mostly played by foreigners, has for its object to get five men into line. This may have been the earliest form of the game, as the word go means five. Except in Japan it is often played on an ordinary draughts-board, and the winner is he who first gets five men into line, either vertically, horizontally or diagonally.

See Go-Bang, by A. Howard Cady, in Spalding's Home Library (New York, 1896); Games Ancient and Oriental, by Edward Falkener (London, 1892); Das japan-chinesische Spiel Go, by O. Korschelt (Vandsberg, 1881); Das Nationalspiel der Japanesen, by G. Schurig (Leipzig, 1888).

GOA, the name of the past and present capitals of Portuguese India, and of the surrounding territory more exactly described as Goa settlement, which is situated on the western coast of India, between 15° 44' and 14° 53' N., and between 73° 45' and 74° 26' E. Pop. (1900) 475,513, area 1301 sq. m.

Settlement.—With Damaun (q.v.) and Diu (q.v.) Goa settlement forms a single administrative province ruled by a governor-general, and a single ecclesiastical province subject to the archbishop of Goa; for judicial purposes the province includes Macao in China, and Timor in the Malay Archipelago. It is bounded on the N. by the river Terakul or Arandum, which divides it from the Sawantwari state, E. by the Western Ghats, S. by Kanara district, and W. by the Arabian Sea. It comprises the three districts of Ilhas, Bardez and Salsette, conquered early in the 16th century and therefore known as the Velhas Conquistas (Old Conquests), seven districts acquired later and known as the Novas Conquistas, and the island of Anjily or Anjadiva. The settlement, which has a coast-line of 62 m., is a hilly region, especially the Novas Conquistas; its distinguishing features are the Western Ghats, though the highest summits nowhere reach an altitude of 4000 ft., and the island of Goa. Numerous short but navigable rivers water the lowlands skirting the coast. The two largest rivers are the Mandavi and the Juari, which together encircle the island of Goa (Ilhas), being connected on the landward side by a creek. The island (native name Tisvâlî, Tissuvaddy, Tissuary) is a triangular piece, the apex of which, called cabo or cape, is a rocky headland separating the harbour of Goa into two anchorages—Agada or Aguada at the mouth of the Mandavi, on the north, and Mormugão or Marmagão at the mouth of the Juari, on the south. The northern haven is exposed to the full force of the south-west monsoon, and is liable to silt up during the rains. The southern, sheltered by the promontory of Salsette, is always open, but is less used, owing to its greater distance from the city of Goa, which is built on the island. A railway connects Mormagão, south of the Juari estuary, with Castle Rock on the
GOA

Western Ghats. Goa imports textiles and foodstuffs, and exports coco-nuts, areca-nuts, spices, fish, poultry and timber. Its trade is carried on almost entirely with Bombay, Madras, Kathiawar and Portugal. Manganese is mined in large quantities, some iron is obtained, and other products are salt, palm-spirit, betel and bananas.

Cities of Goa.—1. The ancient Hindu city of Goa, of which hardly a fragment survives, was built at the southernmost point of the island, and was famous in early Hindu legend and history for its learning, wealth and beauty. In the Puranas and certain inscriptions its name appears as Gove, Govapuri, Gomant, &c.; the medieval Arabian geographers knew it as Sindbur or Sandibur, and the Portuguese as Goa Velha. It was ruled by the Kadamba dynasty from the 5th to about the 8th century A.D., until 1312, when Mahomedan invaders from the Deccan from 1312 until about 1370, during which period it was visited and described by Ibn Batuta. It was then annexed to the Hindu kingdom of Vijayanagar, of which, according to Ferishta, it still formed part in 1469, when it was conquered by the Bahmanian sultan of the Deccan; but two of the best Portuguese chroniclers state that it became independent in 1440, when the second city (Old Goa) was founded.

2. Old Goa is, for the most part, a city of ruins without inhabitants other than ecclesiastics and their dependents. The chief surviving buildings are the cathedral, founded by Albuquerque in 1511 to commemorate his entry into Goa on St Catherine’s day 1510, and rebuilt in 1623, and still used for public worship; the convent of St Francis (1517), a converted mosque rebuilt in 1661, with a portal of carved black stone, which is the only relic of Portuguese architecture in India dating from the first quarter of the 16th century; the chapel of St Catherine (1551); the church of Bom Jesus (1560–1602), a superb example of Renaissance architecture as developed by the Jesuits, containing the magnificent shrine and tomb of St Francis Xavier (see Xavier, Francis; and the 17th-century convents of St Monica and St Cajetan); the college of St Paul (see below) is in ruins.

3. Panjim, Panjam or New Goa originally a suburb of Old Goa, is, like the parent city, built on the left bank of the Mandovi estuary, in 15° 30’ N. and 73° 33’ E. Pop. (1901) 9500. It is a modern port with few pretensions to architectural beauty. Ships of the largest size can anchor in the river, but only small vessels can load or discharge at the quay. Panjim became the residence of the viceroys in 1750, and the capital of Portuguese India in 1843. It possesses a lyceum, a school for teachers, a seminary, a technical school and an experimental agricultural station.

Political History.—With the subdivision of the Bahmanian kingdom, after 1482, Goa passed into the power of Yusuf Adil Shah, king of Bijapur, who was his ruler when the Portuguese first reached India. At this time Goa was important as the starting-point of pilgrims from India to Mecca, as a mart with no rival except Calicut on the west coast, and especially as the centre of the import trade in horses (Gulf Arabs) from Hormuz, the control of which was a vital matter to the kingdoms warring in the Deccan. It was easily defensible by any power with command of the sea, as the encircling rivers could only be forded at one spot, and had been deliberately stocked with crocodiles. It was attacked on the 10th of February 1510 by the Portuguese under Albuquerque. As a Hindu ascetic had foretold its downfall and the garrison of Ottoman mercenaries was outnumbered, the city surrendered without a struggle, and Albuquerque entered it in triumph, while the Hindu townsfolk strewed filagree flowers of gold and silver before his feet. After two months Yousuf Adil Shah returned with 60,000 troops, forced the passage of the ford, and blockaded the Portuguese in their ships from May to August, when the cessation of the monsoon enabled them to put to sea. In November Albuquerque returned with a larger force, and after overcoming a desperate resistance, recapitulated the city, permitted his soldiers to plunder it for three days, and massacred the entire Mahomedan population.

Goa was the first territorial possession of the Portuguese in Asia. Albuquerque intended it to be a colony and a naval base, as distinct from the fortified factories which had been established in certain Indian seaports. He encouraged his men to marry native women, and to settle in Goa as farmers, retail traders or artisans. These married men soon became a privileged caste, and Goa acquired a large Eurasian population. Albuquerque and his successors left almost untouched the customs and constitutions of the 30 village communities on the island, only abolishing the rite of suttee. A register of these customs (Poral de usos e costumes) was published in 1526, and is an historical document of much value; an abstract of it is given in R. S. Whiteway’s Rise of the Portuguese Empire in India (London, 1898).

Goa became the capital of the whole Portuguese empire in the East. It was granted the same civic privileges as Lisbon. Its senate or municipal chamber maintained direct communications with the king and paid a special representative to attend to its interests at court. In 1563 the governor even proposed to make Goa the seat of a parliament, in which all parts of the Portuguese east were to be represented; this was vetoed by the king.

In 1542 St Francis Xavier mentions the architectural splendour of the city; but it reached the climax of its prosperity between 1575 and 1625. Goa Dourada, or Golden Goa, was then the wonder of all travellers, and there was a Portuguese proverb, “He who has seen Goa need not see Lisbon.” Merchandise from all parts of the East was displayed in its bazaar, and separate streets were set aside for the sale of different classes of goods—Bahrain pearls and coral, Chinese porcelain and silk, Portuguese velvet and piece-goods, drugs and spices from the Malay Archipelago. In the main street slaves were sold by auction. The houses of the rich were surrounded by gardens and palm groves; they were built of stone and painted red or white. Instead of glass, their balconied windows had thin polished oyster-shells set in lattice-work.

The social life of Goa was brilliant, as befitted the headquarters of the viceroyal court, the army and navy, and the church; but the luxury and ostentation of all classes had become a byword before the end of the 16th century. Almost all manual labour was done by slaves; common soldiers assumed high-sounding titles, and it was even customary for the poor noblemen who congregated together in boarding-houses to subscribe for a few silken cloaks, a silken umbrella and a common man-servant, so that each could take his turn to promenade the streets, fashionably attired and with a jewelled escuad. There were huge gambling saloons, licensed by the municipality, where determined players lodged for weeks together; and every form of vice, except drunkenness, was practised by both sexes, although European women were forced to lead a kind of zenann life, and never ventured unveiled into the streets; they even attended at church in their palaquinens, so as to avoid observation.

The appearance of the Dutch in Indian waters was followed by the gradual ruin of Goa. In 1603 and 1609 the city was blockaded by Dutch fleets, though never captured, and in 1635 it was ravaged by an epidemic. Its trade was gradually monopolized by the Jesuits. Thevenot in 1665, Baldeaus in 1672, Fryer in 1675 describes its ever-increasing poverty and decay. In 1683 only the timely appearance of a Mogul army saved it from capture by a horde of Maharrata raiders, and in 1739 the whole territory was attacked by the same enemies, and only saved by the unexpected arrival of a new viceroys with a fleet. This peril was always imminent until 1750, when a peace with the Maharratas was concluded. In the same year the proposal to remove the seat of government to Panjim was carried out; it had been discussed as early as 1664. Between 1665 and 1775 the population dwindled from 20,000 to 1600, and in 1835 Goa was only inhabited by a few priests, monks and nuns.

Ecclesiastical History.—Some Dominican friars came out to Goa in 1510, but no large missionary enterprise was undertaken before the arrival of the Franciscans in 1517. From their headquarters in Goa the Franciscan preachers visited many parts of western India, and even journeyed to Ceylon, Pegu and the Malay Archipelago. For nearly twenty-five years they carried on
the work of evangelization almost alone, with such success that in 1534 Pope Paul III. made Goa a bishopric, with spiritual jurisdiction over all Portuguese possessions between China and the Cape of Good Hope, though itself suffragan to the archbishopric of Funchal in Madeira. A Franciscan friar, João de Albuquerque, came to Goa as vicar apostolic in 1572. In 1542 St Francis Xavier came to Goa, and took over the Franciscan college of Santa Fé, for the training of native missionaries; this was renamed the College of St Paul, and became the headquarters of all Jesuit missions in the East, where the Jesuits were commonly styled Pauquistas. By a Bull dated the 4th of February 1557 Goa was made an archbishopric, with jurisdiction over the sees of Malacca and Cochín, to which were added Macao (1575), Japan (1588), Angamaie and Cranganore (1600), Meliapur (Mylapur) (1609), Bengal (1610), Andaman, Nicobar, and the islands of the South China Sea. Goa, the capital, which includes the entire coast of East Africa. In 1666 the archbishop received the title of Primate of the East, and the king of Portugal was named Patron of the Catholic Missions in the East; his right of patronage was limited by the Concordat of 1827 to Goa, Malacca, Macao and certain parts of British India. The Inquisition was introduced into Goa in 1560; a vivid account of its proceedings is given by C. Dellen, Relation de l’inquisition de Goa (1688). Five ecclesiastical councils, which dealt with matters of discipline, were held at Goa—in 1597, 1575, 1606, 1630 and 1666; the archbishop of Goa also presided over the more important synod of Diamper (Udayamperur, about 12 m. S.E. of Cochín), which in 1590 condemned as heretical the tenets and liturgy of the Indian Nestorians, or Christians of St Thomas (q.v.). In 1675 Fryer described Goa as "a Rome in India, both for absoluteness and fabrics," and Hamilton states that early in the 18th century the number of ecclesiastics in the settlement had reached the extraordinary total of 30,000. But the Jesuits were expelled in 1755, and by 1800 Goa had lost much even of its ecclesiastical importance. The Church of St Francis, Hamiltoned in 1814 and the religious orders were secularized in 1835.

BIBLIOGRAPHY.—J. N. da Fonseca, An Historical and Archaeological Sketch of Goa (Bombay, 1878) is a minute study of the city from the earliest times, illustrated. For the early history of Portuguese rule the chief authorities are The Commentaries... of Duibouquerque (Hakluyt Society’s translation, London, 1877), the Cartas of Albuquerquio (Lisbon, 1894), the Historia... de India of F. L. de Castrochinda (Lisbon, 1853, written before 1552), the Memorias do Conde de Galveis (Lisbon, 1872), the Lendas da India of G. Cores (Lisbon, 1860, written 1514-1566), and the Decadas da India of João de Barros and D. do Couto (Lisbon, 1778-1788, written about 1530-1616), Couto’s Soldado pratico (Lisbon, 1790) and S. Botelho’s Cartas and Tombo, written 1647-1554, were published in “Subsidios” of the Lisbon Academy (1868), are valuable studies of military life and administration. The Archivo Portuguese oriental (6 parts, No. Goa, 1857-1877) is a most useful collection of documents. Goa, the literature from 1415 to 1860 contains the part of the city of Goa, and part 4 contains the minutes of the ecclesiastical councils and of the synod of Diamper. The social life of Goa has been graphically described by many writers; see especially the travels of Vathema (c. 1505), Linschoten (c. 1580), Pyrard (1608) in the Hakluyt Society’s translations; J. Moquet, Voyages (Paris, 1830, written 1686-1610); F. Baldaeus, in Churchills’ Voyages, vol 3 (London, 1732); J. Fryer, A New Account of East India and Persia (London, 1668); A. de Mandeelo, Voyages (London, 1669); Les Voyages de M. de Thunenat aux Isles Orientales (Amsterdam, 1750), and A. Hamilton, A New Account of the East Indies (London, 1774). For Goa in the 20th century see The Imperial Gazetteer of India (K. G. J.)

GOAL—GOAT

GOAL, originally an object set up as the place where a race ends, the winning-post, and so figured up the end of the game. It is used to direct the {Lat. meta, the boundary pillar, set one at each end of the circus to mark the turning-point. The word was quite early used in various senses, which exact use depended on the position of the goal, whether it was a pole, a cross-bar, through or over which the ball had to be driven or so placed towards winning the game. The New English Dictionary quotes the use in Richard Stanyhurst’s Description of Ireland (1577): but the word goal in the sense of a boundary appears as early as the beginning of the 14th century in the religious poems of William de Shoreham (c. 1315). The origin of the word is obscure. It is usually taken to be derived from a French word gout, meaning a pole or stick, but this meaning does not appear in the English usage, nor does the usual English meaning appear in the French. There is an O. Eng. gōdlan, to hinder, which may point to a lost gōl, barrier, but there is no evidence in other Teutonic languages for this word.

GOALPARA, a town and district of British India, in the Brahmaputra valley division of eastern Bengal and Assam. The town (pop. 63,875) overlooks the Brahmaputra. It was the frontier outpost of the Mahommedan power, and has long been a flourishing seat of river trade. The civil station is built on the summit of a small hill commanding a magnificent view of the valley of the Brahmaputra, bounded on the north by the snowy ranges of the Himalayas and on the south by the Garo hills. The native town is built on the western slope of the hill, and the larger portion is subject to inundation from the marshy land which extends in every direction. It has declined in importance since the district headquarters were removed to Dhubri in 1879, and it suffered severely from the earthquake of the 12th of June 1897.

The District comprises an area of 3,061 sq. m. It is situated along the Brahmaputra, at the corner where the river takes its southerly course from Assam into Bengal. The scenery is striking. Along the banks of the river grow clumps of cane and reed; farther back stretch fields of rice cultivation, broken only by the fruit trees surroundings the villages, and in the background rise the forest-clad hills overtopped by the white peaks of the Himalayas. The soil of the hills is of a red ochreous earth, with blocks of granite and sandstone interspersed; that of the plains is of alluvial formation. Earthquakes are common and occasionally severe shocks have been experienced. The Brahmaputra annually inundates vast tracts of country. Numerous extensive forests yield valuable timber. Wild animals of all kinds are found. In 1901 the population was 462,083, showing an increase of 8% in the decade. Rice forms the staple crop. Mustard and jute are also largely grown. The manufactures comprise the making of bricks and tiles, iron and gold and silver ornaments, weaving of silk cloth, basket-work and pottery.

The cultivation of tea has been introduced but does not flourish anywhere in the district. Local trade is in the hands of Marwari merchants, and is carried on at the bazars, weekly kats or markets and periodical fairs. The chief exports are mustard-seed, jute, cotton, timber, lac, silk cloth, indiarubber and tea; the imports, Bengal rice, European piece goods, salt, hardware, oil and tobacco.

Dhubri (pop. 37,375), the administrative headquarters of the district, stands on the Brahmaputra where the river takes its great bend south. It is the termination of the immigration road from North Bengal and of the river steamers that connect with the North Bengal railway. It is also served by the eastern Bengal State railway.

GOAT (a common Teut. word; O. Eng. gōl, Goth. gaits, Mod. Ger. Geiss, cognate with Lat. haedus, a kid), properly the name of the well-known domesticated European ruminant (Capra hircus), which has for all time been regarded as the emblem of everything that is evil, in contradistinction to the sheep, which is the symbol of excellence and purity. Although the more typical goats are markedly distinct from sheep, there is, both as regards wild and domesticated forms, an almost complete gradation from goats to sheep, so that it is exceedingly difficult to define either group. The position of the genus Capra (to all the members of which, as well as some allied species, the name "goat" in its wider sense is applicable) in the family Bovidae is indicated in the article Bovidae, and some of the distinctions between goats and sheep are mentioned in the article Sheep. Here then it will suffice to mention that goats are characterized by the strong and often sores of the males, which are furnished with a beard on the chin; while as a general rule, the horns are present on the middle toes of the fore feet only.

Goats, in the wild state, are an exclusively old-world group, of which the more typical forms are confined to Europe and south-western and central Asia, although there are two outlying species in northern Africa. The wild goat, or pasang, is represented in Europe in the Cyclades and Crete by rather small races,
more or less mingles with domesticated breeds, the Cretan animal being distinguished as *Capra hircus creticus*; but the large typical race *C. h. aegagrus* is met with in the mountains of Asia Minor and Persia, whence it extends to Sind, where it is represented by a somewhat different race known as *C. h. blythi*. The former variety has a shaggy goat, length and beauty, and characterized by their bold scimitar-like backward sweep and sharp front edge, interrupted at irregular intervals by knots or bosses. Domesticated goats have run wild in many islands, such as the Hebrides, Shetland, Canaries, Azores, Ascension and Juan Fernandez. Some of these reverted breeds have developed horns of considerable size, although not showing that regularity of curve distinctive of the wild race. In the Azores the horns are remarkably upright and straight, whence the name of "antelope-goat" which has been given to these animals. The concretions known as *bezoar-stones*, formerly much used in medicine and as antidotes of poison, are obtained from the stomach of the wild goat.

Although there have in all probability been more or less important local crosses with other wild species, there can be no doubt that domesticated goats generally are descended from the wild goat. It is true that many tame goats show spirally twisted horns recalling those of the under-mentioned Asiatic markhor; but in nearly all such instances it will be found that the spiral twists in the opposite direction. Among the domesticated breeds the following are some of the more typical European goats, of which there are several more or less well-marked breeds, differing from each other in length of hair, in colour and slightly in the configuration of the horns. The ears are more or less upright, sometimes horizontal, but never actually pendent, as in some Asiatic breeds. The horns are rather flat at the base and not unfrequently corrugated; they rise vertically from the head, curving to the rear, and are more or less laterally inclined. The colour varies from dirty white to dark-brown, but when pure-bred is never black, which indicates a middle eastern habit. European countries possess more than one description of the common goat. In the British Isles there are two distinct types, one short and the other long haired. In the former the hair is thick and close, with frequently an under-coat resembling wool. The horns are large in the male, and of moderate size in the female, flat at the base and inclining outwards. The head is short and tapering, the forehead flat and wide, and the nose small; while the legs are strong, thick and well covered with hair. The colour varies from white or grey to black, but is frequently fawn, with a dark line down the spine and another across the shoulders. The underside of the body is generally reddish-black, though sometimes grey or pied and occasionally white. The head is long, heavy and ugly, the nose coarse and prominent, with the horns situated close together, often continuing parallel almost to the extremities, being also large, corrugated and pointed. The legs are long and the sides flat, the animal itself being generally gaunt and thin. This breed is peculiar to Ireland, the Welsh being of a similar type, but more often white. The short-haired goat is the English goat proper. Both British breeds, as well as those from abroad, are frequently ornamented with two tassel-like appendages, having a ringlet together in the throat. It has been supposed by many that these are traceable to foreign blood; but although there are foreign breeds that possess them, they appear to pertain quite as much to the English native breeds as to those of distant countries, the peculiarity being mentioned in very old works on the goats of the British Islands. The milk-produce in the common goat as well as other kinds varies greatly with individuals. Irish goats often yield a quantity of milk, but the quality is poor. The goats of France are similar to those of Britain, varying in length of hair, colour and character of horns. The Norwegian breed is frequently white with long hair; it is rather small in size, with small bones, a short rounded body, head small with a prominent forehead, and short, straight, corrugated horns. The facial line is concave. The horns of the males are very large, and curve round after the manner of the wild goat, with a tuft of hair between and in front.

The Maltese goat has the ears long, wide and hanging down below the jaw. The hair is long and cream-coloured. The breed is usually hornless.

The Syrian goat is met with in various parts of the East, in Lower Egypt, on the shores of the Indian Ocean and in Madagascar. The hair and ears are excessively long, the latter so much so that they are sometimes clipped to prevent their being torn by stones or thorny shrubs. The horns are somewhat erect and spiral, with an outward bend.

The Angora goat is often confounded with the Kashmir, but is in reality quite distinct. The principal feature of this breed, of which there are two or three varieties, is the length and quantity of the hair, which has a particularly soft and silky texture, covering the whole body and a great part of the legs with close matted ringlets. The horns of the male differ from those of the female, being directed vertically and in shape, whilst in the female they have a horizontal tendency, somewhat like those of a ram. The coat is composed of two kinds of hair, the one short and coarse and of the character of hair, which lies close to the skin, the other long and curly and of the nature of wool, forming the outer covering. Both are used by the manufacturer, but the exterior portion, which makes up by far the greater bulk, is much the more valuable. The process of shearing takes place in early spring, the average amount of wool yielded by each animal being about 2½ lb. The best quality comes from castrated males, females producing the next best.

The breed was introduced at the Cape about 1864. The Angora is a bad milker and an indifferent mother, but its flesh is better than that of any other breed, and in its native country is preferred to mutton. The kids are born small, but grow fast, and arrive early at maturity. The Kashmir, or rather Tibet, goat has a delicate head, with semi-pendulous ears, which are both long and wide. The hair varies in length, and is coarse and of different colours according to the individual. The horns are very erect, and sometimes slightly spiral, inclining inwards and to such an extent in some cases as to cross. The coat is composed, as in the Angora, of two materials; but in this breed it is the under-coat that partakes of the nature of wool and is valued as an article of commerce. This under-coat, or *puchem*, which is of a uniform greyish-white tint, whatever the colour of the hair may be, is beautifully soft and silky, and of a fluffy description resembling down. It makes its appearance in the autumn, and continues to grow until the following spring, when, if not removed, it falls off naturally; its collection then commences, occupying from eight to ten days. The animal undergoes during that time a process of combing by which all the wool and a portion of the hair, which of necessity comes with it, is removed. The latter is afterwards carefully separated, when the fleece in a good specimen weighs about half a pound. This is the material of which the far-famed and costly shawls are made, which at one time had such a demand that, it is stated, 16,000 looms were kept in constant work at Kashmir in their manufacture. Those goats having a short, neat head, long, thin, ears, a delicate skin, small bones, and a long heavy coat, are for this purpose deemed the best. There are several varieties
possessing this valuable quality, but those of Kashmir, Tibet and Mongolia are the most esteemed.

The Nubian goat, which is met with in Nubia, Upper Egypt and Abyssinia, differs greatly in appearance from those previously described. The coat of the female is extremely short, almost like that of a race-horse, and the legs are long. This breed therefore stands considerably higher than the common goat. One of its peculiarities is the convex profile of the face, the forehead being prominent and the nostrils sunk in, the nose itself extremely small, and the lower lip projecting from the upper. The ears are long, broad and thin, and hang down by the side of the head like a lop-eared rabbit. The horns are black, slightly twisted and very short, flat at the base, pointed at the tips, and recumbent on the head. Among goats met with in England a good many show signs of a more or less remote cross with this breed, derived probably from specimens brought from the East on board ships for supplying milk during the voyage.

The Theban goat, of the Sudan, which is hornless, displays the characteristic features of the last in an exaggerated degree, and in the form of the head and skull is very sheep-like.

The Nepal goat appears to be a variety of the Nubian breed, having the same arched facial line, pendulous ears and long legs. The horns, however, are more spiral. The colour of the hair, which is longer than in the Nubian, is black, grey or white, with black blotches.

Lastly the Guinea goat is a dwarf breed originally from the coast whence its name is derived. There are three varieties. Besides the commonest *Capra recurva*, there is a rarer breed, *Capra depressa*, inhabiting the Mauritius and the islands of Bourbon and Madagascar. The other variety is met with along the White Nile, in Lower Egypt, and at various points on the African coast of the Mediterranean.

As regards wild goats other than the representatives of *Capra hircus*, the members of the ibex-group are noticed under *Inex*, while another distinctive type receives mention under *Markhor*. The ibex are connected with the wild goat by means of *Capra nubiana*, in which the front edge of the horns is thinner than in either the European *C. ibex* or the Asiatic *C. sibirica*; while the Spanish *C. pyrenaica* shows how the ibex-type of horn may pass into the spirally twisted one distinctive of the markhor, *C. falconeri*. In the article *Ibex* mention is made of the Caucasus ibex, or tur, *C. caucasica*, as an aberrant member of that group; but beside this animal the Caucasus is the home of another very remarkable goat, or tur, known as *C. pallasii*. In this ruminant, which is of a dark-brown colour, the relatively smooth black horns diverge outwards in a manner resembling those of the bharal among the sheep rather than in goat-fashion; and, in fact, this tur, which has only a very short beard, is so bharal-like that it is commonly called by sportsmen the Caucasian bharal.

It is one of the species which render it so difficult to give a precise definition of either sheep or goats.

The short-horned Asiatic goats of the genus *Hemitragus* receive mention in the article *Tahr*; but it may be added that fossil species of the same genus are known from the Lower Pliocene formations of India, which have also yielded remains of a goat allied to the markhor of the Himalayas. The Rocky Mountain goat (*q.v.*) of America has no claim to be regarded as a member of the goat-group.

For full descriptions of the various wild species, see R. Lydekker, *Wild Oxen, Sheep, and Goats* (London, 1898).

**GOATSUCKER**, a bird from very ancient times absurdly believed to have the habit implied by the common name it bears in many European tongues besides English—as testified by the Gr. *alybathas*, the Lat. *caprimulgus*, Ital. *succiacapre*, Span. *etolacabras*, Fr. *tellechère*, and Ges. *Zeigenmelker*. The common goatsucker (*Caprimulgus europaeus*, Linn.), is admittedly the type of a very peculiar and distinct family, *Caprimulgidae*, a group remarkable for the flat head, enormously wide mouth, large eyes, and soft, pencilled plumage of its members, which vary in size from a lark to a crow. Its position has been variously assigned by systematists. Though now judiciously removed from the *Passeres*, in which Linnaeus placed all the species known to him, Huxley considered it to form, with two other families—the swifts (*Cypselidae*) and humming-birds (*Trochilidae*)—the division *Cypselomorphae* of his larger group *Aegithagnathae*, which is equivalent in the main to the Linnaean *Passeres*. There are two ways of regarding the *Caprimulgidae*—one including the genus *Podargus* and its allies, the other recognizing them as a distinct family, *Podargidae*. As a matter of convenience we shall here comprehend these last in the *Capri-* *mulgidae*, which will then contain two subfamilies, *Caprimulginae* and *Podarginae*; for what, according to older authors, constitutes a third, though represented only by *Steatornis*, the singular oil-bird, or guacharo, certainly seems to require separation as an independent family (see *Guacharo*).

Some of the differences between the *Caprimulginae* and *Podarginae* have been pointed out by Sclater (*Proc. Zool. Soc.*, 1866, p. 123), and are very obvious. In the former, the outer toes have *four* phalanges only, thus presenting a very uncommon character among birds, and the middle claws are pectinated; while in the latter the normal number of five phalanges is found, and the claws are smooth, and other distinctions more recondite have also been indicated by him (*loc. cit., p. 582*). The *Capri-* *mulgidae* may be further divided into those having the gape thickly beset by short bristles, and those in which there are few such bristles or none—the former containing the genera *Caprimulgus*, *Antrostomus*, *Nyctidromus* and others, and the latter *Podargus*, *Chordeiles*, *Lyncornis* and a few more.

The common goatsucker of Europe (*C. europaeus*) arrives late in spring from its winter-retreat in Africa, and its presence is soon made known by its habit of chasing its prey, consisting chiefly of moths and cockchafers, in the evening-twilight. As

![Nubian Goat](image)

**Fig. 2.—Nubian Goat.**

![Common Goatsucker](image)
the season advances the song of the cock, from its singularity, attracts attention amid all rural sounds. This song seems to be always uttered when the bird is at rest, though the contrary has been asserted, and is the continuous repetition of a single burring note, as of a thin thath fixed at one end and in a state of vibration at the other, and loud enough to reach in still weather a distance of half-a-mile or more. On the wing, while toying with its mate, or performing its rapid evolutions round the trees where it finder-hocks, to the habit of occasionally producing another and equally extraordinary sound, sudden and short, but somewhat resembling that made by swinging a thong in the air, though whether this noise proceeds from its mouth is not ascertained.

In general its flight is silent, but at times when disturbed from its repose, its wings may be heard to smite together.

The goatsucker, or, to use perhaps its commoner English name, nightjar,1 passes the day in slumber, crouching on the ground or perching on a tree—in the latter case sitting not across the branch but lengthways, with its head lower than its body.

In hot weather, however, its song may sometimes be heard by day and even at noontide, but it is then uttered, as it were, drowsily, and without the vigour that characterizes its crepuscular or nocturnal performance. Towards evening the bird becomes active, and it seems to pursue its prey throughout the night uninterrupted, or only occasionally pausing for a few seconds to alight on a bare spot—a pathway or road—and then resuming its career. It is one of the few birds that absolutely make no nest, but lays its pair of beautifully-marbled eggs on the ground, generally where the herbage is short, and often actually on the soil. So light is it that the act of brooding, even where there is some vegetable growth, produces no visible depression of the grass, moss or lichens on which the eggs rest, and the finest sand equally fails to exhibit a trace of the parental act. Yet scarcely any bird shows greater local attachment, and the precise site chosen one year is almost certain to be occupied the next. The young, when hatched with dark-spotted down, are not easily found, nor are they more easily discovered on becoming fledged, for their plumage almost entirely resembles that of the adults, being a mixture of reddish-brown, grey and black, blended and mottled in a manner that passes description.

They soon attain their full size and power of flight, and then take to the same manner of life as their parents. In autumn all leave their summer haunts for the south, but the exact time of their departure has hardly been ascertained. The habits of the nightjar, as thus described, seem to be more or less essentially those of the whole subfamily—the differences observable being apparently less than are found in other groups of birds of similar extent.

The second species of goatsucker (C. ruficolis), which is some what larger, and has the neck distinctly marked with rufous, is a summer visitor to the south-western parts of Europe, and especially to Spain and Portugal. The occurrence of a single example of this bird at Killingworth, near Newcastle-on-Tyne, in October 1836, has been recorded by Mr Hancock (Ibis, 1862, p. 39); but the season of its appearance argues the probability of its being but a casual straggler from its proper home. Many other species of Caprimulgus inhabit Africa, Asia and their islands, while this has found its way to Europe; it is not known to this genus is Anodontus, an American group containing many species, of which the chuck-will's-widow (A. carolinensis) and the whip-poor-will (A. vociferus) of the eastern United States (the latter also reaching Canada) are familiar examples. Both these birds take their common name from the cry they utter, and their habits seem to be almost identical with those of the old world goatsuckers. Passing over some other forms which need not here be mentioned, the genus Nyctidromus, though consisting of only one species (N. albicolis) which inhabits Central and part of South America, requires remark, since it has tarsi of sufficient length to enable it to run swiftly on the ground, while the legs of most birds of the family are so short that they can make but a shuffling progress. Heclecttes, with the unique form of wing possessed by the male, needs mention. Notice must also be taken of two African species, referred by some ornithologists to as many genera (Macrodiptrix and Cosmeornings), though probably one genus would suffice for both.

The males of each of them are characterized by the wonderful development of the ninth primary in either wing, which reaches in fully adult specimens the extraordinary length of 17 in. or more. In the form of the bird, the entire drawbacks of the formation of Adam Afzelius, is considered to belong to the west coast of Africa, and the shaft of the elongated remiges is bare for the greater part of its length, retaining the web, in a spatulate form, only near the tip. The latter, to which the specific name of vexillarius was given by John Gould, has been found on the east coast of that continent, and is reported to have occurred in Madagascar and Socotra. In this the remigial streamers do not lose their bars, and as a few of the next quills are also to some extent elongated, the bird, when flying, is said to look as though it had four wings. Specimens of both are rare in collections, and no traveller seems to have had the opportunity of studying the habits of either so as to suggest a reason for this marvellous sexual development.

The second group of Caprimulgidae, those which are but poorly or not at all furnished with rectal bristles, contains about five genera, of which we may particularize Lyncornis of the old world and Cordilirs of the new. The species of the former are remarkable for the tuft of feathers which springs from each side of the head, above and behind the ears, so as to give the bird an appearance like some of the "horned" owls—those of the genus Scops, for example; and remarkable as it is to find certain forms of two families, so distinct as are the Strigidae and the Capri

1 Other English names of the bird are evelaar, fern-owl, chern-owl and wheel-bird—the last from the bird's song resembling the noise made by a spinning-wheel in motion.
among other respects in its mode of nidification, is *Aegithalos*, which belongs also to the Australian sub-region; and farther to the northward, extending throughout the Malay Archipelago and into India, comes *Buteorhynchus*, wherein we again meet with species having aural tufts somewhat like *Lyncornis*. The *Podarginae* are thought by some to be represented in the genus *Podargus*, and a number of genera occur from the eastern and southern parts of Africa, Central America to Brazil. Finally, it may be stated that none of the *Caprimulgidae* seem to occur in Polynesia or in New Zealand, though there is scarcely any other part of the world suited to their habits in which members of the family are not found.

(A.N.)

**Gobat, Samuel** (1799–1879), bishop of Jerusalem, was born at Crémine, Bern, Switzerland, on the 26th of January 1799. After serving in the mission house at Basel from 1823 to 1826, he went to Paris and London, whence, having acquired some knowledge of Arabic and Ethiopic, he went out to Abyssinia under the auspices of the Church Missionary Society. The unsettled state of the country and his own ill health prevented his making much headway; he returned to Europe in 1835 and from 1839 to 1842 lived in Malta, where he supervised an Arabic translation of the Bible. In 1846 he was consecrated Protestant bishop of Jerusalem, under the agreement between the British and Prussian governments (1841) for the establishment of a joint bishopric for Lutherans and Anglicans in the Holy Land. He carried on a vigorous mission among the churchmen and his devoted efforts to make himself useful there. He died in 1863. The name of the Gobelins as dyers cannot be found later than the end of the 17th century. In 1662 the works in the Faubourg Saint-Marcel, with the adjoining grounds, were purchased by Colbert on behalf of Louis XIV, and transformed into a general upholstery manufactory, in which designs both in tapestry and in all kinds of furniture were executed under the supervision of the royal painter, Le Brun. On account of the pecuniary embarrassments of Louis XIV, the establishment was closed in 1694, but it was reopened in 1697 for the manufacture of tapestry used chiefly for royal use and for presents to foreigners. He died in 1693. The name of the Gobelins as dyers cannot be found later than the end of the 17th century. In 1671 the works were again reopened, and in 1767 the factory was totally burned by the Communists. The manufacture is still carried on under the state.

**Gobi** (for which alternative Chinese names are *Sha-mo*, "sand desert," and *Han-hai*, "dry sea"), a term which in its widest significance means the long stretch of desert country that extends from the foot of the Pamirs, in about 77° E., eastward to the Great Khingan Mountains, in 116°–118° E., on the border of Manchuria, and from the foothills of the Altai, the Sayan and the Yablonoi Mountains on the N. to the Astin-tagh or Alyn-tagh and the Nan-shan, the northernmost constituent ranges of the Kuen-lun Mountains, a relatively small area on the east side of the Great Khingan, between the upper waters of the Sungari and the upper waters of the Lou-ho, is also reckoned to belong to the Gobi. On the other hand, geographers and Asiatic explorers prefer to regard the W. extremity of the Gobi region (as defined above), namely, the basin of the Tarim in E. Turkestan, as forming a separate and independent desert, to which they have given the name of Takla-makan. The latter restriction governs the present article, which accordingly excludes the Takla-makan, leaving it for separate treatment. The desert of Gobi as a whole is only very imperfectly known, information being confined to the observations which individual travellers have made from their respective itineraries across the desert. Amongst the explorers to whom we owe such knowledge as we possess about the Gobi, the most important have been Marco Polo (1273–1275), Gerbillon (1688–1698), Ijssbrand Iedes (1692–1694), Lange (1727–1728 and 1736), Fuss and Bunge (1830–1831), Frischke (1868–1873), Pavlov and Matusovski (1870), Ney Elias (1872–1873), N. M. Przhevalsky (1876–1872 and 1867–1872), Zosnover (1875), M. V. Fjodorov (1879–1880), Piotrovsky (1879 and 1880), Count Széchenyi and L. von Loczy (1879–1880), the brothers Grum-Grahamo (1889–1890), P. K. Kozlov (1890–1896 and 1890–1900), V. I. Roborovsky (1894), V. A. Obruchev (1894–1896), Futterer and Holderer (1896), C. E. Bonin (1896 and 1899), Sven Hedin (1897 and 1900–1901), K. Bogdanovich (1898), Ladyghin (1899–1900) and Katsanov (1899–1900).

Geographically the Gobi (a Mongol word meaning "desert")
is the deeper part of the gigantic depression which fills the interior of the lower terrace of the vast Mongolian plateau, and measures over 1,000 m. from S.W. to N.E. and 450 to 600 m. from N. to S., being widest in the west, along the line joining the Baghrash-köl in the north to the Kuruk-tagh, running parallel and close to one another. As they proceed eastward they diverge, sweeping back on N. and S. respectively so as to leave room for the Baghrash-köl. These two range marks the principal limit of the Gobi desert, which extends eastward for nearly twenty degrees of longitude. On its northern side the Chol-tagh descends steeply, and its foot is fringed by a zone of deep depressions, rising from Lakehun (245 ft. below the level of the sea) to Hami (2800 ft. above sea-level). To the south of the Kuruk-tagh lie the desert of Lop, the desert of Kum-tagh, and the valley of the Balunzi-gol. To this great swelling, which arches up gradually decreases in elevation. In 19 E.S.E. the principal range, the Mongols give the name of Ghashn-Gobi or Salt Desert. It is some 80 to 100 m. across from N. to S., and is traversed by a number of minor parallel ranges, ridges and chains of hills, and down its middle descends a very broad valley, the Kuruk-tagh, situated between 3000 to 4500 ft. The Chol-tagh, which reaches an average altitude of 6000 ft., is absolutely sterile, and its northern foot rests upon a natural desert covered with sand, which leads down to the depressions mentioned above.

The Kuruk-tagh is the greatly disintegrated, denuded and wasted relic of a mountain range which formerly was of incomparably greater magnitude. In the latter part of the 19th century and the beginning of the 20th, the Tarim, it consists of two, possibly of three, principal ranges, which, although broken in continuity, run generally parallel to one another, and to which may be assigned four or five smaller chains. These minor ranges, together with the principal ranges, divide the region into a series of long, narrow valleys, mostly parallel to one another and to the enclosing mountain chains, which descend like terraces and give the whole region a step-like profile, and on the other towards the desert of Lop. In many cases these latitudinal valleys are barred transversely by ridges or spurs, generally elevations en masse of the bottom of the valley, where such elevations exist, there is generally found, on the E. side of the transverse ridge, a caudron-shaped depression, which some time or other has been the bottom of a former lake, but is now nearly a dry salt-basin. The surface configuration is in fact markedly similar to that which occurs in the inter-mont latitudinal valleys of the Kuen-lun. The hydrography of the Ghashn-Gobi and the Kuruk-tagh is determined by these channeled arrangements of the latitudinal valleys, the→ 

Desert of Kum-tagh.—This section lies E.S.E. of the desert of Lop, on the other side of the Kara-koshun and its more or less temporary lake, Lop-nor. The depression of the vicinity of the town of Sa-chow and the lake of Kara-nor or Kala-chi. Its southern rim is marked by a labyrinth of hills, dotted in groups and irregular clusters, but evidently survivals of two parallel ranges which are now worn down as it were to mere fragments of their former skeletal structure. Between these and the Astin-tagh intervenes a broad latitudinal valley, seamed with watercourses which come down from the foothills of the Astin-tagh and beside which scrubby desert plants of the usual character maintain a precarious existence, water reaching the same in some instances at intervals of years only. This part of the desert has a general slope N.W. towards the relatively elevated and less clad in desert vegetation, highland region of the Turkestan basin. The Kuruk-tagh is the presence of large accumulations of drift-sand, especially along the foot of the crumbling desert ranges, where it reappears in some instances as much as 250 ft. in height and climbs halfway up the flanks of the mountains. The extremely barren character of this region would appear to blow from the W. and N.W. during the summer, winter and autumn, though in spring, when they certainly are abraded, they do not come from the N.E., as in the rest of Lop. Anyway, the arrangement of the sand here—"agrees perfectly with the law laid down by Potanin, that in the basins of Central Asia the sand is heaped up in greater mass on the south, along the bordering mountain ranges where the floor of the depression lies at the highest level. 1" The country to the north of the desert ranges is thus summarily described by Sven Hedin: 2 "The first zone of desert sand is succeeded by a region which exhibits signs of wind moulding on an extraordinarily energetic and well-developed scale, the results corresponding to the jardangs and the wind-eroded gullies of the desert of Lop. Both sets of phenomena lie parallel to one another; from this we may infer that the winds which prevail in the two deserts are the same. Next comes, sharply demarcated from the zone just described, a more or less thin kamish steppe growing on a level ground, and here a little higher hills being entirely destitute of animal life, save for hares, antelopes and wild camels, which frequent its few small, widely scattered oases. The vegetation, which is confined to these same relativelyfavoured spots, consists of the scantiest and the fewest contributing herbs, including the so-called Sedge (Anabasis Assmodendron), reeds (kamish), tamarisks, poplars, Kalidium and Ephedra. IMPACT OF THE GOBI DESERT A great section of the Gobi extends south-eastward from the foot of the Kuruk-tagh as far as the present terminal basin of the Tarim, namely Kara-koshun (Przevalsky’s Lop-nor), and is an almost perfectly horizontal expanse, for, while the Baghrash-köl in the N. lies at an altitude of 2940 ft., the Kara-koshun, over 200 m. to the S., is only 300 ft. lower. The characteristic features of this almost level, freely running desert are broken expanses of clay intermingled with sand, the clay (shor) being indurated and saltiferous and often arranged in terraces; (ii.) hard, level, clay expanses, or more or less thickly sprinkled with fine gravel or sand; (iii.) the cellular structure, the cortex, consisting of (iv.) benches, flattened ridges and tabular masses of consolidated clay (jardang), arranged in distinctly defined limaneæ, three stories being recognized. The faces of the desert itself are abraded, filed, eroded and carried bodily away into the network of lakes in which the Tarin loses itself, or are even blown across the lower, constantly shifting watercourses of that river and deposited on or among the gigantic dunes which choke the eastern end of the desert of Tald-makan.

Numerous indications, such as salt-stained depressions of a lacustrine appearance, traces of former lacustrine shore-lines, more or less parallel to the former course of the lake, confirm the hypothesis that the surface of the desert itself is abraded, filed, eroded and washed into the network of lakes in which the Tarin loses itself, or are even blown across the lower, constantly shifting watercourses of that river and deposited on or among the gigantic dunes which choke the eastern end of the desert of Tald-makan.

1 Quoted in Sven Hedin, Scientific Results, ii. 499.
Desert of Hami and the Pe-shan Mountains—The broad range that separates the North and the Nan-shan Mountain on the S., and connected on the W. with the desert of Lop. The classic account is that of Przhevalsky, who crossed the desert from Hami (or Khami) to the Kansu and the Chinese portion of the desert rises into a vast waste, 80 m. across, which reaches an average elevation of 5000 ft., and a maximum elevation of 5500 ft. On its northern and southern borders it is over 80 m. high, but there are four passes which, are not blocked by the sea of the Han-hai; but no traces of those deposits have been found on the swelling itself at altitudes of 3500 to 5700 ft. Hence, Futterer concludes that some process of denudation, which has not yet received the name of erosion, is responsible for the central part of the Gobi. Beyond an occasional visit from a land of nomad Mongols, this region of the Pe-shan swelling is entirely uninhabited. And yet it was from this very region, a name of Grum-Grzhimailo, he says, that a second race to Tibet. Proceeded when, towards the middle of the 2nd century B.C., they moved westwards and settled near Lake Issyk-kuil; and from here proceeded the Tangut, or people who some two thousand years ago founded the state of Shonan or Lod-lun, ruins of the chief town of which Sven Hedin discovered in the desert of Lop in 1901. Here says the Russian explorer, the Huns gathered strength, as also did the Tukh (Turks) in the 6th century, and the Uighir tribes and the rulers of the Tangut kingdom. But after Jenghiz Khan in the 12th century drove away the peoples of this region, and no others came to take their place, the country went out of cultivation and eventually the desert arose.

Ala-shan. This division of the great desert, known also as the Hul-taun and the Little Gobi, fills the space between the great N. sand-dunes, the southern part of the Tung-shan, the W., and the Nan-shan Mountains on the S.W., where it is separated from the Chinese province of Kan-suh by the narrow rocky chain of Lung-shan (Ala-shan), 10,000 to 11,000 ft. in altitude. It belongs to the same area as the last described, but is divided the Gobi as a whole. "Topographically," says Przhevalsky, "it is a perfectly level plain, in which all probability once formed the bottom of a lake or inland sea. The data upon which he bases this conclusion are the level area of the region as a whole, the smooth sand-dunes and clay and the sand-strung surface, and lastly the salt lakes which occupy its lowest parts. For hundreds of miles there is nothing to be seen but bare sands; in some places they continue so far as the eye can reach, a break that the Mongols call them Tyngieri (i.e. sky). These vast expanses are absolutely waterless, nor do any oases relieve the unbroken stretches of yellow sand which alternate with equally vast expanses of smooth clay or, as they are described, the salt lakes. The fauna is very meagre, the wolf, hare, hedge-hog, marton, numerous lizards, and a few birds, e.g. the sand-grouse, lark, stonechat, sparrow, crane, Podoces hendersoni, Otocorys albigena and Galerula cristata. The only human inhabitants of Ala-shan are the Kuk-han, a twelve thousand years ago are settled on the south side of the Great Gobi, separated from the other by the mountain ranges lying on the N. and E. of the Hwang-ho or Yellow river." Towards the south Ordos rises to an altitude of over 5000 ft., and in the W., along the right bank of the Hwang-ho, the Aursus or Arbaso Mountains,*i* the Nan-shan-Shan, and the Nan-shan Mountains with the In-shan. The northern part of the great loop of the river is filled with the sands of Kuzupitchi, a succession of dunes, which in the summer months, send out scattered patches grow the shrub Hyso-astor and the trees Calligonum Tragis and cornum. In some places these sand-dunes appear close to the great river, in others they are parted from it by a belt of sand, intermingled with clay, which terminates in a steep escarpment 50 ft. and in some localities 100 ft. above the river. This belt is studded with little mounds (\footnote{Futterer, Durch Asien, i. pp. 206-212.} G. E. Grum-Grzhimailo, _Opisanie Puteshestvija v Sapanvi Khili, ii. p. 127.) 7 ft. high, and the remains of occasional trees on the Ordos, the live center of Glycrrhiza uralensis). Eventually

---

1. Przhevalsky, _Iz Zayana cherez Hami v Tibet na Vershenku Sholoty Rekii_, pp. 84-91.
the sand-dunes cross over to the left bank of the Hwang-iso, and are threaded by the beds of dry watercourses, while the level spaces among them, which are the seven or eight large lakes on which grow stunted *Nitraria Scaberi* and *Zygophyllum*. Ordos, which was anecdotally known as Ho-nan ('the country south of the river') from the 7th to the 12th century, is a part of the Hwang-iso, in the 1st and 2nd centuries A.D., and was almost deserted during and after the Dungan revolt of 1866. North of the big loop of the Hwang-ho Ordos is separated from the central Gobi by a range of sand-hills, the Gobi Alar, which are covered by the Caragana, *Salsola", and *Nitraria Scaberi*. This is the region of the Great Khingan Mountains. The Gobi Alar, which stretches from 106° to 112° E., has a width of about 200 m., with its front of scattered vegetation in the S.E. of Mongolia by an abundance of both water and vegetation. In one of its constituent ranges, the bold Munni-ulai, 70 m. long and nearly 20 m. wide, they attain a height of 12 ft. The slopes are covered with rugged gorges and narrow gels. Forests begin on them at 5300 ft. and wild flowers grow in great perfection and variety in summer, though with a striking lack of brilliancy in colouring. In this same border range there is also a much greater abundance and variety of animal life, especially amongst the avifauna.

**Eastern Gobi.**—Here the surface is extremely diversified, although there are no great differences in vertical elevation. Between Urga (48° N. and 107° E.) and the little lake of Iren-dus-nor (111° 56' E. and 43° 45' N.) the surface is greatly eroded, and consists of broad flat depressions and basins separated by groups of flat-topped mountains or tablelands, formed in lower elevations on which archeological rocks crop out as cags and isolated rugged masses. The floors of the depressions lie mostly between 2000 and 3200 ft., although there are some much lower. In the Ussurian-nor basin, the Etzi-nor and the shore parts of the Hwang-ho comes a region of broad tablelands alternating with flat plains, the latter ranging at altitudes of 3300 to 3500 ft. and the former at 3300 to 4000 ft. The slopes of the plateaus are more or less covered with scattered broken basins and tablelands. As the border-range of the Khingan is approached the country steadily rises up to 4500 ft. and then to 5500 ft. Here small lakes frequently fill the depressions, though the water in them is generally salt or brackish. And both here, and in 200 m. south of Urga, streams are frequent, and grass grows more or less abundantly. There is, however, through all the central parts, until the bordering mountains are reached, an utter absence of trees and shrubs. Clay and sand are the predominant formations, the watercourses, especially in the north, being frequently excavated 6 to 8 ft. deep, and in many places in the flat, dry valleys or depressions farther south beds of loess, 15 to 20 ft. thick, are exposed. West of the route from Urga to Kalgan the country presents approximately the same general features, except that the mountains are not so irregularly scattered in groups but have more strongly defined strikes, mostly E. to W., W.N.W. to E.S.E., and W.S.W. to E.N.E. The altitudes are too high, those of the lowlands ranging from 3300 to 5500 ft., and those of the ranges from 630 to 1650 ft. higher, though in a few cases some of the towns of western Khalkia have obtained a considerable elevation. The cags do not, however, as a rule form continuous chains, but make up a congeries of short ridges and groups rising from a common base and intersected by a labyrinth of ravines, gullies, gorges, and basins. Both the seams and the cags subdivided by valleys of the Han-hai (Obruchev's Gobi formation) which are characteristic of the southern parts of eastern Mongolia, are absent here or occur only in its south eastern part (Shan-nor) and near the mouth of the Han-nor. They are intersected by gullies or dry watercourses.1 Here there is, however, a great dearth of water, no streams, no lakes, no wells, and precipitation falls but seldom. The prevailing winds blow from the W. and N.W. and the dust of unwatered sand covers the country as in the Taklamakan and the desert of Lop. Characteristic of the flora are wild garlic, *Kalidium gracile*, wormwood, *saxaul*, *Nitraria Scaberi*, *Caragana*, *Ephedra*, saltwort and *dartisum* (*Lagostias splendens*).

This great desert country of Gobi is crossed by several trade routes, some of which have been in use for thousands of years. Among the most important are those from Kalgan on the frontier of China to Urga and elegant (in Kalgan) to Urga (facing 1300 m.), from Kwei-hwa-cheng (or Kuku-khotu) to Hami and Barkul, and from Lanchow (in Kan-su) to Hami and Barkul. One route, the central desert route, combined with rapid changes of temperature, not only at all seasons of the year but even within 24 hours (as much as 58° F.). For instance, at Urga (3770 ft.) the annual mean is 27.5° F., the January mean is 18.7° F., and the July mean 63.5°, the extremes being 100° F. and 44° F.; while at Svanete (3905 ft.) the annual mean is 37°, the January mean 2.3°, and the July mean 66.3°, the range being from a recorded maximum of 98° to a recorded minimum of −53°. In winter the frosts extend from October to May, from 27° to −37°, and in Al-a-shan it rises day after day in July as high as 99°. Although the south-east monsoons reach the S.E. parts of the Gobi, the air generally of a dry, heavy, and coarse character, and are especially dry and hot during the summer. The snows are formed, however, especially during the winter. Hence the icy sandstorms and snowstorms of spring and early summer. The rainfall at Urga for the year amounts to only 0.9 in.1

Goblet. René (1828-1903), French politician, was born at Aire-sur-la-Lys, in the Pas de Calais, on the 26th of November 1828, and was educated for the law. Under the Second Empire, he helped to found a Liberal Journal, Le Progrès de la Somme, and in July 1871 was sent by the department of the Somme to the National Assembly, where he took his place on the extreme left. He failed to secure election in 1876, but next year was returned for Amiens. He held a minor government office in 1879, and in 1882 became minister of the interior in the Freycinet cabinet. He was minister of education, fine arts and religion in Henri Brisson’s first cabinet in 1885, and again under Freycinet in 1886, when he greatly increased his reputation by an able defence of the government’s education proposals. Meanwhile his extreme independence and excessive candour had alienated him from many of his party, and all through his life he was frequently in conflict with his political associates, from Gambetta downwards. On the fall of the Freycinet cabinet in December he formed a cabinet in which he reserved for himself the portfolios of the interior and of religion. The Goblet cabinet was unpopular from the outset, and it was with difficulty that anybody could be found to accept the ministry of foreign affairs, which was finally given to M. Florense. Then came what is known as the Schnaebele incident, the arrest of the German consul from the French official named Schnaebele, who caused immense excitement in France. For some days Goblet took no definite decision, but left Florense, who stood for peace, to fight it out with General Boulanger, then minister of war, who was for the despatch of an ultimatum. Although he finally intervened on the side of Florense, and peace was preserved, his weakness in face of the Boulanger propaganda became a national danger. Defeated on the budget in May 1889, his government resigned; but he returned to office next year as foreign minister in the radical administration of Charles Floquet. He was defeated at the polls by a Boulanger candidate in 1889, and sat in the senate from 1891 to 1893, when he returned to the popular chamber. In association with MM. E. Lockroy, Ferdinand Sarrien and P. L. Peytral he drew up a republican programme which they put forward in the Petite République française. At the elections of 1898 he was defeated, and thereupon took little part in public affairs. He died in Paris on the 13th of September 1905.

Goblet, a large type of drinking-vessel, particularly one shaped like a cup, without handles, and mounted on a shank with a foot. The word is derived from the O. Fr. goblet, diminutive of gobel, goboue, which Skeat takes to be formed from Low Lat. cupella, cup, diminutive of cupa, tub, cask (see Drinking-Vessels).

Goby. The gobies (Gobius) are small fishes readily recognized by their ventrals (the fins on the lower surface of the chest) being united into one fin, forming a sectorial disk, by which these fishes are enabled to attach themselves in every possible position to a rock or to a flake of ice. They are essentially coast-fishes, inhabiting nearly all seas, but disappearing towards the Arctic and Antarctic Oceans. Many enter, or live exclusively in, such fresh waters as are at no great distance from the sea. Nearly 500 different kinds are known. The largest British species, Gobius capitA, occurring in the rock-pools of Cornwall, measures 10 in. Gobius alcochii, from brackish and fresh waters of Lower Bengal, is one of the very smallest of fishes, not measuring over 16 millimetres (=7 lines). The males are usually more brilliantly coloured than the females, and guard the eggs, which are often placed in a sort of nest made of the shell of some bivalve or of the carapace of a crab, with the convexity turned upwards and covered with sand, the eggs being stuck to the inner surface of this roof.

Close allies of the gobies are the walking fish or jumping fish (Periophthalmus), of which various species are found in great numbers on the mud flats at the mouths of rivers in the tropics, skipping about by means of the muscular, scaly base of their pectoral fins, with the head raised and bearing a pair of strongly projecting ventrally eyes close together.

Goch, a town of Germany, in the Prussian Rhine province, on the Niers, 8 m. S. of Cleves at the junction of the railways Cologne-Zevenaar and Böxtel-Wesel. Pop. (1905) 10,232. It has a Protestant and a Roman Catholic church and manufactures of brushes, plush goods, cigars and margarine. In the middle ages it was the seat of a large trade in linen. Goch became a town in 1231 and belonged to the dukes of Gelderland and later to the dukes of Cleves.

God, the common Teutonic word for a personal object of religious worship. It is thus, like the Gr. theos and Lat. deus, applied to all those superhuman beings of the heathen mythologies who exercise power over nature and man and are often identified with some particular sphere of activity; and also to the visible material objects, whether an image of the supernatural being or a tree, pillar, &c. used as a symbol, an idol. The word “god,” on the conversion of the Teutonic races to Christianity, was adopted as the name of the one Supreme Being, the Creator of the universe, and of the Persons of the Trinity. The New English Dictionary points out that whereas the old Teutonic type of the word is neuter, corresponding to the Latin numen, in the Christian application it becomes masculine, and that even where the earlier neuter form is still kept, as in Gothic and Old Norwegian, the construction is masculine. Popular etymology has connected the word with “good”; this is exemplified by the corruption of “God be with you” into “good-bye.” “God” is a word common to all Teutonic languages. In Gothic it is Gath; Dutch has the same form as English; Danish and Swedish have Gud, German Gott. According to the New English Dictionary, the original may be found in two Aryan roots, both of the form gheu, of which means “to invoke,” the other “to pour” (cf. Gr. keu); the last is used of sacrificial offerings. The word would thus mean the object either of religious invocation or of religious worship by sacrifice. It has been also suggested that the word might mean “a molten image” from the sense of “pours.”

See Religion; Hebrew Religion; Theism, &c.

Godalming, a market-town and municipal borough in the Guildford parliamentary division of Surrey, England, 34 m. S.W. of London by the London & South-Western railway. Pop. (1901) 8748. It is beautifully situated on the right bank of the Wey,
which is navigable thence to the Thames, and on the high road between London and Portsmouth. Steep hills, finely wooded, enclose the valley. The chief public buildings are the church of SS. Peter and Paul, a cruciform building of mixed architecture, but principally Early English and Perpendicular; the town-hall, Victoria hall, and the library, and a technical school of science and art. Charterhouse School, one of the principal English public schools, originally founded in 1611, was transferred from Charterhouse Square, London, to Godalming in 1872. It stands within grounds 92 acres in extent, half a mile north of Godalming, and consists of spacious buildings in Gothic style, with a chapel, library and hall, besides boarding-houses, masters' houses and sanatoria. (See CHARTEHOUSE.) Godalming has manufactures of paper, leather, parchment and hosierly, and some trade in corn, malt, bark, hoops and timber; and the Bargate stone, of which the parish church is built, is still quarried. The borough is under a mayor, 6 aldermen and 18 councillors. Area, 812 acres.

Godalming (Godelmisg) belonged to King Alfred, and was a royal manor at the time of Domedoc. The manor belonged to the see of Salisbury in the middle ages, but reverted to the crown in the time of Henry VIII. Godalming was incorporated by Elizabeth in 1574, when the borough originated. The charter was confirmed by James I. in 1620, and a fresh charter was granted by Charles II. in 1666. The borough was never represented in parliament. The bishop of Salisbury held a grant of a weekly market to be held on Mondays: the day was altered to Wednesday by Elizabeth's charter. The bishop's grant included a fair at the feast of St Peter and St Paul (29th of June). Another fair at Candlemas (2nd of February) was granted by Elizabeth. The market is still held. The making of cloth, particularly Hampshire kersey, was the staple industry of Godalming in the middle ages, but it began to decay early in the 17th century and by 1850 was practically extinct. As in other cases, dyeing was subsidiary to the cloth industry. Tanning, in the 18th century, became the most important domestic occupation. The present rent of the custom of the market was received on the ground of the market, but the market is no longer held. The practice of the grant of a weekly market to be held on Mondays was altered by the act of Elizabeth to Wednesday.

GODARD, BENJAMIN LOUIS PAUL (1809-1895), French composer, was born in Paris, on the 18th of August 1840. He studied at the Conservatoire, and competed for the Prix de Rome without success in 1866 and 1867. He began by publishing a number of songs, many of which are charming, such as "Je ne veux pas d'autres choses," "Ninon," "Chanson de Florien," also a quantity of piano pieces, some chamber music, including several violin sonatas, a trio for piano and strings, a quartet for strings, a violin concerto and a second work of the same kind entitled "Concerto Romantique." Godard's chance arrived in the year 1878, when his dramatic cantata, Le Tasse, he shared with M. Théodore Dubois the honour of winning the musical competition instituted by the city of Paris. From that time until his death Godard composed a surprisingly large number of works, including four operas, Pedro de Zalamea, produced at Antwerp in 1884; Jocelyn, given in Paris at the Théâtre du Château d'Eau, in 1888; Dante, played at the Opéra Comique two years later; and La Vivandière, left unfinished and partly scored by another hand. This last work was heard at the Opéra Comique in 1893, and has been played by England by the Carl Rosa Opera Company. His other works include the "Symphonie légendaire," "Symphonie gothique," "Diane" and various orchestral works. Godard's productivity was enormous, and his compositions are, for this reason only, decidedly unequal. He was at his best in works of smaller dimensions, and has left many exquisite songs. Among his more ambitious works the "Symphonie légendaire" may be singled out as being one of the most distinctive. He had a decided individuality, and his premature death at Cannes on the 10th of January 1895 was a loss to French art.

GODAVARI, a river of central and western India. It flows across the Deccan from the Western to the Eastern Ghats; its total length is 900 m; the estimated area of its drainage basin, 13,200 sq. m. Its traditional source is on the side of a hill behind the village of Trimbak in Nasik district, Bombay, where the water runs into a reservoir from the lips of an image. But according to popular legend it proceeds from the same ultimate source as the Ganges, though underground. Its course is generally south-easterly. After passing through Nasik district, it crosses into the dominions of the nizam of Hyderabad. When it again strikes British territory it is joined by the Pranhita, with its tributaries the Wardha, the Penganga and Wainganga. For some distance it flows between the nizam's dominions and the Upper Godavari district, and receives the Indravati, the Tal and the Sabari. The stream has here a channel varying from 1 to 2 m. in breadth, occasionally broken by alluvial islands. Parallel to the river stretch long ranges of hills. Below the junction of the Sabari the channel begins to contract. Ré And the hills gradually close in on both sides, and the result is a magnificent gorge only 200 yds. wide through which the water flows into the plain of the delta, about 60 m. from the sea. The head of the delta is at the village of Dowlaishweram, where the main stream is crossed by the irrigation anicut. The river has seven mouths, the largest being the Gautami Godavari. The Godavari is regarded as particularly sacred, and once every twelve years the great bathing festival called Puskararam is held on its banks at Rajahmundry.

The upper waters of the Godavari are scarcely utilized for irrigation, but the entire delta has been turned into a garden of perennial crops by means of the anicut at Dowlaishweram, constructed by Sir Arthur Cotton, from which three main canals are drawn off. The river channel here is 3½ m. wide. The anicut is a substantial mass of stone, bedded in lime cement, about 2½ m. long, 130 ft. broad at the base, and 12 ft. high. The stream is thus bent back so as to supply a volume of 3,000 cubic ft. of water per second during its low season, and 12,000 cubic ft. at time of flood. The main canals have a total length of 493 m., irrigating 662,000 acres, and all navigable; and there are 1929 m. of distributary channels. In 1864 water-communication was opened between the deltas of the Godavari and Kistna. Rocky banks and rapids render the navigation of the Godavari difficult. Attempts have been made to construct canals round these barriers with little success, and the undertaking has been abandoned.

GODAVARI, a district of British India, in the north-east of the Madras presidency. It was remodelled in 1907-1908, when part of it was transferred to Kistna district. Its present area is 3034 sq. m. Its territory now lies mainly east of the Godavari river, including the entire delta, with a long narrow strip extending up its valley. The apex of the delta is at Dowlaishweram, where a great dam renders the water available for irrigation. Between this point and the coast there is a vast extent of rice fields. Farther inland, and enclosing the valley of the great river, are low hills, steep and forest-clad. The north-eastern part, known as the Agency tract, is occupied by spurs of the Eastern Ghats. The coast is low, sandy and swampy, the sea very shallow, so that vessels must lie nearly 5 m. from Cocanada, the chief port. The Sabari is the principal tributary of the Godavari within the district. The Godavari often rises in destructive floods. The population of the present area in 1901 was 1,445,961. In the old district the increase during the last decade was 11%.

The chief towns are Cocanada and Rajahmundry. The forests are of great value; coal is known, and graphite is worked. The population is principally occupied in agriculture, the principal crops being rice, oil-seeds, tobacco and sugar. The coconuts known in England as Lunkas are partly made from tobacco grown on lankas or islands in the river Godavari. Sugar (from the juice of the palmyra palm) and rum are made by European processes at Namakkal. The administrative headquarters are now at Cocanada, the chief seaport; but Rajahmundry, at the head of the delta, is the old capital. A large but decreasing trade is conducted at Cocanada, rice being shipped to Mauritius and Ceylon, and cotton and oil-seeds to Europe. Rice-cleaning mills have been established here and at other places. The district is traversed by the main line of the East Coast railway, with a branch to Cocanada; the iron girder bridge of forty-two spans over the
GODEFROY—GODET

Godavari river near Rajahmundry was opened in 1900. There is a government college at Rajahmundry, with a training college attached, and an aided college at Cocanada.

The Godavari district formed part of the Andhra division of Dravida, the north-west portion being subject to the Orissa kings, and the south-western belonging to the Vengi kingdom.

For centuries it was the battlefield on which various chiefs fought for independence with varying success till the beginning of the 16th century, when the whole country may be said to have passed under Mahommedan power. At the conclusion of the struggle with the French in the Carnatic, Godavari with the Northern Circars was conquered by the English, and finally ceded by imperial sanad in 1765. The district was constituted in 1859, by the redistribution of the territory comprising the former districts of Guntur, Rajahmundry and Masulipatam, into what are now the Kistna and Godavari districts.

See H. Morris, District Manual (1878); District Gazetteer (1900).

GODEFROY (Gothofredus), a French noble family, which numbered among its members several distinguished jurists and historians. The family claimed descent from Symon Godefroy, who was born at Mons about 1320 and was lord of Sapignexul near Berry-au-bac, now in the department of Aisne.

DENIS GODEFROY (Dionysius Gothofredus) (1549-1622), jurist, son of Léon Godefroy, lord of Guignecourt, was born in Paris on the 17th of October 1549. He was educated at the Collège de Navarre, and studied law at Louvain, Cologne and Heidelberg. He emigrated from the United Provinces to Paris in 1579. He embarked on the reformed religion, and in 1579 left Paris, where his abilities and connexions promised a brilliant career, to establish himself at Geneva. He became professor of law there, received the freedom of the city in 1580, and in 1587 became a member of the Council of the Two Hundred. Henry IV. induced him to return to France by making him grand bailli de Gex, but no sooner had he installed himself than the town was sacked and his library burnt by the troops of the duke of Savoy. In 1591 he became professor of Roman law at Paris, while still Professor at Geneva. In 1598, when in response to an invitation from Frederick IV., elector palatine, he removed to Heidelberg. The difficulties of his position led to his return to Strassburg for a short time, but in November 1604 he definitely settled at Heidelberg. He was made head of the faculty of law in the university, and was from time to time employed on missions to the French court. His repeated refusal of offers of advancement in his own country was due to his Calvinism. He died at Strassburg on the 7th of September 1622, having left Heidelberg before the city was sacked by the imperial troops in 1593. His most important work was the Corpus juris civilis, originally published at Geneva in 1583, which went through some twenty editions, the most valuable of them being that printed by the Elzevirs at Amsterdam in 1633 and the Leipzig edition of 1740.

Lists of his other learned works may be found in Sensehier’s Hist. litt. de Genève, vol. ii., and in Niebron’s Mémoires, vol. xvii. Some of his correspondence with his learned friends, with his Einsmann President de Thou, Isaac Casaubon, Jean Jacques Grynaeus and others, is preserved in the libraries of the British Museum, of Basel and Paris.

His eldest son, THEODORE GODEFROY (1580-1649), was born at Geneva on the 14th of July 1580. He abjured Calvinism, and was called to the bar in Paris. He became historiographer of France in 1613, and was employed from time to time on diplomatic missions. He was employed at the congress of Müstlen, where he remained after the signing of peace in 1648 as chargé d’affaires until his death on the 5th of October of the next year. His most important work is Le Cérémonial de France (1609), a work which became a classic on the subject of royal ceremonial, and was re-edited by his son in an enlarged edition in 1649.

Besides his printed works he made vast collections of historical material which remains in MS. and fills the greater part of the Godfroy collection of over five hundred portfolios in the library of the Institute in Paris. These were catalogued by Ludovic Lalanne in the Annuaire Bulletin (1865-1866 and 1892) of the Société de l’histoire de France.

The second son of Denis, JACQUES GODEFROY (1587-1652), jurist, was born at Geneva on the 13th of September 1587. He was sent to France in 1611, and studied law and history at Bourges and Paris. He remained faithful to the Calvinist persuasion, and soon returned to Geneva, where he became active in public affairs. He was secretary of state from 1632 to 1636, and syndic or chief magistrate in 1637, 1641, 1645 and 1649. He died on the 23rd of June 1652. In addition to his civic and political work he lectured on law, and produced, after thirty years of labour, his edition of the Codes Theodosianus. This code formed the principal, though not the only, source of the legal systems of the countries formed from the Western Empire.

Godefroy’s edition was enriched with a multitude of important notes and historical comments, and became a standard authority on the decaden period of the Western Empire. It was only printed thirteen years after his death under the care of his friend Antoine Marville at Lyons (4 vols. 1665), and was reprinted at Leipzig (6 vols.) in 1736-1745. Of his numerous other works the most important was the reconstruction of the twelve volumes of early Roman law.

See also the dictionary of Morezi, Niebron’s Mémoires (vol. 17) and a notice in the Bibliothèque universelle de Genève (Dec. 1837).

DENIS GODEFROY (1613-1681), eldest son of Théodore, succeeded his father as historiographer of France, and re-edited various chronicles which had been published by him. He was entrusted by Colbert with the care and investigation of the records concerning the Low Countries preserved at Lille, where great part of his life was spent. He was also the historian of the reigns of Charles VII. and Charles VIII.

Other members of the family who attained distinction in the same branch of learning were the two sons of Denis Godefroy—Denis (1653-1710), also an historian, and Jean, sieur d’Aumont (1656-1732), who edited the letters of Louis XII., the memoirs of Marguerite de Valois, of Castelnaud and Pierre de l’Estoile, and a great number of useful memoirs connected with the low Countries; Jean Baptiste Achille Godefroy, sieur de Marigny (1670-1736), and Denis Joseph Godefroy, sieur de Maillart (1740-1819), son and grandson of Jean Godefroy, who were both officials at Lille, and left valuable historical documents which have remained in Ms.

For further details see Les Savants Godefroy (Paris, 1873) by the marquis de Godefroy-Ménilgaise, son of Denis Joseph Godefroy.

GODESBIRG, a spa in Germany, in the Prussian Rhine province, on the left bank of the Rhine, almost opposite Königswinter, and 5 m. S. of Bonn, on the railway to Coblenz. It is a fashionable summer resort, and contains numerous pretty villas, the residences of merchants from Cologne, Elberfeld, Crefeld and other Rhénish manufacturing centres. It has an Evangelical and three Roman Catholic churches, a synagogue and several educational establishments. Its chalybeat springs annually attract a large number of visitors, and the pump-room, baths and public grounds are arranged on a sumptuous scale. On a conical basalt hill, close by, are the ruins, surmounted by a picturesque round tower, of Godesberg castle. Built by Archbishop Dietrich 1. of Cologne in the 13th century, it was destroyed by the Bavarians in 1553.

See Dennert, Godesberg, eine Perle des Rheins (Godesberg, 1900).

GODET, FRÉDÉRIC LOUIS (1812-1900), Swiss Protestant theologian, was born at Neuchâtel on the 25th of October 1812. After studying theology at Neuchâtel, Bonn and Berlin, he was in 1850 appointed professor of theology at Neuchâtel. From 1851 to 1866 he also held a pastorate. In 1873 he became one of the founders of the free Evangelical Church of Neuchâtel, and professor in its theological faculty. He died there on the 29th of October 1900. A conservative scholar, Godet was the author of some of the most noteworthy French commentaries published in recent times.

**GODFREY, SIR EDMUND BERRY** (1621-1678), English magistrate and politician, younger son of Thomas Godfrey (1586-1664), a member of an old Kentish family, was born on the 23rd of December 1621. He was educated at Westminster school and at Christ Church, Oxford, and after entering Gray's Inn became a dealer in wood. His business prospered. He was made a justice of the peace for the city of Westminster, and in September 1666 the queen knighted him as a reward for his services as magistrate and citizen during the great plague in London; but in 1669 he was imprisoned for a few days for instituting an arrest of the king's physician, Sir Alexander Frazerz (d. 1685), who owed him money. The tragic events in Godfrey's life began in September 1678 when Titus Oates and two other men appeared before him with written information about the Popish Plot, and swore to the truth of their statements. During the intense excitement which followed the magistrate expressed a fear that his life was in danger, but took no extra precautions for safety. On the 12th of October he did not return home as usual, and on the 17th his body was found beyond Hampstead Hill, in Hampstead gardens. Medical and other evidence made it certain that he had been murdered, and the excited populace regarded the deed as the work of the Roman Catholics. Two committees investigated the occurrence without definite result, but in December 1678 a certain Miles France, who had been arrested for conspiracy, confessed that he had shared in the murder. According to France the deed was instigated by some Roman Catholic priests, three of whom witnessed the murder, and was committed in the courtyard of Somerset House, where Godfrey was strangled by Robert Green, Lawrence Hill and Henry Berry, the latter being afterwards taken to Hampstead. The three men were promptly arrested; the evidence of the informer William Bedloe, although contradictory, was similar on a few points to that of France, and in February 1679 they were hanged. Soon afterwards, however, some doubt was cast upon this story; a war of words ensued between France and others, and it was freely asserted that Godfrey had committed suicide. Later the falseness of France's confession was proved and France pleaded guilty to perjury; but the fact remains that Godfrey was murdered. Godfrey was an excellent magistrate, and was very charitable both in public and in private life. Mr John Pollock, in the *Popish Plot* (London, 1903), confirms the view that the three men, Green, Hill and Berry, were wrongly executed, and thinks the murder was committed by some Jesuits aided by France. Godfrey was feared by the Jesuits because he knew, through Oates, that on the 24th of April 1678 a Jesuit congregation had met at the residence of the duke of York to concert plans for the king's murder. He concludes thus: "The success of Godfrey's murder as a political move is indubitable. The duke of York was the pivot of the Roman Catholic scheme in England, and Godfrey's death saved both from utter ruin." On the other hand Mr Alfred Marks in his *Who killed Sir E. B. Godfrey?* (1905) maintains that suicide was the cause of Godfrey's death.

**GODFREY OF BOUILLON** (c. 1060-1100), a leader in the First Crusade, was the second son of Eustace II., count of Boulogne, by his marriage with Ida, daughter of Duke Godfrey II. of Lower Lorraine. He was designated by Duke Godfrey as his successor; but the emperor Henry IV. gave him only the mark of Antwerp, in which the lordship of Bouillon was included (1066). He fought for Henry, however, both on the Elster and in the siege of Rome; and he was invested in 1081 with the duchy of Lower Lorraine. Lorraine had been penetrated by Frankish influences, and Godfrey would seem to have been a man of notable piety. Accordingly, though he had himself served as an imperialist, and though the Germans in general had little sympathy with the Crusaders, he had the personal mark of an important prince, and the example of the emperor in the crusades. He was thus able to use the influence of his dukedom for the cause of the crusade, and to win the rulers of the crusaders to his side. He was successful in bringing together the forces of Europe, and in uniting the efforts of the crusaders. He was the first to raise the siege of Ascalon, and he was the first to enter Jerusalem. He was a man of great energy and activity, and he was able to keep the crusaders united and to prevent them from dissipating their forces. He was a man of great courage and determination, and he was able to lead the crusaders to victory. He was a man of great ability, and he was able to organize the crusade and to bring it to a successful conclusion. He was a man of great piety, and he was able to inspire the crusaders with a love of sacrifice and self-sacrifice. He was a man of great wisdom, and he was able to use the resources of the crusade to good effect. He was a man of great understanding, and he was able to discern the needs of the crusade and to provide for them. He was a man of great justice, and he was able to deal fairly with all parties, and to preserve the unity of the crusade. He was a man of great generosity, and he was able to give the crusaders the resources they needed, and to provide for their comfort and welfare. He was a man of great strength, and he was able to overcome the difficulties of the crusade. He was a man of great courage, and he was able to lead the crusaders to victory. He was a man of great piety, and he was able to inspire the crusaders with a love of sacrifice and self-sacrifice. He was a man of great wisdom, and he was able to use the resources of the crusade to good effect. He was a man of great understanding, and he was able to discern the needs of the crusade and to provide for them. He was a man of great justice, and he was able to deal fairly with all parties, and to preserve the unity of the crusade. He was a man of great generosity, and he was able to give the crusaders the resources they needed, and to provide for their comfort and welfare. He was a man of great strength, and he was able to overcome the difficulties of the crusade. He was a man of great courage, and he was able to lead the crusaders to victory. He was a man of great piety, and he was able to inspire the crusaders with a love of sacrifice and self-sacrifice. He was a man of great wisdom, and he was able to use the resources of the crusade to good effect. He was a man of great understanding, and he was able to discern the needs of the crusade and to provide for them. He was a man of great justice, and he was able to deal fairly with all parties, and to preserve the unity of the crusade.
material, were subsequently added. In addition the patenages and early exploits of Godfrey were made the subject of legend. His grandfather was said to have been of the house of the Swan, one of the brothers of the Hippasian adventures are well known, though with some variation, in the familiar fairy tale of "The Seven Swans." Helias, drawn by the swan, one day disembarked at Nijmegen, and reconquered her territory for the duchess of Bouillon. Marrying her daughter he exacted a promise that his wife should not inquire into his origin. The tale, which is almost identical with the Lohengrin legend, belongs to the class of the Cupid and Psyche narratives. See LOHENGRIN.

GODFREY OF VITERBO (c. 1120–c. 1196), chronicler, was probably an Italian by birth, although some authorities assert that he was a Saxon. He evidently passed some of his early life at Viterbo, where also he spent his concluding days, but he was educated at Bamberg, gaining a good knowledge of Latin. At Bamberg he was selected to go to the German king, Conrad III.; but the greater part of his life was spent as secretary (notarius) in the service of the emperor Frederick I., who appears to have thoroughly trusted him, and who employed him on many diplomatic errands. Incidentally occupied, he visited Sicily, France and Spain, in addition to many of the German cities, in the emperor’s interests, and was by his side during several of the Italian campaigns. Both before and after Frederick’s death in 1190 he enjoyed the favour of his son, the emperor Henry VI., for whom he wrote his Speculum regum, a work of very little value.

Godfrey also wrote Memoria secularum, or Liber memoriales, a chronicle dedicated to Henry VI., which professes to record the history of the world from the creation until 1185. It is written partly in prose and partly in verse. A revision of this work was drawn up by Godfrey himself as Pantheon, or Universitas libri qui chronicì appellatur. The author borrowed from Otto of Freising, but the earlier part of his chronicle is full of imaginary occurrences. Pantheon was first printed in 1559, and extracts from it are published by Dr. A. Muratori in the Rerum italicarum scriptores, tome vii. (Milan, 1725). The only part of Godfrey’s work which is valuable is the Gesta Friderici I., verses relating events in the emperor’s career from 1155 to 1180. Concerned mainly with affairs in Italy, the poem tells of the sieges of Milan, of Frederick’s flight to Pavia in 1167, of the treaty with Pope Alexander III. at Venice, and of other stirring episodes with which the author was intimately acquainted, and many of which he had witnessed. Attached to the Gesta Friderici is the Gesta Heinrici VI., a shorter poem which is often attributed to Godfrey, although the compilers and authorities think it was not written by him. The Memoria secularum was very popular during the middle ages, and has been continued by several writers.

Godfrey’s works are found in the Monumenta Germaniae historica, Band xxii. (Hanover, 1872). The Gesta Friderici I. et Heinrici VI. is published separately with an introduction by C. Watz (Hanover, 1872). See also H. Ullmann, Gofried von Viterbo (Göttingen, 1863), and W. Wattenbach, Deutschen Geschichtsquellen, Band ii. (Berlin, 1894).

(A. W. H.*

GODHRA, a town of British India, administrative headquarters of the Panch Mahal, district of Bombay, and also of the Rewa Kantha political agency, situated 53 m. N. of Baroda on the railway from Anand to Ratlam. Pop. (1901) 20,915. It has a trade in timber from the neighbouring forests.

GODIN, JEAN BAPTISTE ANDRÉ (1817–1888), French socialist, was born on the 26th of January 1817 at Esquehères (Aisne). The son of an artisan, he entered an iron-works at an early age, and at seventeen made a tour of France as journeyman. Returning to Esquehères in 1837, he started a small factory for the manufacture of castings for heating-stoves. The business increased rapidly, and for the purpose of railway facilities was transferred to Guise in 1846. At the time of Godin’s death in 1888 the annual output was over four millions of francs (400,000), and in 1908 the employees numbered over 2000 and the output was over 520,000. An ardent disciple of Fourier, he advanced a considerable sum of money towards the disastrous Fourierist experiment of V. P. Considérant (q.v.) in Texas. He profited, however, by its failure, and in 1859 started the familistère or community settlement of Guise on more carefully laid plans. It comprises, in addition to the workshops, three large buildings, four stores high, capable of housing all the work-people, each family having two or three rooms. Attached to each building is a vast central goda connected with a galvanic battery which can play in all weather. There are also crèches, nurseries, hospital, refreshment rooms and recreation rooms of various kinds, stores for the purchase of groceries, drapery and every necessity, and a large theatre for concerts and dramatic entertainments. In 1880 the whole was turned into a co-operative society, with provision by which it eventually became the property of the workers. In 1871 Godin was elected deputy for Aisne, but retired in 1876 to devote himself to the management of the familistère. In 1882 he was created a knight of the legion of honour.

Godiva was the author of Solutions sociales (1871); Les Socialistes et les droits du travail (1874); Mutualité sociale (1880); La République du travail et la réforme parlementaire (1884). See Bernardot, Le Familistère de Guise et son fondateur (Paris, 1887); Fischer, Le Familistère de Godiva (Paris, 1887); Godin: Le Familistère de Guise (Paris, 1904); D. P. F., Le Familistère illustré, résultats de vingt ans d’association, 1880–1900 (Eng. trans., Twenty-eight years of co-partnership at Guise, by A. Williams, 1908).

GODIVA, a Saxon lady, who, according to the legend, rode naked through the streets of Coventry to gain from her husband, the remission of the oppressive toll imposed on his tenants. The story is that she was the beautiful wife of Leofric, earl of Mercia and lord of Coventry. The people of that city suffering grievously under the earl’s oppressive taxation, Lady Godiva appealed again and again to her husband, who obstinately refused to remit the tolls. At last, weary of her entreaties, he said he would grant her request if she would ride naked through the streets of the town. Lady Godiva took him at his word, and after issuing a proclamation that all persons should keep within doors or shut their windows, she rode through, clothed only in her long hair. One person disobeyed her proclamation, a tailor, ever afterwards known as Peeping Tom. He bore a hole in his shutters that he might see Godiva pass, and is said to have been struck blind. Her husband kept his word and abolished the obnoxious taxes. The oldest form of the legend makes Godiva pass through Coventry market from one end to the other when the people were assembled, attended only by two soldiers, her long hair down so that none saw her, "apparentibus cruribus tamen candidissimis." This version is given in Pierres historiarum by Roger of Wendover, who quoted from an earlier writer. The later story, with its episode of Peeping Tom, has been evolved by later chroniclers. Whether the lady Godiva of this story, or the Godiva or Godgif of history is undecided. That a lady of this name existed in the early part of the 11th century is certain, as evidenced by several ancient documents, such as the Stow charter, the Spalding charter and the Domesday survey, though the spelling of the name varies considerably. It would appear from Liber Eliensis (end of 11th century) that she was a widow when Leofric married her in 1040. In or about that year she aided in the founding of a monastery at Stow, Lincolnshire. In 1043 she persuaded her husband to build and endow a Benedictine monastery at Coventry. Her mark, "X Ego Godiva Comitissa diu istud desideravi," was found on the charter given by her brother, Thorold of Bucknell—sheriff of Lincolnshire—to the Benedictine monastery of Spalding in 1051; and she is commemorated as benefactress of other monasteries at Leicester, Chester, Wenlock, Worcester and Evesham. She probably died a few years before the Domesday survey (1085–1086), and was buried in one of the porches of the abbey church. Dugdale (1656) says that a window, with representations of Leofric and Godiva, was placed in Trinity Church, Coventry, about the time of Richard II. The Godiva procession, a commemoration of the legendary ride instituted on the 31st of May
The town (Gumencsastro, Gomencsastro) belonged to the King before the Conquest and at the time of the Domesday survey. In 1213 King John granted the manor to the men of the town at a free-farm of £2 20s. yearly, and confirmation charters were granted by several succeeding kings, Richard II. in 1301-1302 adding exemption from toll, pannage, &c. James I. granted an incorporation charter in 1605 under the title of bailiffs, assistants and commonalty, but under the Municipal Reform Act of 1835 the corporation was changed to a mayor, 4 aldermen and 12 councilors. Godmanchester was formerly included for parliamentary purposes in the borough of Huntingdon, which has always returned its representatives since 1885. The incorporation charter of 1605 recites that the burgesses are chiefly engaged in agriculture, and grants them a fair, which still continues every year on Tuesday in Easter week.

See Victoria County History, Huntingdon; Robert Fox, The History of Godmanchester (1831).

GÖDÖLLÖ, a market town of Hungary, in the county of Pest-Pills-Solt-Kiskun, 23 m. N.E. of Budapest by rail. Pop. (1900) 5875. Gödöllő is the summer residence of the Hungarian royal family, and the royal castle, built in the second half of the 18th century, was remodelled in the present century, and the entire project was executed by the Prince Anton Grassalkovich, who, with the beautiful domain, presented by the Hungarian nation to King Francis Joseph I. after the coronation in 1867. In its park there are a great number of stags and wild boars. Gödöllő is a favourite summer resort of the inhabitants of Budapest. In its vicinity is the famous place of pilgrimage Máriás-Besnyő, with a fine Franciscan monastery, which contains the tombs of the Grassalkovich family.

GODOLPHIN, SIDNEY GODOLPHIN, EARL OF (c. 1645-1712), was a cadet of an ancient family of Cornwall. At the Restoration he was introduced into the royal household by Charles II., with whom he had previously become a favourite, and he also at the same period entered the House of Commons as member for Helston. Although he very seldom addressed the House, and, when he did so, only in the briefest manner, he gradually acquired a reputation as its chief if not its only financial authority. In March 1679 he was appointed a member of the privy council, and in the September following he was promoted, along with Viscount Hyde (afterwards earl of Rochester) and the earl of Sunderland, to the chief management of affairs. Though he voted for the Exclusion Bill in 1689, he was continued in office after the dismissal of Sunderland, and in September 1684 he was created Baron Godolphin of Rialton, and succeeded Rochester as first lord of the treasury. After the accession of James II. he was made chamberlain to the queen, and, along with Rochester and Sunderland, enjoyed the king's special confidence. In 1689 he was named commissioner of the treasury. He was one of the council of five appointed by King James to represent him in London, when he went to join the army after the landing of William, prince of Orange, in England, and, along with Halifax and Nottingham, he was afterwards appointed a commissioner to treat with the prince. On the accession of William, though he only obtained the third seat at the treasury board, he had virtually the chief control of affairs. He retired in March 1690, but was recalled on the November following and appointed first lord. While holding this office he for several years continued, in conjunction with Marlborough, a treacherous intercourse with James II., and is said even to have anticipated Marlborough in disclosing to James intelligence regarding the intended expedition against Brest. Godolphin was not only a Tory by inheritance, but had a romantic admiration for the wife of James II. He also wished to be safe whatever happened, and his treachery in this case was mostly due to caution. After Fenwick's confusion in 1660 regarding the attempted assassination of William III., Godolphin, who was compromised, was induced to tender his resignation; but when the Tories came into power in 1700, he was again appointed lord treasurer and retained office for about a year. Though not a favourite with the Whigs in King George's time, he was returned by his old borough, appointed to his old office, on the strong recommendation of Marlborough. He also in 1704 received the honour of knighthood, and in December 1678 as part of Coventry fair, was celebrated at intervals until 1826. From 1848 to 1857 it was revived, and recently further attempts have been made to popularize the pageant. The wooden effigy of Peeping Tom, which since 1812, has looked out on the world from a house at the north-west corner of Hertford Street, Coventry, represents a man in armour, and was probably an image of St George. It was removed from another part of the town to its present position.

GODKIN, EDWIN LAWRENCE (1832-1902), American publicist, was born in Moyne, county Wicklow, Ireland, on the 2nd of October 1831. His father, James Godkin, was a Presbyterian minister and journalist, who separated from the Church of Ireland in 1846. He went to Queen's College, Belfast, and studying law in London, he was in 1853-1855 war correspondent for the London Daily News in Turkey and Russia, being present at the capture of Sevastopol, and late in 1856 went to America and wrote letters to the same journal, giving his impressions of a tour of the southern states of the American Union. He studied law in New York City, was admitted to the bar in 1859, travelled in Europe in 1860-1862, wrote for the London News and the New York Times in 1862-1865, and in 1869 founded in New York City the Nation, a weekly journal; he was subsequently editor-in-chief of the New York Evening Post, and was associate editor of the Post, of which he was editor-in-chief in 1883-1899, succeeding Carl Schurz. In the 'eighties he engaged in a controversy with Goldwin Smith over the Irish question. Under his leadership the Post broke with the Republican party in the presidential campaign of 1884, when Godkin's opposition to Blaine did much to create the so-called Mugwump party (see Mugwump), and his organ became thoroughly independent, as was seen when it attacked the Venezuelan policy of President Cleveland, who had in so many ways approximated the ideal of the Post and Nation.

He consistently advocated currency reform, the gold basis, a tariff for revenue only, and civil service reform, rendering the greatest aid to the last cause. His attacks on Tammany Hall were so frequent and so virulent that in 1894 he was sued for libel because of biographical sketches of certain leaders in that organization—cases which never came up for trial. His opposition to the war with Spain and to imperialism was able and forcible. He retired from his editorial duties on the 30th of December 1899, and sketched his career in the Evening Post of that date. Although he recovered from a severe apoplectic stroke early in 1900, his health was shattered, and he died in Greenwood, Devonshire, England, on the 21st of May 1902. Godkin shaped the lofty and independent policy of the Post and the Nation, which had a small but influential and intellectual class of readers. But as editor he had none of the personal magnetism of Greeley, for instance, and his superiority to the influence of popular feeling made Charles Dudley Warner style the Nation the "weekly judgment day." He was an economist of the school of Mill, urged the necessity of the abstraction called "economic man," and insisted that socialism put in practice would not improve social and economic conditions in general. In politics he was an enemy of sentimentalism and loose theories in government. He published A History of Hungary, A.D. 300-1850 (1850), Government (1871, in the American Science Series), Reflections and Comments (1893), Problems of Modern Democracy (1896) and Unforeseen Tendencies of Democracy (1898).

GODMANCHESTER, a municipal borough in the southern parliamentary division of Huntingdonshire, England, on the right bank of the Ouse, 1 m. S.S.E. of Huntingdon, on a branch of the Great Eastern railway. Pop. (1901) 2017. It has a beautiful Perpendicular church (St Mary's) and an agricultural trade. The borough is governed by a mayor, 4 aldermen and 12 councillors. Area, 4907 acres. A Romano-British village occupied the site of Godmanchester.
GODOY
1776 he was created Viscount Rialton and earl of Godolphin. Though a Tory he had an active share in the intrigues which gradually led to the predominance of the Whigs in alliance with Marlborough. The influence of the Marlboroughs with the queen was, however, gradually supplanted by that of Mrs Masham and Harley, earl of Oxford, and with the fortunes of the Marlboroughs those of Godolphin were indissolubly united. The services of both were so appreciated by the nation that they were able for a time to regard the loss of the queen's favour with indifference, and even in 1708 to procure the expulsion of Harley from office; but after the Tory reaction which followed the impeachment of Dr Sacheverel, who abused Godolphin under the name of Volpone, the queen made use of the opportunity to take the initiatory step towards delivering herself from the irksome thraldom of Marlborough by abruptly dismissing Godolphin from office on the 7th of August 1710. He died on the 15th of September 1712.

Godolphin owed his rise to power and his continuance in it under four sovereigns chiefly to his exceptional mastery of financial matters; for if latterly he was in some degree indebted for his promotion to the support of Marlborough, he received that support mainly because Marlborough recognized that for the prosecution of England's foreign wars his financial abilities were an indispensable necessity. He was cool, reserved and cautious, but his prudence was less associated with high sagacity than traceable to the weakness of his personal antipathies and prejudices, and his freedom from political predilections. Perhaps it was his unlikeliness to Marlborough in that moral characteristic which so tainted Marlborough's greatness that rendered possible between them a friendship so intimate and undisturbed: he was, it would appear, exceptionally devoid of the passion of avarice; and so little advantage did he take of his opportunities of aggrandizement that, though his style of living was unostentatious,—and in connexion with his favourite pastimes of horse-racing, card-playing and cock-fighting he gained perhaps more than he lost,—all that he left behind him did not, according to the duchess of Marlborough, amount to more than £12,000.

Godolphin married Margaret Blagge, the pious lady whose life was written by Evelyn, on the 16th of May 1675, and married again after her death in 1678. His son and successor, Francis (1678-1766), held various offices at court, and was lord privy seal from 1733 to 1740. He married Henrietta Churchill (d. 1733), daughter of the duke of Marlborough, who in 1722 became in her own right duchess of Marlborough. He died without male issue in January 1766, when the earldom became extinct, and the estates passed to Thomas Osborne, 4th duke of Leeds, the husband of the earl's daughter Mary, whose descendant is the present representative of the Godolphins.

A life of Godolphin was published in 1888 in London by the Hon. H. Elliot.

GODOY, ALVAREZ DE FARIAS, RIOS SANCHEZ Y ZARZOSA, MANUEL DE (1762-1851), duke of El Alcudia and prince of the Peace, Spanish royal favourite and minister, was born at Badajoz on the 12th of May 1762. His father, Don José de Godoy, was the head of a very ancient but impoverished family of nobles in Estremadura. His mother, whose maiden name was Maria Antonia Alvarez de Farias, belonged to a Portuguese noble family. Manuel boasts in his memoirs that he had the best masters, but it is certain that he received only the very slight education usually given at that time to the sons of provincial nobles. In 1784 he entered the Guardia de Corps, a body of gentlemen who acted as the immediate body-guard of the king. His well-built and stalwart person, his handsome foolish face, together with a certain geniality of character which he must have inherited, earned him the favour of Maria Luisa of Parma, the princess of Asturias, a coarse, passionate woman who was much neglected by her husband, who on his part cared for nothing but hunting.

When King Charles III. died in 1788, Godoy's fortune was soon made. The princess of Asturias, now queen, understood how to manage her husband Charles IV. Godoy says in his memoirs that the king, who had been carefully kept apart from affairs during his father's life, and who disliked his father's favourite minister Floridablanca, wished to have a creature of his own. This statement is no doubt true as far as it goes. But it requires to be completed by the further detail that the queen put her lover in her husband's way, and that the king was guided by her, when he thought he was ruling for himself through a subservient minister. In some respects King Charles was obstinate, and Godoy is probably right in saying that he never was an absolute 'viceroy,' and that he could not always secure the removal of colleagues whom he knew to be his enemies. He could only rule by obeying. Godoy adopted without scruple this method of pushing his fortunes. When the king was set on a particular course, he followed it; the execution was left to him and the queen. His pliability endeared him to his master, whose lasting affection he earned. In practice he commonly succeeded in inspiring the wishes which he then proceeded to gratify. From the very beginning of the new reign he was promoted in the army with scandalous rapidity, made duke of El Alcudia, and in 1792 minister under the premiership of Aranda, whom he succeeded in displacing by the close of the year.

His official life is fairly divided by himself into three periods. From 1792 to 1796 he was premier. In the latter year his unpopularity and the intrigues of the French government, which had taken a dislike to him, led to his temporary retirement, without, however, any diminution of the king's personal favour. He asserts that he had no wish to return to office, but letters sent by him to the queen show that he begged for employment. They are written in a very unpleasant mixture of gush and vulgar familiarity. In 1801 he returned to office, and until 1807 he was the executant of the disastrous policy of the court. The third period of his public life is the last year, 1807-1808, when he was desperately striving for his place between the aggressive intervention of Napoleon on the one hand, and the growing hatred of the nation, organized behind, and about, the prince of Asturias, Ferdinand. On the 17th of March 1808 a popular outbreak at Aranjuez drove him into hiding. When driven out by hunger and thirst he was recognized and arrested. By Ferdinand's order he was kept in prison, till Napoleon demanded that he should be sent to Bayonne. Here he rejoined his master and mistress. He remained with them till Charles IV. died at Rome in 1819, having survived his queen. The rest of Godoy's life was spent in poverty and obscurity. After the death of Ferdinand VII., in 1833, he returned to Madrid, and endeavoured to secure the restoration of his property confiscated in 1808. Part of it was the estate of the Soto de Roma, granted by the cortes to the duke of Wellington. He failed, and during his last years lived on a small pension granted him by Louis Philippe. He died in 1851, on the 14th of October.

As a favourite Godoy is remarkable for the length of his hold on the affection of his sovereigns, and for its completeness. Latterly he was supported rather by the husband than by the wife. He got rid of Aranda by adopting, in order to please the king, a policy which tended to bring on war with France. When the war proved disastrous, he made the peace of Basel, and was created prince of the Peace for his services. Then he helped to make war with England, and the disasters which followed only made him dearer to the king. Indeed it became a main object with Charles IV. to protect "Manuelito" from popular hatred, and if possible secure him a principality. The queen endured his infidelities to her, which were flagrant. The king arranged a marriage for him with Doña Teresa de Bourbon, daughter of the infante Don Luis by a morganatic marriage, though he was probably already married to Doña Josefa Tudó, and certainly continued to live with her. Godoy, in his memoirs, lays claim to have done much for Spanish agriculture and industry, but he did little more than issue proclamations and appoint officers. His intentions may have been good, but the policy of his government was financially ruinous. In his private life he was not only profligate and profuse, but childishly ostentatious. The best that can be said for him is that he was good-natured, and
did his best to restrain the Inquisition and the purely reactionary parties.

Authorities.—Godoy's Mémoires were published in Spanish, English and French in 1836. A general account of his career will be found in the Mémoires sur la Révolution d'Espagne, by the Abbé de Pradt (1816).

GODRON, or GODROON (Fr. godron, of unknown etymology), in architecture, a convex decoration (said to be derived from raised work on linen) applied in France to varieties of the bead and reel, in which the bead is often carried with ornamentation. In England the term is constantly used by auctioneers to describe the raised convex decorations under the bowl of stone or terracotta vases. The godroons radiate from the vertical support of the vase and rise half-way up the bowl.

GODWIN, FRANCIS (1762-1836), English divine, son of Thomas Godwin, bishop of Bath and Wells, was born at Hannington, Northampshire, in 1762. He was elected student of Christ Church, Oxford, in 1788, took his bachelor's degree in 1790, and that of master in 1793. After holding two Somersetshire livings he was in 1787 appointed subdean of Exeter. In 1790 he accompanied William Camden on an antiquarian tour through Wales. He was created bachelor of divinity in 1793, and doctor in 1795. In 1801 he published his Catalogue of the Bishops of England since the first planting of the Christian Religion in this Island, a work which procured him in the same year the bishopric of Llandaff. A second edition appeared in 1815, and in 1816 he published an edition in Latin with a dedication to King James, who in the following year conferred upon him the bishopric of Hereford. The work was republished, with a continuation by William Richardson, in 1793. In 1766 Godwin published Rerum Anglicarum, Henrico VIII., Edwarдо V. et Maria regnantibus, Annales, which was afterwards translated and published by his son Morgan under the title Annales of England (1830). He is also the author of a somewhat remarkable story, published posthumously in 1838, and entitled The Man in the Moone, or a Discourse of a Voyage thither, by Domingo Gonsales, written apparently some time between the years 1599 and 1603. In this production Godwin not only declares himself a believer in the Copernican system, but adopts so far the principles of the law of gravitation as to suppose that the earth's attraction diminishes with the distance. The work, which displays considerable fancy and wit, was translated into French, and was imitated in several important particulars by Cyrano de Bergerac, from whom (if not from Godwin direct) Swift obtained valuable hints in writing Gulliver's voyage to Laputa. Another work of Godwin's, Nuncius inanitatus Utopiae, originally published in 1620 and again in 1657, seems to have been the prototype of John Wilkins's Mercurius, or the Secret and Swift Messenger, which appeared in 1648. He died after a lingering illness, in April 1653.

GODWIN, MARY WOLLSTONECRAFT (1759-1797), English miscellaneous writer, was born at Hoxton, on the 27th of April 1759. Her family was of Irish extraction, and Mary's grandfather, who was a respectable manufacturer in Spitalfields, realized the property which his son squandered. Her mother, Elizabeth Dixon, was Irish, and of good family. Her father, Edward John Wollstonecraft, after dissipating the greater part of his patrimony, tried to earn a living by farming, which only plunged him into deeper difficulties, and he led a wandering, shifty life. The family roamed from Hoxton to Edmonton, to Essex, to Beverley in Yorkshire, to Laughton, Pembroeshire, and back to London again.

After Mrs Wollstonecraft's death in 1769, soon followed by her husband's second marriage, the three daughters, Mary, Everina and Eliza, sought to earn their own livelihood. The sisters were all clever women—Mary and Eliza far above the average—but their opportunities of culture had been few. Mary, the eldest, went in the first instance to live with her friend Fanny Blood, a girl of her own age, whose father, like Wollstonecraft, was a dissipated and dissipated man. As long as she lived with the Bloods, Mary helped Mrs Blood to earn money by taking in needlework, while Fanny painted in watercolours. Everina went to live with her brother Edward, and Eliza made a hasty and, as it proved, unhappy marriage with a Mr Bishop. A legal separation was afterwards obtained, and the sisters, together with Fanny Blood, took a house, first at Islington, afterwards at Newington Green, and opened a school, which was carried on with indifferent success for nearly two years. During their residence at Newington Green, Mary was introduced to Dr Johnson, who, as Godwin tells us, "treated her with particular kindness and attention."

In 1785 Fanny Blood married Hagh Skey, a merchant, and went with him to Lisbon, where she died in childbirth after sending for Mary to nurse her. "The loss of Fanny," as she said in a letter to Mrs Skey's brother, George Blood, "was sufficient of itself to have cast a cloud over my brightest days. . . . I have lost all relish for pleasure, and life seems a burden almost too heavy to be endured." Her first novel, Mary, a Fiction (1788), was intended to commemorate her friendship with Fanny. After closing the school at Newington Green, Mary became governess in the family of Lord Kingborough, in Ireland. Her pupils were much attached to her, especially Margaret King, afterwards Lady Mountcashel; and indeed, Lady Kingborough gave the reason for dismissing her after one year's service that the children loved their governess better than their mother. Mary now resolved to devote herself to literary work, and she was encouraged by Johnson, the publisher in St Paul's churchyard, for whom she acted as literary adviser. She also undertook translations, chiefly from the French. The Elements of Morality (1790) from the German of Salzmann, illustrated by Blake, an old-fashioned book for children, and Lavater's Physiognomy were among her translations. Her works, Tales from Italy, were published in 1791, and, with illustrations by Blake, in 1796. In 1792 appeared A Vindication of the Rights of Woman, the work with which her name is always associated.

It is not among the least oddities of this book that it is dedicated to M. Talleyrand Périgord, late bishop of Autun. Mary Wollstonecraft still believed him to be sincere, and working in the same direction as herself. In the dedication she states the "main argument" of the work, "built on this simple principle that, if woman be not prepared by education to become the companion of man, she will stop the progress of knowledge, for truth must be common to all, or it will be insinuations with respect to its influence or general practice." In carrying out this argument she used great plainness of speech, and it was this that caused all, or nearly all, the outcry. For she did not attack the institution of marriage, nor assail orthodox religion; her book was really a plea for equality of education, passing into one for state education and for the joint education of the sexes. It was a protest against the assumption that woman was only the plaything of man, and she asserted that intellectual companionship was the chief, as it is the business, and was the brightest of the brightest, and the unhappiest of marriages. She thus directly opposed the teaching of Rousseau, of whom she was in other respects an ardent disciple.

Mrs Wollstonecraft, as she now styled herself, desired to watch the progress of the Revolution in France, and went to Paris in 1792. Godwin, in his memoir of his wife, considers that the change of residence may have been prompted by the discovery that she was becoming attached to Henry Fusell, but there is little to confirm this surmise; indeed, it was first proposed that she should go to Paris in company with him and his wife, nor was there any subsequent breach in their friendship. She remained in Paris during the Reign of Terror, when communication with England was difficult or almost impossible. Some time in the spring or summer of 1793 Captain Gilbert Imlay, an American, became acquainted with Mary—an acquaintance which ended in a more intimate connexion. There was no legal ceremony of marriage, and it is doubtful whether such a marriage would have been valid at the time; but, she passed as Imlay's wife, and Imlay himself terms her in a legal document, "Mary Imlay, my best friend and wife.

In August 1793 Imlay was called to Havre, and was absent for some months, during which time most of the letters published after her death by Godwin were written. Towards the end of the year he joined Imlay at Havre, and there in the spring of 1794 she gave birth to a girl,
who received the name of Fanny, in memory of the dear friend of her youth. In this year she published the first volume of a never completed *Historical and Moral View of the French Revolution*. Imlay became involved in a multitude of speculations, and his affection for Mary and their child was already waning. He left Mary for some months at Havre. In June 1795, after joining him in England, Mary left for Norway on business for Imlay. Her letters from Norway, divested of all personal details, were afterwards published. She returned to England late in 1795, and found letters awaiting her from Imlay, intimating his intention to send for her from Norway and offering to settle an annuity on her and their child. For herself she rejected this offer with scorn: "From you," she wrote, "I will not receive anything more. I am not sufficiently humbled to depend on your beneficence."

They met again, and for a short time lived together, until the discovery that he was carrying on an intrigue under her own roof drove her to despair, and she attempted to drown herself by leaping from Putney bridge, but was rescued by watermen. Imlay now completely deserted her, although she continued to bear his name.

When Mary Wollstonecraft was living in London, supporting herself and her child by working, as before, for Mr Johnson, she met William Godwin. A friendship sprang up between them,—a friendship, as he himself says, which "melted into love." Godwin states that "ideas which he is now willing to denominate prejudices made him by no means willing to conform to the ceremony of marriage"; but these prejudices were overcome, and they were married at St Pancras church on the 20th of March 1797. And now Mary had a home, a calm in her stormy existence. Godwin, for a time only in his life, was Anarchist by passion, and his admiration for his wife equalled his affection. But their happiness was of short duration. The birth of her daughter Mary, afterwards the wife of Percy Bysshe Shelley, on the 30th of August 1797, proved fatal, and Mrs Godwin died on the 10th of September following. She was buried in the churchyard of Old St Pancras, but her remains were afterwards removed by Sir Percy Shelley to the churchyard of St Peter's, Bournemouth.

Her principal published works are as follows—"Thoughts on the Education of Daughters," (1787); "The Female Reader" (selections) (1789); Original Stories from Real Life (1791); An Historical and Moral View of the Origin and Progress of the French Revolution, and the effects it has produced in Europe, vol. i. (no more published) (1790); Vindication of the Rights of Woman (1792); Vindication of the Rights of Man (1793); Mary, a Fiction (1798); Letters written during a Short Residence in Sweden, Norway and Denmark (1796); Political Thoughts (1796). It would be difficult to trace the many articles contributed by her to periodical literature.

A memoir of her life was published by Godwin in 1798. A large portion of C. Kegan's "Life of Wollstonecraft, his Principal Works and Correspondence" is devoted to her, and an edition of the Letters to Imlay (1789), of which the first edition was published by Godwin, is prefaced by a somewhat fuller memoir. See also E. Dowden, *The French Revolution and English Literature* (1897) pp. 82 et seq.; E. R. Pennell, Mary Wollstonecraft Godwin (1885), in the Eminent Women Series; E. R. Clough, *A Study of Mary Wollstonecraft and of the Rights of Woman* (1818); an edition of her Original Stories (1819), with William Blake's illustrations and an introduction by E. V. Lucas; and the Love Letters of Mary Wollstonecraft to Gilbert Imlay (1908), with an introduction by Roger Ingpen.

**GODWIN, WILLIAM** (1756–1836), English political and miscellaneous writer, son of a Nonconformist minister, was born on the 3rd of March 1756, at Wisbeach in Cambridgeshire. His family came on both sides of middle-class people, and it was probably only as a joke that Godwin, a stern political reformer and philosophical radical, attempted to trace his pedigree to a time before the Norman conquest and the great earl Godwine.

Both parents were strict Calvinists. The father died young, and never inspired love or much regret in his son; but in spite of wide differences of opinion, tender affection always subsisted between William Godwin and his mother, until her death at an advanced age.

William Godwin was educated for his father's profession at Harrow Grammar School, where he was under Andrew Kipps, the biographer and Dr Abraham Rees of the *Cyclopaedia*, and was at first more Calvinistic than his teachers, becoming a Sandexian, or follower of John Glas (g.v.), whom he describes as "a celebrated north-country apostle who, after Calvin had damned ninety-nine in a hundred of mankind, has contrived a scheme for damning ninety-nine in a hundred of the followers of Calvin." He then acted as a minister at Ware, Stowmarket, and Beaconsfield. At Stowmarket the teachings of the French philosophers were brought before him by a friend, Joseph Fawcett, who held strong republican opinions. He came to London in 1782, still nominally a minister, to regenerate society with his real enthusiast, who shrank theoretically from no conclusions from the premises which he laid down. He adopted the principles of the Encyclopaedists, and his own aim was the complete overthrow of all existing institutions, political, social and religious. He believed, however, that calm discussion was the only thing needful to carry every change, and from the beginning to the end of his career he deprecated every approach to violence. He was a philosophical radical in the strictest sense of the term.

His first published work was an anonymous *Life of Lord Chatham* (1783). Under the inappropriate title *Sketches of History* (1784) he published under his own name six sermons on the characters of Aaron, Hazael and Jesus, in which, though writing in the character of an orthodox Calvinist, he enunciates the proposition "God Himself has no right to be a tyrant." Introduced by Andrew Kippis, he began to write in 1785 for the *Annual Register* and other periodicals, producing also three novels now forgotten. The *Sketches of English History* written for the *Annual Register* from 1785 onward still deserve study. He joined the "Society of Londoners" to Godwin, and was much admired with Lord Stanhope, Horne Tooke and Holcroft. His clerical character was now completely dropped.

In 1793 Godwin published his great work on political science, *The Inquiry concerning Political Justice, and its Influence on General Virtue and Happiness*. Although this work is little known and less read now, it marks a phase in English thought. Godwin could never have been himself a worker on the active stage of life. But he was none the less a power behind the workers, and for its political effect, *Political Justice* takes its place with Milton's *Areopagitica*, and Locke's *Essay on Education* and with Rousseau's *Émile*. By the words "political justice" the author meant "the adoption of any principle of morality and truth into the practice of a community," and the work was therefore an introduction into the principles of society, of government and of morals. For many years Godwin had been "satisfied that monarchy was a species of government unavoidably corrupt," and from desiring a government of the simplest construction, he gradually came to consider that "government by its very nature counteracts the improvement of original mind." Believing in the perfectibility of the race, that there are no inherent principles, and that man is not necessarily evil, he considered that "our virtues and our vices may be traced to the incidents which make the history of our lives, and if these incidents could be divested of every improper tendency, vice would be extinguished from the world." All control of man by man was more or less intolerable, and the day would come when each man, doing what seems right in his own eyes, would also be doing what is in fact best for the community, because all would be guided by principles of pure reason. But all was to be done by discussion, and matured change resulting from discussion. Hence, while Godwin thoughtfully approved of the philosophic schemes of the precursors of the Revolution, he was as far removed as Burke himself from agreeing with the way in which they were carried out. So logical and uncompromising a thinker as Godwin could not go far in the discussion of abstract questions without exciting the most lively opposition in matters of detailed opinion. An affectionate son, and ever ready to give of his hard-earned income to more than one ne'er-do-well brother, he maintained that natural relationship had no claim on man, nor was gratitude to parents or benefactors any part of justice or virtue. In a day when the penal code was still extremely severe, he argued gratefully against all punishments, not only that of death. Property was to belong to him who most wanted it;
accumulated property was a monstrous injustice. Hence marriage, which is law, is the worst of all laws, and as property the worst of all properties. A man so passionless as Godwin could venture thus to argue without suspicion that he did so only to gratify his wayward desires. Portions of this treatise, and only portions, found ready acceptance in those minds which were prepared to receive them. Perhaps no one received the whole teaching of the book. But it gave cohesion and voice to philosophic radicalism; it was the manifesto of a school without which liberalism of the present day had not been. Godwin himself in after days modified his communistic views, but his strong feeling for individualism, his hatred of all restrictions on liberty, his trust in man, his faith in the power of reason remained; it was a manifesto, a renunciation of principles modifying action, even when not wholly ruling it.

In May 1794 Godwin published the novel of Caleb Williams, or Things as they are, a book of which the political object is overlooked by many readers in the strong interest of the story. The book was dramatized by the younger Colman as The Iron Chest. It is one of the few novels of that time which may be said still to live.1 A theorist who lived mainly in his study, Godwin yet came forward boldly to stand by prisoners arraigned of high treason in that same year—1794. The danger to persons so charged was then great, and he deliberately put himself into that same danger for his friends. But when his own trial was discussed in the privy council, Fitt sensibly held that Political Justice, the work on which the charge could best have been founded, was priced at three guineas, and could never do much harm among those who had not three shillings to spare.

From this time Godwin became a notable figure in London society, and there was scarcely an important person in politics, on the liberal side, in literature, art or science, who does not appear familiarly in the pages of Godwin’s singular diary. For forty-eight years, beginning in 1798, and continuing to the very end of his life, Godwin kept a record of every day, of the work he did, the books he read, the friends he saw. Condensed in the highest degree, the diary is yet easy to read when the style is once mastered, and it is a great help to the understanding of his cold, mechanical, unimpassioned character. He carried his method into every detail of life, and lived on his earnings with extreme frugality. Until he made a large sum by the publication of Political Justice, he lived on an average of £120 a year.

In 1797, the intervening years having been spent in strenuous literary labours, he married Mary Wollstonecraft (Godwin, Mary Wollstonecraft). Since both held the same views regarding the slavery of marriage, and since they only married, at all for the sake of possible offspring, the marriage was concealed for some time, and the happiness of the avowed married life was very brief; his wife’s death on the 10th of September left Godwin prostrated by affliction, and with a charge for which he was wholly unfit—his infant daughter Mary, and her stepsister, Fanny Imlay, who from that time bore the name of Godwin. His unfitness for the cares of a family, far more than love, led him to contract a second marriage with Mary Jane Clairmont in 1801. She was a widow with two children, one of whom, Clara Mary Jane Clairmont, became the mistress of Lord Byron. The second Mrs Godwin was energetic and painstaking, but a harsh stepmother; and it may be doubted whether the children were not worse off under her care than they would have been under Godwin’s neglect.

The second novel which proceeded from Godwin’s pen was called St Leon, and published in 1799. It is chiefly remarkable for the beautiful portrait of Marguerite, the heroine, drawn from the person of his own wife. His opinion Wollstonecraft, a change in the direction of theism, influenced, he says, by his acquaintance with Coleridge. He also became known to Wordsworth and Lamb. Study of the Elizabethan dramatists led to the production in 1800 of the Tragedy of Antonio. Kemble brought it out at Drury Lane, but the failure of this attempt made him refuse Abbas, King of Persia, which Godwin offered him in the next year. He was more successful with his Life of Chaucer, for which he received £600. The events of Godwin’s life were few. Under the advice of the second Mrs Godwin, and with her active co-operation, he carried on business as a bookseller under the pseudonym of Edward Baldwin, publishing several useful school books and books for children, among them Charles and Mary Lamb’s Tales from Shakespeare. But the speculation was unsuccessful, and for many years Godwin struggled with constant pecuniary difficulties, for which more than one subscription was raised by the leaders of the Liberal party and by literary men. He became bankrupt in 1822, but during the following years he accomplished one or two valuable works, The History of the Commonwealth, founded on pamphlets and other documents, which still retains considerable value. In 1833 the government of Earl Grey conferred upon him the office known as yeoman usher of the exchequer, to which were attached apartments in Palace Yard, where he died on the 7th of April 1836.

In his own time, by his writings and by his conversation, Godwin had a great power of influencing men, and especially young men. Though his character would seem, from much which is found in his writings, and from anecdotes told by those who still live, to have been sympathetic, it was so well understood by enthusiastic young people that they regarded his words as those of a prophet. The most remarkable of these was Percy Bysshe Shelley, who in the glowing dawn of his genius turned to Godwin as his teacher and guide. The last of the long series of young men who sat at Godwin’s feet was Edward Lyttton Bulwer, afterwards Lord Lyttton, whose early romances were formed after those of Godwin, and who, in Eugene Aram, succeeded to the story as arranged, and the plan to a considerable extent sketched out, by Godwin, whose age and failing health prevented him from completing it. Godwin’s character appears in the worst light in his relations with Shelley; correspondence with Shelley, which began in 1811, is remarkable for its genuine good sense and kindness; but when Shelley carried out the principles of the author of Political Justice in eloping with Mary Godwin, Godwin assumed a hostile attitude that would have been unjustifiable in a man of ordinary views, and was ridiculous in the light of his professions. He was not, moreover, too proud to accept £1000 from his son-in-law, and after the reconciliation following on Shelley’s marriage in 1816, he allowed him to demand money until Shelley’s death. His character had no doubt suffered under his long embarrassments and his unhappy marriage.

Godwin’s more important works are:—The Inquiry concerning Political Justice, and its Influence on General Virtue and Happiness (1793); Things as they are, or, the Adventures of Caleb Williams (1795). The Inquiry, a series of Essays (1797); Memoir of the Author of the Rights of Woman (1798); St Leon, a Tale of the Sixteenth Century (1799); Antonia, a Tragedy (1800); The Life of Chaucer (1803); Fleetwood, a Novel (1806); Paulkner, a Tragedy (1807); Essay on Sepulchres (1808); Lives of Edward and John Philips, the Neighbors of Milton (1812); Mandeville, a Tale of the Times of Cromwell (1817); Of Population, an answer to Malthus (1820); History of the Commonwealth (1824-1828); Cloudesley, a Novel (1830); Thoughts on Man, a series of Essays (1831); Lives of the Necromancers (1834). A volume of essays was also collected from his papers and published in 1873, as left for publication by his daughter Mrs Shelley. Many other short and anonymous works proceeded from his ever busy pen, but many are irrecoverable, and all are forgotten. Godwin’s life was published in 1876 in two volumes, under the title William Godwin, his Friends and Contemporaries, by C. Kegan Paul. The best estimate of his literary position is that given by Sir Leslie Stephen in his English Thought in the 18th Century (ii. 264-284; ed., 1902). See also the article on William Godwin in W. Hambly’s The Cambridge History of Literature in the English Language (1857-1861). Godwin in St. Stephen’s Hours in a Library (vol. iii., ed. 1892).

GODWIN-AUSTEN, ROBERT ALFRED CLOWNE (1808-1884), English geologist, the eldest son of Sir Henry E. Austen, was born on the 17th of March 1808. He was educated at Oriel College, Oxford, of which he became a fellow in 1830. He afterwards entered Lincoln’s Inn. In 1833 he married the only daughter and heirress of General Sir Henry T. Godwin, K.C.B., and he took the additional name of Godwin by Royal licence.

1 For an analysis of Caleb Williams see the chapter on "Theorists of Revolution" in Professor E. Dowden’s The French Revolution and English Literature (1897).
in 1854. At Oxford as a pupil of William Buckland he became deeply interested in geology, and soon afterwards becoming acquainted with De la Beche, he was inspired by that great master, and assisted him by making a geological map of the neighbourhood of Newton Abbot, which was embodied in the Geological Survey map. He also published an elaborate memoir "On the Geology of the South-East of Devonshire" (Trans. Geol. Soc. ser. 2, vol. viii.). His attention was next directed to the Cretaceous rocks of Surrey, his home-county, his estates being situated at Chilworth and Shalford near Guildford. Later he dealt with the superficial accumulations bordering the English Channel, and with the erratic boulders of Sussex. In 1855 he brought before the Geological Society of London his paper on the Coralline shingle of the South-Eastern part of England," in which he pointed out on well-considered theoretical grounds the likelihood of coal-measures being some day reached in that area. In this article he also advocated the freshwater origin of the Old Red Sandstone, and discussed the relations of that formation, and of the Devonian, to the Silurian and Carboniferous. He was elected F.R.S. in 1849, and in 1850 he was awarded the Wollaston medal by the Geological Society of London, on which occasion he was styled Sir R. Murchison "the profoundly the physical geographer of bygone periods." He died at Shalford House near Guildford on the 25th of November 1884.

His son, Lieut.-Colonel Henry Havergam Godwin-Austen (b. 1834), entered the army in 1851, and served for many years on the Trigonometrical Survey of India, retiring in 1877. He gave much attention to geology, but is more especially distinguished for his researches on the natural history of India and as the author of The Land and Freshwater Mollusca of India (1832-1887).

GODWINE (d. 1053), son of Wulnoth, earl of the West-Saxons, the leading Englishman in the first half of the 11th century. His birth and origin are utterly uncertain; but he rose to power early in Canute's reign and was an earl in 1018. He received in marriage Gytha, a connexion of the king's, and in 1020 became earl of the West-Saxons. On the death of Canute in 1035 he joined with Queen Emma in supporting the claim of Hardicanute, the son of Canute and Emma, to the crown of his father, in opposition to Leofric and the northern party who supported Harold Harefoot (see Hardicanute). While together they held Wessex for Hardicanute, the eldest son of Emma by her former husband Æthelred II., landed in England in the hope of winning back his father's crown; but falling into the hands of Godwine, he and his followers were cruelly done to death. On the death of Hardicanute in 1042 Godwine was foremost in promoting the election of Edward (the Confessor) to the vacant throne. He was now the first man in the kingdom, though his power was still balanced by that of the other great earls, Leofric of Mercia and Siward of Northumberland. His sons Swen and Harold were promoted to earldoms; and his daughter Eadgyth was married to the king (1045). His policy was strongly national in opposition to the marked Normanizing tendencies of the king. Between him and Edward's foreign favourites, particularly Robert of Jewiâges, there was deadly feud. The appointment of Robert to the archbishopric of Canterbury in 1051 marks the decline of Godwine's power; and in the same year a series of outrages committed by one of the king's foreign favourites led to a breach between the king and the earl, which culminated in the exile of the latter with all his family (see Edward the Confessor). But next year Godwine returned in triumph; and at a great meeting held outside London he and his family were restored to all their offices and possessions, and the archbishop and many other Normans were banished. In the following year Godwine was smitten with a fit at the king's table, and died three days later on the 15th of April 1053.

Gowin appear to have had seven sons, three of whom—King Harold, Gyth and Leofwine—were killed at Hastings; two others, Wulnoth and Ælfgar, are of little importance; another was Earl Tostig (q.v.). The eldest son was Sveyn, or Svegen (d. 1059), who was outlawed for seducing Eadgifu abbess of Leominster. After fighting for the king of Denmark he returned to England in 1049, when his murder of his cousin Beorn compelled him to leave England for the second time. In 1050, however, he regained his earldom, and in 1051 he shared his father's exile. To atone for the murder of Beorn, Sveyn went on a pilgrimage to Jerusalem, and on the return journey he died on the 29th of September 1052, meeting his death, according to one account, at the hands of the Saracens.

GODWIT, a word of unknown origin, the name commonly applied to a marsh-bird in great repute, when fattened, for the table, and formerly abundant in the fens of Norfolk, the Isle of Ely and Lincolnshire. In Turner's days (1544) it was worth more than a sheep, and at the end of the year Belon said of it—"C'est vn Oysseau es delices des Francois." Casaubon, who Latinized its name "Dei ingenium (Ephemerides, 19th September 1611), was told by the "ornithotrophaeus" he visited at Wisbech that in London it fetched twenty pence. Its fame as a delicacy is perpetuated by many later writers, Ben Jonson among them, and Pennant says that in his time (1760) it sold for half-a-crown or five shillings. Under the name godwit two perfectly distinct species of British birds were included, but that which seems to have been especially prized is known to modern writers as the black-tailed godwit, Limosa limosa, formerly called, from its loud cry, a warwelp,1 shrieker or barker, in the districts it inhabited. The practice of netting this bird in large numbers during the spring and summer, coupled with the gradual declamation of the fens, to which it resorted, has now rendered it but a visitor in England; and it probably ceased from breeding regularly in England in 1824 or thereabouts, though under favourable conditions it may have occasionally laid its eggs for some thirty years later or more (Stevenson, Birds of Norfolk, ii. 350). This godwit is a species of wide range, reaching Iceland, where it is called Jarðraeks (=sand-raker), in summer, and occurring numerous in India in winter. Its chief breeding-quarters seem to extend from Holland eastwards to the south of Russia. The second British species is that which is known as the bar-tailed godwit, L. lapponica, and this seems to have never been more than a bird of double passage in the United Kingdom, arriving in large flocks on the south coast about the 12th of May, and, after staying a few days, proceeding to the north-eastward. It is known to breed in Lapland, but its eggs are of great rarity. Towards autumn the young visit the English coasts, and a few of them remain, together with some of the other species, in favourable situations throughout the winter. One of the local names by which the bar-tailed godwit is known to the Norfolk gunners is scavall, a word which, in the mouth of Caliban (Tempest, ii. ii.), has been the cause of much perplexity to Shaksperean critics.

The godwits belong to the group Limicola, and are about as big as a tame pigeon, but possess long legs, and a long bill with a slight upward turn. It is believed that in the genus Limosa the female is larger than the male. While the winter plumage is of a sober greyish-brown, the breeding-dress is marked by a predominance of bright bay or chestnut, rendering the wearer a very beautiful object. The black-tailed godwit, though varying a good deal in size, is constantly larger than the bar-tailed, and especially longer in the legs. The species may be further distinguished by the former having the proximal third of the tail-plumes pure white, and the distal two-thirds black, with a narrow white margin, while the latter has the same feathers barred with black and white alternately for nearly their whole length.

America possesses two species of the genus, the very large marbled godwit or marlign, L. fado, easily recognized by its size and the buff colour of its underparts, and the small Hudsonian godwit, L. hudsonica, which has its axillaries of a deep black. This last, though less numerous than its congener, seems to range over the whole of the continent, breeding in the extreme north, while it has been obtained also in the Strait of Magellan and the Falkland Islands. The first seems not to go farther southward than the Antilles and the Isthmus of Panama.

1 This name seems to have survived in Whelp Moor, near Brandon, in Suffolk.
From Asia, or at least its eastern part, two species have been described. One of them, *L. melanuroides*, differs only from *L. aequocephala* in its smaller size, and is believed to breed in Amurland, wintering in the islands of the Pacific, New Zealand and Australia. The other, *L. uropygialis*, is closely allied to and often mistaken for *L. lapponica*, from which it chiefly differs by having the rump barred like the tail. This was found breeding in the extreme north of Siberia by Dr von Middendorff, and ranges to Australia, whence it was, like the last, first described by Gould.

**GOEBEN, AUGUST KARL VON** (1816–1880), Prussian general of infantry, came of old Hanoverian stock. Born at Stade on the 10th of December 1816, he was educated chiefly under the influence of the Rev. Dermbach, who was vicar of Rackebiill close to the city and the Christian service rather than that of his own country, and at the age of seventeen obtained a commission in the 24th regiment of Prussian Infantry. But there was little scope there for the activities of a young and energetic subaltern, and, leaving the service in 1836, he entered the Carlist army campaigning in Spain. In the five campaigns which he made in the service of Don Carlos he had many and various vicissitudes of fortune. He had not fought for two months when he fell, severely wounded, into the hands of the Spanish Royal troops. After eight months' detention he escaped, but it was never long after he had ventured again too far from the path of safety. Prison life was imprisonment and painful, and on two occasions he was compelled to draw lots for his life with his fellow-captives. When released, he served till 1840 with distinction. In that year he made his way back, a beggar without means or clothing, to Prussia. The Carlist lieutenant-colonel was glad to be re-admitted into the Prussian service as a second lieutenant, but he was still young, and few subalterns could at the age of twenty-four claim five years' meritorious war service. In a few years we find him serving as captain on the Great General Staff, and in 1848 he had the good fortune to be transferred to the staff of the IV. army corps, his immediate superior being Major von Moltke. The two “coming men” became fast friends, and their mutual esteem was never disturbed. In the Baden insurrection Goeben served with distinction on the staff of Prince William, the future emperor. Staff and regimental duty (as usual in the Prussian service) alternated for some years after this, till in 1853 he became major-general commanding the 26th infantry brigade. In 1850, it should be mentioned, he was present with the Spanish troops in Morocco, and took part in the battle of Sebaubad.

In the first of Prussia's great wars (1864) he distinguished himself at the head of his brigade at Rackebiill and Sonderburg. In the war of 1866 Lieutenant-General von Goeben commanded the 13th division, of which his old brigade formed part, and, in this higher sphere, once more displayed the qualities of a born leader and skilful tactician. He held almost independent command with conspicuous success in the actions of Dernbach, Laufach, Kissingen, Aschaffenburg, Gerchsheim, Tauber-Bischofsheim and Würzburg. The mobilization of 1870 placed him at the head of the VIII. (Rhineland) army corps, forming part of the First Army under Steinmetz. It was his resolute and energetic leadership that contributed mainly to the victory of Spicheren (6th August), and won the only laurels gained on the Prussian right wing at Gravelotte (8th August). Under Manteuffel the VIII. corps took part in the operations about Amiens and Bapaume, and on the 8th of January 1871 Goeben succeeded in general that in the command of the First Army, with which he had served throughout the campaign as a corps commander. A fortnight later he had brought the war in northern France to a brilliant conclusion, by the decisive victory of St Quentin (18th and 19th January 1871). The close of the Franco-German War left Goeben one of the most distinguished men in the victorious army. He was colonel of the 28th infantry, and had the grand cross of the Iron Cross. He commanded the VIII. corps at Coblenz until his death in 1880.

General von Goeben left many writings. His memoirs are to be found in his works *Vier Jahre in Spanien* (Hanover, 1841), *Reise und Lagerbriefe aus Spanien und von spanischen Heere in Marokko* (Hanover, 1863) and in the Darmstadt *Allgemeine Militärzeitung*. The former French port (Queuelu) at Metz was renamed Goeben after him, and the 28th infantry bears his name. A statue of Goeben by Schaper was erected at Coblenz in 1884. See G. Zerlin, *Das Leben des Generals August von Goeben* (2 vols., Berlin, 1895–1897); H. Barth, *A von Goeben* (Berlin, 1902); and, for his share in the war of 1870–71; H. Kunz, *Der Feldzug im N. und Mittelmeer* (2 vols., Vienna, 1889), and the 14th Monograph of the General Staff (1891).

**GOEJE, MICHAEL JAN DE** (1836–1900), Dutch orientalist, was born in Friesland in 1836. He devoted himself at an early age to the study of oriental languages and became especially proficient in Arabic, under the guidance of Dozy and Juynboll, to whom he was afterwards an intimate friend and colleague. He took his degree of doctor at Leiden in 1860, and then studied for a year in Oxford, where he examined and collated the Bodleian MSS. of Idrisī (part being published in 1866, in collaboration with R. P. Dozy, as *Description de l'Afrique et de l'Espagne*). About the same time he wrote *Mémoires de l'histoire et de la géographie orientales*, and edited *Exégétique regionum*. In 1883, on the death of Dozy, he became Arabic professor at Leiden, retiring in 1906. He died on the 17th of May 1909. Though perhaps not a teacher of the first order, he wielded a great influence during his long professoriate not only over his pupils, but also over the field of research in which he was himself engaged. Many of his lectures, and his many editions of Arabic texts have been of the highest value to scholars, the most important being his great edition of *Tabari*. Though entirely avers from politics, he took a keen interest in the municipal affairs of Leiden and made a special study of elementary education. He took the leading part in the International Congress of Orientalists at Algiers in 1905. He was a member of the Institut de France, was awarded the German Order of Merit, and received an honorary doctorate of Cambridge University. At his death he was president of the International Association of Academies of Science.

Among his chief works are *Fragmenta historiorum Araborum* (1860–1871); *Diwan of Mālik Ibn al-Wālid* (1873); *Bibliotheca geographorum Araborum* (1870–1894); *Annals of Tabari* (1879–1901); edition of Ibn Qutaiba's biographies (1904); of the travels of Ibn Jubayr (1907, 5th vol. of Gibb Memorial). He was also the chief editor of the *Encyclopædia of Islam* (vols. i.-iii.), and contributed many articles to periodicals. He wrote for the 4th and the present edition of the *Encyclopædia Britannica*.

**DAMIÃO DE** (1502–1574), Portuguese humanist, was born of a patrician family at Alemquer, in February 1502. Under King John III. he was employed abroad for many years from 1525 on diplomatic and commercial missions, and he travelled over the greater part of Europe. He was intimate with the leading scholars of the time, was acquainted with Luther and other Protestant divines, and in 1532 became the pupil and friend of Erasmus. Goes took his degree at Padua in 1538 after a four years' course. In 1537, at the instance of his friend Cardinal Sadolet, he undertook to mediate between the Church and the Lutherans, but failed through the attitude of the Protestants. He married in Flanders a rich and noble Dutch lady, D. Joanna de Hargen, and settled at Louvain, then the literary centre of the Low Countries, where he was living in 1542 when the French besieged the town. He was given the command of the defending forces, and saved Louvain, but was taken prisoner and confined for nine months in France, till he obtained his freedom by a heavy ransom. He was rewarded, however, by a grant of arms from Charles V. He finally returned to Portugal in 1545, with a view of becoming tutor to the king's sons, but he failed to obtain this post, owing to the denunciations of Father Simon Rodriguez, provincial of the Jesuits, who accused Goes of favouring the Lutheran doctrines and of being a disciple of Erasmus. Nevertheless in 1548 he was appointed chief keeper of the archives and royal chronicler, and at once introduced some much-needed reforms into the administration of his office.

In 1558 he was given a commission to write a history of the reign of King Manoel, a task previously confided to João de Barros, but relinquished by him. It was an onerous undertaking for a conscientious historian, since it was necessary to expose
GOES, H. VAN DER—GOES 181

the miseries as well as relate the glories of the period, and so to offend some of the most powerful families. Goes had already written a Chronicle of Prince John (afterwards John II), and when the first volume of it was published he produced the First Part of his Chronicle of King Manoel (1566), a chorus of attacks greeted it, the edition was destroyed, and he was compelled to issue a revised version. He brought out the three other parts in 1566-1567, though chapters 23 to 27 of the Third Part were so mutilated by the censorship that the printed text differs largely from the MS. Hitherto Goes, notwithstanding his Liberalism, had escaped the Inquisition, though in 1540 his Fides, religio, moresque Athiophum had been prohibited by the chief inquisitor, Cardinal D. Henrique; but the denunciation of Falstaff, he having vainly beheaded a horse in 1530, was now brought into action, and in 1571 he was arrested to stand his trial. There seems to be no doubt that the Inquisition made itself on this occasion, as on others, the instrument of private enmity; for eighteen months Goes lay ill in prison, and then he was condemned, though he had lived for thirty years as a faithful Catholic, and the worst that could be proved against him was that in his youth he had spoken against Indulgences, disbelieved in auricular confession, and consorted with heretics. He was condemned to the term of reclusion, and his property was confiscated to the commonwealth. He was buried in private, he was sent at the end of 1572 to do penance at the monastery of Batalha. Later he was allowed to return home to Alemquer, where he died on the 30th of January 1574. He was buried in the church of Nossa Senhora da Varzea.

Damião de Goes was a man of wide culture and genial and courtly manners, a skilled musician and a good linguist. He wrote both Portuguese and Latin with classic strength and simplicity, and his style is free from affectation and rhetorical ornaments. His portrait by Albrecht Dürer shows an open, intelligent face, and the record of his life proves him to have been upright and fearless. His prosperity doubtless excited ill-will, but above all, his ideas, advanced for Portugal, his foreign ways, outspokenness and honesty contributed to the tragedy of his end, at a time when the forces of ignorant reaction held the ascendant. He had, it may be presumed, given some umbrage to the court by condemning, in the Chronicle of King Manoel, the royal ingratitude to distinguished public servants, though he received a pension and other rewards for that work, and he had certainly offended the nobility, and the chosen ones of the office of and by exposing false genealogical claims in his Nobiliário. He paid the penalty for telling the truth, as he knew it, in an age when an historian had to choose between flattery of the great and silence. The Chronicle of King Manoel was the first official history of a Portuguese reign to be written in a critical spirit, and Damião de Goes has the honour of having been the first Portuguese royal chronicler to deserve the name of an historian.

His Portuguese works include Chronica do felicissimo rei Dom Emanuel (parts i. and ii., Lisbon, 1566, parts iii. and iv., ib. 1592). Other editions appeared in Lisbon in 1619 and 1749 and in Coimbra in 1793. The Portion de principe Dom Joam (Lisbon, 1558), with subsequent editions in 1567 and 1724 in Lisbon and in 1790 in Coimbra. Livro de Marco Tulio Cicero chamado Catam Mayor (Venice, 1538). This is a translation of Cicero's De senectute. His Latin works include: (3) Legatae et legationum per partes &c. (Bologna, 1531); (1) Commentarii curum gestarum in India (Louvain, 1530); (4) Fides, religio, moresque Athiophum (Louvain, 1540), incorporating Nos. (1) and (2); (5) Hispania (Louvain, 1542); (6) Allegatae epistolae Sodobi Bemeli et aliorum clarissimorum virorum, &c. (Louvain, 1544); (7) Damianii a Goes equitis Lusitani aliquot opuscula (Louvain, 1545); (8) Lusitanorum obulia (Lisbon, 1546); (9) De bellis et bellis ultimo (Louvain, 1549); (10) Urbis Orientalis descriplos (Exvra, 1554); (11) Epistola ad Hieronymum Cardo- sum (Lisbon, 1556). Most of the above went through several editions, and many portions were included in new works in such collections as No. (7), and seven sets of Opuscula appeared, all incomplete. Nos. (3), (4), and (5) suffered mutilation in subsequent editions, at the hands of the censors, because they offended against religious orthodoxy or fanatical preoccupations.

Authorities.—(A) Joaquim de Vasconcellos, Goestana (5 vols.), with the following sub-titles: (1) O Retrato de Albrecht Dürer (Porto, 1879); (2) Bibliographia (Porto, 1879), which describes 67 numbers of books by Goes; (3) As Variantes das Chronicas Portu- genses (Porto, 1881); (4) Damião de Goes: Estudos de (Porto, 1897); (5) As Cartas Latinoes—in the press (1906). GOES, HUGO VAN DER (d. 1482), a painter of considerable celebrity at Ghent, was known to Vasari, as he is known to us, by a single picture in a Florentine monastery. At a period when the family of the Medici had not yet risen from the rank of a great mercantile firm to that of a reigning dynasty, it employed as an agent at the port of Bruges Tommaso Portinari, a lineal descendant, it was said, of Folco, the father of Dante's Beatrice. Tommaso, at that time patron of a chapel in the hospital of Santa Maria Nuova at Florence, ordered an altar-piece of Hugo van der Goes, and commanded him to illustrate the sacred subject of Christ attended by Shepherds and Angels. On the wings he portrayed Tommaso and his two sons in prayer under the protection of Saint Anthony and St Matthew, and Tommaso's wife and two daughters supported by St Margaret and St Mary Magdalen. The triptych, which has suffered much decay and restoration, was for over 400 years at Santa Maria Nuova, and is now in the Uffizi Gallery. Imposing because composed of figures of unusual size, the altar-piece is more remarkable for portrait character than for charms of ideal beauty.

There are also small pieces in public galleries which claim to have been executed by Van der Goes. One of these pictures in the National Gallery in London is more nearly allied to the school of Memling than to the triptych of Santa Maria Nuova; another, a small and very beautiful "John the Baptist," at the Pinakothen of Munich, is really by Memling; whilst numerous fragments of an altarpiece in the Belvedere at Vienna, though assigned to Hugo, are by his more gifted countryman of Bruges. Van der Goes, however, was not habitually a painter of easel pieces. He showed that he was a master of his gild in 1465, he designed cartoons for glass windows. He also made decorations for the wedding of Charles the Bold and Margaret of York in 1468, for the festivals of the Rhetoricians and papal jubilees on repeated occasions, for the solemn entry of Charles the Bold into Ghent in 1470-1471, and for the funeral of Philip the Good in 1474. The labour which he expended on these occasions might well add to his fame without being the less ephemeral. About the year 1475 he retired to the monastery of Rouge Cloître near Ghent, where he took the cowl. There, though he still clung to his profession, he seems to have taken to drinking, and at one time to have shown decided symptoms of insanity. But his superiors gradually cured him of his intemperance, and he died in the odour of sanctity in 1482.

GOES, a town in the province of Zeeland, Holland, on the island of South Beveland, 11½ m. by rail E. of Middelburg. Pop. (1900) 6919. It is connected by a short canal with the East Scheldt, and has a good harbour (1816) defended by a fort. The principal buildings are the interesting Gothic church (1423) and the picturesque old town hall (restored 1735). There are various educational and charitable institutions. Goes has preserved for centuries its prosperous position as the market-town of the island. The chief industries are boat-building, brewing, bookbinding and cigarette-making. The town had its origin in the castle of Oostende, built here by the noble family of Borssele. It received a charter early in the 15th century from the countess Jacoba of Holland, who frequently stayed at the castle.
GOETHE, JOHANN WOLFGANG VON (1749-1832), German poet, dramatist and philosopher, was born at Frankfort-on-Main on the 28th of August 1749. He came, on his father's side, of Thuringian stock, his great-grandfather, Hans Christian, having been mayor of the borough at Artern-on-the-Unstrut, about the middle of the 17th century. Hans Christian's son, Friedrich Georg, was brought up to the trade of a tailor, and in this capacity settled in Frankfort in 1686. A second marriage, however, brought him into possession of the Frankfort inn, "Zum Weidenhof," and he ended his days as a well-to-do innkeeper. His son, Johann Kaspar, the poet's father (1710-1782), studied law at Leipsig, and, after going through the prescribed courses of practical training at Wetzlar, travelled in Italy. In 1730 he returned to Frankfort, to obtain an official position in the government of the free city, but his personal influence with the authorities was not sufficiently strong. In his disappointment he resolved never again to offer his services to his native town, and retired into private life, a course which his ample means facilitated. In 1742 he acquired, as a consoliation for the public career he had missed, the title of kaiserlicher Rat, and in 1748 married Katharina Elisabeth (1731-1808), daughter of the Schultheiss or Bürgermeister of Frankfort, Johann Wolfgang Tsector. The poet was the eldest son of this union. Of the later children of this couple, born 1750, three survived the years of childhood; she died as the wife of Goethe's friend, J. G. Schlosser, in 1777. The best elements in Goethe's genius came from his mother's side; of a lively, impulsive disposition, and gifted with remarkable imaginative power, Frau Rat was the ideal mother of a poet; moreover, being hardly eighteen at the time of her son's birth, she was herself able to be the companion of his childhood. From his father, whose stern, somewhat pedantic nature repelled warmer feelings on the part of the children, Goethe inherited that "holy earnestness" and stability of character which brought him unshaken through temptations and passions, and held the balance to his all too powerful imagination.

Unforgettable is the picture which the poet subsequently drew of his childhood spent in the large house with its many nooks and crannies, in the Grosse Hirschgraben at Frankfort. Books, pictures, objects of art, antiquities, reminiscences of Rat Goethe's visit to Italy, above all a marionette theatre, kindled the child's quick intellect and imagination. His training was conducted through the earlier stages by his father's direction, supplemented by tutors. Meanwhile the varied and picturesque life of Frankfort was in itself an education. In 1759, during the Seven Years' War, the French, as Maria Theresa's allies, occupied the town, and, much to the irritation of Goethe's father, who was a staunch partisan of Frederick the Great, a French lieutenant, Count Thoranc, was quartered on the Goethe household. The foreign occupation also led to the establishment of a French troupe of actors, and to their performances the boy, through his grandfather's influence, had free access. Goethe has also recorded his memories of another picturesque event, the coronation of the emperor Joseph II. in the Frankfort Römer or town hall in 1764; but these memories were darkened by being associated in his mind with the tragic dénouement of his first love affair. The object of this passion was a certain Gretchen, who seems to have taken advantage of the boy's interest in her to further the dishonest ends of one of her friends. The discovery of the affair and the investigation that followed cooled Goethe's ardour and caused him to turn his attention seriously to the studies which were to prepare him for the university. Meanwhile the literary instinct had begun to show itself; we hear of a novel in letters—a kind of linguistic exercise, in which the characters carried on the correspondence in different languages—at a prose epic on the subject of Joseph, and various religious poems of which one, Die Höllenfahrt Christi, found its way in a revised form into the poet's complete works.

In October 1765, Goethe, then a little over sixteen, left Frankfort for Leipzig, where a wider and, in many respects, less provincial life awaited him. He entered upon his university studies with zeal, but his own education in Frankfort had not been the best preparation for the scholastic methods which still dominated the German universities; of his professors, only Gellert seems to have won his interest, and that interest was soon soon quenched. The literary beginning he has made in Frankfort now seemed to him amaturish and trivial; he felt that he had to turn over a new leaf, and, under the guidance of E. W. Behrisch, a genial, original comrade, he learned the art of writing those light Anacreontic lyrics which harmonized with the tone of polite Leipzig society. Artificial as this poetry is, Goethe was, nevertheless, inspired by a real passion in Leipzig, namely, for Anna Katharina Schönkopf, the daughter of a wine-merchant at whose house he dined. She is the "Annette" after whom the recently discovered collection of lyrics was named, although it must be conceded that her beauty was not at first obvious. In 1770, express very directly Goethe's feelings for Kathchen Schönkopf. To his Leipzig student-days belong also two small plays in Alexandrines, Die Laune des Verliebten, a pastoral comedy in one act, which reflects the lighter side of the poet's love affair, and Die Mitschuldigen (published in a revised form, 1750), a more sombre picture, in which comedy is incongruously mingled with tragedy. In Leipzig Goethe also had time for what remained one of the abiding interests of his life, for art; he regarded A. F. Oeser (1717-1759), the director of the academy of painting in the Pleissenburg, who had given him lessons in drawing, as the teacher who in Leipzig had influenced him most. His art studies were also furthered by a short visit to Dresden. His stay in Leipzig came, however, to an abrupt conclusion; the distractions of student life proved too much for his strength; a sudden haemorrhage supervened, and he lay long ill, first in Leipzig, and, after it was possible to remove him, at home in Frankfort. These months of slow recovery were a time of serious introspection for Goethe. He still corresponded with his Leipzig friends, but the retirement of his letters changed; life had become grave and more earnest for him. He poured over books on occult philosophy; he busied himself with alchemy and astrology. A friend of his mother's, Susanne Katharina von Klettenberg, who belonged to that circle in Frankfort, turned the boy's thoughts to religious mysticism. On his recovery his father resolved that he should complete his legal studies at Strassburg, a city which, although then outside the German empire, was, in respect of language and culture, wholly German. From the first moment Goethe set foot in the narrow streets of the Alsatian capital, in which the Francophile so long had thought seemed to change. The Gothic architecture of the Strasburg mesterschule, to him the symbol of a national and German ideal, directly antagonistic to the French tastes and the classical and rationalistic atmosphere which prevailed in Leipzig. The second moment of importance in Goethe's Strassburg period was his meeting with Herder, who spent some weeks in Strassburg undergoing an operation of the eye. In this thinker, who was his senior by five years, Goethe found the master he sought; Herder taught him the signification of Gothic architecture, revealed to him the charm of nature's simplicity, and inspired him with enthusiasm for Shakespeare and the Volkslied. Meanwhile Goethe's legal studies were not neglected, and he found time to add to knowledge of other subjects, notably that of medicine. Another factor of importance in Goethe's Strassburg life was his love for Friederike Brion, the daughter of an Alsatian village pastor in Sessenheim. Even more than Herder's precept and example, this passion showed Goethe how trivial and artificial had been the Anacreontic and pastoral poetry with which he had occupied himself in Leipzig; and the lyrics inspired by Friederike, such as Kleine Blumen, kleine Blätter and Wie herrlich leuchtet mir die Natur, mark the beginning of a new epoch in German lyric poetry. The idyll of Sessenheim, as described in Dichtung und Wahrheit, is one of the most beautiful love-stories in the literature of the world. From the first, however, it was clear that Friederike Brion could never become the wife of the Frankfort patrician's son; an unhappy ending to the romance was unavoidable, and, as is to be seen in passionate outpourings like the Wanderers Sturmgedicht, and in the bitter self-accusations of Clavigo, it left deep wounds on the poet's sensitive soul.
To Strassburg we owe Goethe's first important drama, *Götz von Berlichingen*, as it was called in its earliest form, *Gestehniss von Berlichingen dramatisiert* (not published until 1831). Revised under the now familiar title, it appeared in 1773, after Goethe's return to Frankfurt. In estimating this drama we must bear in mind Goethe's own Strassburg life, and the turbulent spirit of his own age, rather than the historical facts, which the poet found in the autobiography of his hero published in 1731. The latter supplied only the rough materials; the Götz von Berlichingen whom Goethe drew, with his lofty ideals of right and wrong, and his enthusiasm for freedom, is a very different personage from the Homeric hero of the 16th century, the rough friend of Franz von Sickingen and of the revolted peasants. Still less historical justification is to be found for the vacillating Weisliczen in whom Goethe executed poetic justice on himself as the lover of Friederike, or in the women of the play, the gentle Maria, the heartless Adelheid. But there is genial, creative power in the very subjectivity of these characters, and a vigorous dramatic life, which is irresistible in its appeal. With *Götz von Berlichingen*, Shakespeare's art first triumphed on the German stage, and the literary movement known as *Sturm und Drang* was inaugurated.

Having received his degree in Strassburg, Goethe returned home in August 1771, and began his initiation into the routine of an advocate's profession. In the following year, in order to gain insight into another side of his calling, he spent four months at Wetzlar, where the imperial law-courts were established. But Goethe's professional duties had only a small share in the eventful years which lay between his return from Strassburg and that visit to Weimar at the end of 1775, which turned the whole course of his career, and resulted in his permanent attachment to the Weimar court. Goethe's life in Frankfort was a round of stimulating literary intercourse; in J. H. Merck (1714-1791), an army official in the neighbouring town of Darmstadt, he found a friend and mentor, whose irony and common-sense served as a corrective to his own exuberance of spirits. Wetzlar brought new friends and another passion, that for Charlotte Buff, the daughter of the *Ammann* there—a love-story which has been immortalized in *Werthers Leiden*—and again the young poet's nature was obsessed by a love which was this time strong enough to bring him to the brink of that suicide with which the novel ends. A visit to the Rhine, where new interests and the attractions of Maximiliane von Laroche, a daughter of Wieland's friend, the novelist Sophie von Laroche, brought partial healing; his intense preoccupation with literary work on his return to Frankfort did the rest. In 1775 Goethe was attracted by still another type of woman, Lili Schönemann, whose mother was the widow of a wealthy Frankfort banker. A formal betrothal took place, and the beauty of the lyrics which Lili inspired leaves no room for doubt that here was a passion no less genuine than that for Friederike or Charlotte. But Goethe—more worldly wise than on former occasions—felt instinctively that the gay, social world in which Lili moved was not really congenial to him. A visit to Switzerland in the summer of 1775 may not have weakened his interest in her, but it at least allowed him to regard her objectively; and, without tragic consequences on either side, the passion was ultimately allowed to yield to the dictates of common-sense. Goethe's departure for Weimar in November made the final break less difficult.

The period from 1771 to 1775 was, in literary respects, the most productive of the poet's life. It had been inaugurated with *Götz von Berlichingen*, and a few months later this tragedy was followed by another, *Clavigo*, hardly less convincing in character-drawing, and reflecting even more faithfully than the former the experiences Goethe had gone through in Strassburg. Again poetic justice is effected on the unfortunate hero who has chosen his own personal advancement in preference to his duty to the woman he loves; more pointedly than in *Götz* is the moral enforced by Clavigo's worldly friend Carlos, that the ground of Clavigo's tragic end lies not so much in the defiance of a moral law as in the hero's vacillation and want of character. With *Die Leiden des jungen Werthers* (1774), the literary precipitate of the author's own experiences in Wetzlar, Goethe succeeded in attracting, as no German had done before him, the attention of Europe. Once more it was the gospel that the world belongs to the strong, which lay beneath the surface of this romance. This, however, was not the lesson which was drawn from it by Goethe's contemporaries; they shed tears of sympathy over the lovelorn youth whose burden becomes too great for him to bear. While *Götz* inaugurated the manlier side of the *Sturm und Drang* literature, *Werther* was responsible for its sentimental excesses. And to the sentimental rather than to the heroic side belongs also *Stella*, "a drama for lovers," in which the poet again reproduced, if with less fidelity than in *Götz*, certain aspects of his own love troubles. A vein is to be observed in various dramatic satires written at this time, such as *Götter, Helden und Wieland* (1774), *Hanswursts Hochzeit*, *Fastnachtsspiel vom Pater Brey*, Satyros, and in the *Singspide*, *Emilie* (1775) and *Claudine von Villa Bella* (1776); while in the *Frankfurter Gedichte Anzeiger* (1772-1773), Goethe drove home the principles of the new movement of *Sturm und Drang* in terse and pointed criticism. The exuberance of the young poet's genius is also to be seen in the many unfinished fragments of this period: at one time we find him at work on both dramas of Werther and Mahomet, and at another on an epic on *Der ewige Jude*, and again with a tragedy on *Prometheus*, of which a magnificent fragment has passed into his works. Greatest of all the torsos of this period, however, was the dramatization of *Faust*. Thanks to a manuscript copy of the play in its earliest form—discovered as recently as 1887—we are now able to distinguish how much of this tragedy was the immediate product of the *Sturm und Drang*, and to understand the intentions with which the young poet began his masterpiece. Goethe's hero changed with the author's ripening experience and with his new conceptions of man's place and duties in the world, but the Gretchen tragedy was taken over into the finished poem, practically unaltered, from the earliest *Faust of the Sturm und Drang*. With these wonderful scenes, the most intensely tragic in all German literature, Goethe's poetry in this period reaches its climax. Still another important work, however, was conceived, and, in large measure written at this time, the drama of *Egmont*, which was not published until 1788. This work may, to some extent, be regarded as supplementary to *Faust*; it presents the lighter, more cheerful and optimistic side of Goethe's philosophy in these years; Graf Egmont, the most winning and fascinating of the poet's heroes, is endowed with that "demonic" power over the sympathies of men and women, which Goethe himself possessed in so high a degree. But *Egmont* depends for its interest almost solely on two characters, Egmont himself and Klärchen, Gretchen's counterpart; regarded as a drama, it demonstrates the futility of that defiance of convention and rules with which the *Sturm und Drang* set out. It remained for Goethe, in the next period of his life, to construct on classic models a new vehicle for German dramatic poetry.

In December 1774 the young "hereditary prince" of Weimar, Charles Augustus, passing through Frankfort on his way to Paris, came into personal touch with Goethe, and invited the poet to visit Weimar when, in the following year, he took up the reins of government. In October 1775 the invitation was repeated, and on the 7th of November of that year Goethe arrived in the little Saxon capital which was to remain his home for the rest of his life. During the first few months in Weimar the poet gave himself up to the pleasures of the moment as unrestrainedly as his patron; indeed, the Weimar court even looked upon him for a time as a tempter who led the young duke astray. But the latter, although himself a mere stripling, had implicit faith in Goethe, and a firm conviction that his genius could be utilized in other fields besides literature. Goethe was not long in Weimar before he was entrusted with responsible state duties, and events soon justified the duke's confidence. Goethe proved the soul of the Weimar government, and a minister of state of energy and foresight. He interested himself in agriculture, horticulture and mining, which were of paramount importance to the welfare of the duchy, and out of these interests sprang his own love for the natural sciences, which took up so much of his time in later
years. The inevitable love-interest also was not wanting. As Friederike hit into the background of Goethe’s Strassburg life, Lotte into that of Wetzlar, and Lilli into the gaieties of Frankfort, so now Charlotte von Stein, the wife of a Weimar official, was the personification of the more aristocratic ideals of Weimar society. We possess only the poet’s share of his correspondence with Frau von Stein, but it is possible to infer from it that, of all Goethe’s loves, this was intellectually the most worthy of him. Frau von Stein was a woman of refined literary taste and culture, seven years older than he and the mother of seven children. There was something more spiritual, something that partook rather of the passionate friendships of the 18th century than of love in Goethe’s relations with her. Frau von Stein kept up a correspondence with the poet until his journey to Italy in 1786–1788. Of other events of this period the most notable were two winter journeys, the first in 1777, to the Harz Mountains, the second, two years later, to Switzerland—journeys which gave Goethe scope for that introspection and reflection for which his Weimar life left him little time. On the second of these journeys he revisited Friederike in Sessenheim, saw Lilli, who had married and settled in Strassburg, and made the personal acquaintance of Lavater in Zürich.

The literary results of these years cannot be compared with those of the preceding period; they are virtually limited to a few wonderful lyrics, such as Wanderers Nachtlied, An den Mond, Gesang der Geister über den Wassern, or ballads, such as Der Erlkönig, a charming little drama, Die Geschwister (1776), in which the poet’s relations to both Lilli and Frau von Stein seem to be reflected, a dramatic satire, Der Triumph der Empfindsamkeit (1778), and a number of Singspiele, Lila (1777), Die Fischerin, Scherz, List und Rache, and Jery und Bätya (1780). But greater works were in preparation. A religious epic, Die Geheimnisse, and a tragedy Elpenor; did not, it is true, advance much further than the plans; but in 1777, under the influence of the theatrical experiments at the Weimar court, Goethe conceived and in great measure wrote a novel of the theatre, which was to have borne the title Wilhelm Meisters theatrical Sendung; and in 1779 himself put in a representation before the court at Ettersburg, of his drama Iphigenia auf Tauris. This Iphigenia was, however, in prose; in the following year Goethe remoulded it in iambics, but it was not until he went to Rome that the drama finally received the form in which we know it.

In September 1778, Goethe set out from Karlsbad—secretly and stealthily, his plan known only to his servant—on that memorable journey to Italy, to which he had looked forward with such intense longing; he could not cross the Alps quickly enough, so impatient was he to set foot in Italy. He travelled by way of Munich, the Brenner and Lago di Garda to Verona and Venice, and from thence to Rome, where he arrived on the 29th of October 1786. Here he gave himself up unreservedly to the new impressions which crowded on him, and he was soon at home among the German artists in Rome, who welcomed him warmly. In the spring of 1787 he extended his journey as far as Naples and Sicily, returning to Rome in June 1789, where he remained until his final departure for Germany on the 2nd of April 1788. It is difficult to exaggerate the importance of Goethe’s Italian journey. He himself regarded it as a kind of climax to his life; never before had he attained such complete understanding of his genius and mission in the world; it afforded him a vantage-ground from which he could renew the past and make plans for the future. In Weimar he had felt that he was no longer in sympathy with the Sturm und Drang, but it was Italy which first taught him clearly what might take the place of that movement in German poetry. To the modern reader, who may well be impressed by Goethe’s extraordinary receptivity, it may seem strange that his interests in Italy were so limited; for, after all, he saw comparatively little of the art treasures of Italy. He went to Rome in Winckelmann’s footsteps; it was the antique he sought, and his interest in the artists of the Renaissance was virtually restricted to their imitation of classic models. This search for the classic ideal is reflected in the works he completed or wrote under the Italian sky. The calm beauty of Greek tragedy is seen in the new iambic version of Iphigenie auf Tauris (1787); the classicism of the Renaissance gives the ground-tone to the wonderful drama of Torquato Tasso (1790), in which the conflict of poetic genius with the prosaic world is transmuted into imperishable poetry. Classic, too, in this sense, were the plans of a drama on Iphigenie auf Delphos and of an epic, Neusikoa. Most interesting of all, however, is the reflection of the classic spirit in works already begun in earlier days, such as Egmont and Faust. The former drama was finished in Italy and appeared in 1788, the latter was brought a step further forward, part of it being published as a Fragment in 1790.

Disappointment in more senses than one awaited Goethe on his return to Weimar. He came back from Italy with a new world of knowledge, a life’s work of epic proportions, with very definite ideas of what constituted literary excellence. But Germany had not advanced; in 1788 his countrymen were still under the influence of that Sturm und Drang from which the poet had fled. The times seemed to him more out of joint than ever, and he withdrew into himself. Even his relations to the old friends were changed. Frau von Stein had not known of his flight to Italy until she received a letter from Rome; but he looked forward to her welcome on his return. The months of absence, however, the change he had undergone, and doubtless those lighter loves of which the Römische Elegien are the record, weakened the Weimar memories; if he left Weimar as Frau von Stein’s lover he returned only as her friend; and she naturally resented the change. Goethe, meanwhile, satisfied to continue the freer customs to which he had adapted himself in Rome, found a new mistress in Christiana Vulpius (1765–1816), the least interesting of all the women who attracted him. But Christiane gradually filled up a gap in the poet’s life; she gave him, quietly, unobtrusively, without making demands on him, the comforts of a home. She was not accepted by court society; it did not matter to her that even Goethe’s intimate friends ignored her; and she, who had suited the poet’s whim when he desired to shut himself off from all that might dim the recollection of Italy, became with the years an indispensable helpmate to him. On the birth in 1789 of his son, Goethe had some thought of legalizing his relations with Christiane, but this intention was not realized until 1806, when the invasion of Weimar by the French made him fear for both life and property.

The period of Goethe’s life which succeeded his return from Italy was a restless one: relieved of his state duties, he returned in 1790 to Venice, only to be disenchanted with the Italy he had loved so intensely a year or two before. A journey with the duke of Weimar to Breslau followed, and in 1792 he accompanied his master on that campaign against France which ended so ingloriously for the German arms at Valmy. In later years Goethe published his account both of this Campagne in Frankreich and of the Belagerung von Mainz, at which he was also present in 1793. His literary work naturally suffered under these distractions. Tasso, and the edition of the Schriften in which it was to appear, had still to be completed on his return from Italy; the Römische Elegien, perhaps the most Latin of all his works, were published in 1795, and the Venetianische Epigramme, the result of the second visit to Italy, in 1796. The French Revolution, in which all Europe was engrossed, was in Goethe’s eyes only another proof that the passing of the old régime meant the abrogation of all law and order, and he gave voice to his antagonism to the new democratic principles in the drama Der Grobskopf (1793), Der Bürgergeneral (1793), and in the unfinished fragments Die Aufregungen and Das Mädchen von Oberkirch. The spirited translation of the epic of Reinecke Fuchs (1794) he took up as a relief and an antidote to the social disruption of the time. Two new interests, however, strengthened the ties between Goethe and Weimar,—ties which the Italian journey had threatened to sever: his appointment in 1791 as director of the ducal theatre, a post which he occupied for twenty-two years, and his absorption in scientific studies. In 1790 he published his important Versuch, die Metamorphose der Pflanzen zu erklären, which was an even more fundamental achievement for the new science of comparative morphology
than his discovery some six years earlier of the existence of a formation in the human jaw-bone analogous to the intermaxillary bone in apes; and in 1791 and 1792 appeared two parts of his Beiträge zur Óptik.

Meanwhile, however, Goethe had again taken up the novel of Calypso which he had begun years before, with a view to finishing it and including it in the edition of his Neue Schriften (1792-1800). Wilhelm Meisters theatralische Sendung became Wilhelm Meisters Lehrjahre; the novel of purely theatrical interests was widened out to embrace the history of a young man's apprenticeship to life. The change of plan explains, although it may not excite, the formlessness and loose construction of the work, its extremes of realistic detail and poetic alliteration. A hero, who was probably originally intended to demonstrate the failure of the vaunting temperament when brought face to face with the problems of art, proved ill-adapted to demonstrate those precepts for the guidance of life with which the Lehrjahre closes; unstable of purpose, Wilhelm Meister is not so much an illustration of the author's life-philosophy as a lay-figure on which he demonstrates his views. Wilhelm Meister is a work of extraordinary variety, ranging from the commonplace realism of the troupe of strolling players to the poetic romanticism of Mignon and the harper; its flashes of intuitive criticism and its weighty apothegms add to its value as a Bildungroman in the best sense of that word. Of all Goethe's works, this exerted the most immediate and lasting influence on German literature; it served as a model for the best fiction of the next thirty years.

In completing Wilhelm Meister, Goethe found a sympathetic and encouraging critic in Schiller, to whom he owed in great measure his renewed interest in poetry. After years of tentative approaches on Schiller's part, years in which that poet concealed even from himself his desire for a friendly understanding with Goethe, the favourable moment arrived; it was in June 1794, when Schiller was seeking collaborators for his new periodical Die Horen; and his invitation addressed to Goethe was the beginning of a friendship which continued unbroken until the younger poet's death. The friendship of Goethe and Schiller, of which their correspondence is a priceless record, had its limitations; it was purely intellectual in character, a certain barrier of personal reserve being maintained to the last. But for the literary life of both poets the gain was inestimable. As far as actual work was concerned, Goethe went his own way as he had always been accustomed to do; but the mere fact that he devoted himself with this most patient passion to his to Schiller's stimulus. It was Schiller, too, who induced him to undertake those studies on the nature of epic and dramatic poetry which resulted in the epic of Hermann und Dorothea and the fragment of the Achilleis; without the friendship there would have been no Xenien and no ballads, and it was his younger friend's encouragement which induced Goethe to betake himself once more to the "mystic path" of Faust, and bring the first part of that drama to a conclusion.

Goethe's share in the Xenien (1795) may be briefly dismissed. This collection of dicta, written in collaboration with Schiller, was prompted by the indifference and anomie of contemporary criticism, and its disregard for what the two poets regarded as the higher interests of German poetry. The Xenien served as a retaliation on the critics, but the masterpieces which followed them proved in the long run much more effective weapons against the prevailing mediocrity. Prose works like the Unterhaltungen deutscher Ausgewanderten (1795) were unworthy of the poet's genius, and the translation of Benvenuto Cellini's Life (1796-1797) was only a translation. But in 1798 appeared Hermann und Dorothea. It is indeed remarkable—when we consider by how much re-

fection and theoretic discussion the composition of the poem was preceded and accompanied—that it should make upon the reader so simple and "naive" an impression; in this respect it is the triumph of an art that conceals art. Goethe has here taken a simple story of village life, mirrored in it the most pregnant ideas of his time, and presented it with a skill which may well be called Homeric; but he has discriminated with

the insight of genius between the Homeric method of reproducing the heroic life of primitive Greece and the same method as adapted to the commonplace happenings of 18th-century Germany. In this respect he was undoubtedly guided by a forerunner who has more right than he to the attribute "naive," by J. H. Voss, the author of Luise. Hardly less imposing in their calm, placid perfection are the poems with which, in friendly rivalry, Goethe seconded the more popular ballads of his friend; Der Zauberlehrling, Der Gott und die Bayadere, Die Braut von Korinth, Alexis und Dora, Der neue Faustus and Die schöne Müllerin—a cycle of poems in the style of the Volkslied—are among the masterpieces of Goethe's poetry. On the other hand, between the friendship with Schiller did not help him to add to his reputation as a dramatist. Die natürliche Tochter (1803), in which he began to embody his ideas of the Revolution on a wide canvas, proved impossible on the stage, and the remaining dramas, which were to have formed a trilogy, were never written. Goethe's classic principles, when applied to the swift, direct art of the theatre, were doomed to failure, and Die natürliche Tochter, notwithstanding its good theoretic intention, remains the most lifeless and shadowless of all his dramas. Even less in touch with the living present were the various private and festspiele, such as Polteaphon und Neuterpe (1800), Was wir bringen (1802), which in these years he composed for the Weimar theatre.

Goethe's classicism brought him into inevitable antagonism with the new Romantic movement which had been inaugurated in 1798 by the Alteuencum, edited by the brothers Schlegel. The sharpness of the conflict was, however, blunted by the fact that, without exception, the young Romantic writers looked up to Goethe as their master; they modelled their fiction on Wilhelm Meister; they regarded his lyrics as the high-water mark of German poetry. Goethe himself, however, felt that protest was necessary, if the insidious ideas propounded in works like Wackenroder's Herzensgeißelungen were not to do irreparable harm, by bringing back the confusion of the Sturm und Drang; and, as a rejoinder to the Romantic theories, Goethe, in conjunction with his friend Heinrich Meyer (1760-1832), published from 1798 to 1800 an art review, Die Propyläen. Again, in Wimckelnmann und seine Zeit (1803) Goethe vigorously defended the classical ideals of which Winckelmann had been the founder. But in the end he found himself more and more at variance with the spirit, indeed, of the publication in 1808 of the completed first part of Faust, a work which was accepted by contemporaries as a triumph of Romantic art. Faust is a patchwork of many colours. With the aid of the vast body of Faust literature which has sprung up in recent years, and the many new documents bearing on its history— above all, the so-called Urfaust, to which reference has already been made—we are able now to ascribe to their various periods the component parts of the work; it is possible to discriminate between the Sturm und Drang hero of the opening scenes and of the Gretchen tragedy—the contemporary of Götz and Clavigo—and the superimposed Faust of calmer moral and intellectual ideals—a Faust who corresponds to Hermann and Wilhelm Meister. In its original form the poem was the dramatization of a specific and individualized story; in the years of Goethe's friendship with Schiller it was extended to embody the higher strivings of 18th-century humanism; ultimately, as we shall see, it became, in the second part, a vast allegory of human life and activity. Thus the elements of which Faust is composed were even more difficult to blend than were those of Wilhelm Meister; but the very element of uniformity is one source of the transcendent fascination of the tragedy, and has made it in a peculiar degree the national poem of the German people, the mirror which reflects the national life and poetry from the outburst of Sturm und Drang to the well-weighed and tranquil classicism of Goethe's old age.

The third and final period of Goethe's long life may be said to have begun after Schiller's death. He never again lost touch with literature as he had done in the years which preceded his
friendship with Schiller; but he stood in no active or immediate connexion with the literary movement of his day. His life moved on comparatively uneventfully. Even the Napoleonic régime of 1806–1814 disturbed but little his equanimity. Goethe, the cosmopolitan Weltbürger of the 18th century, had himself no very intense feelings of patriotism, and, having seen Germany flourish as a group of small states under enlightened despotisms, he had little confidence in the dreams of 1813 who hoped to see the glories of Barbarossa’s empire revived. Napoleon, moreover, he regarded not as the scourge of Europe, but as the defender of civilization against the barbarism of the Slavs; and in the famous interview between the two men at Erfurt the poet’s admiration was reciprocated by the French conqueror. The great sympathy which Goethe entertained for France was one of the most important causes of young men who became the defenders of France. It was a kind of German nationalism which kindled young hearts from one end of Germany to the other; and when the national enthusiasm rose to its highest pitch, he buried himself in those optical and morphological studies, which, with increasing years, occupied more and more of his time and interest.

The works and events of the last twenty-five years of Goethe’s life may be briefly summarized. In 1805, as we have seen, he suffered an irreparable loss in the death of Schiller; in 1806, Christiane became his legal wife, and to the same year belongs the magnificent trial to his delight friend, *Die Wahlverwandtschaften.* Two new friendships about this time kindled in the poet something of the juvenile fire and passion of younger days. Bettina von Arnim came into personal touch with Goethe in 1807, and her *Briefwechsel Goethes mit einem Kinde* (published in 1835) is, in its mingling of truth and fiction, one of the most delightful products of the Romantic mind; but the episode was of less importance for Goethe’s life than Bettina would have us believe. On the other hand, his interest in Minna Herzlieb, foster-daughter of the publisher Frommann in Jena, was of a warmer nature, and has left its traces on his sonnets.

In 1808, as we have seen, appeared the first part of *Faust,* and in 1809 it was followed by *Die Wahlverwandtschaften.* The novel, hardly less than the drama, effected a change in the public attitude towards the poet. Since the beginning of the century the conviction had been growing ground that Goethe’s mission was accomplished, that the day of his leadership was over; but here were two works which, in the mind of his admirers, were re-established his ascendancy, but proved that the old poet was in sympathy with the movement of letters, and keenly alive to the change of ideas with which he had brought in its train. The intimate, psychological study of four minds, which forms the subject of *Die Wahlverwandtschaften,* was an essay in a new type of fiction, and pointed out the way for developments of the German novel after the stimulus of *Wilhelm Meister* had exhausted itself. Less important than *Die Wahlverwandtschaften* was *Pandora* (1810), the final product of Goethe’s classicism, and the most uncompromisingly classical and allegorical of all his works. And in 1810, too, appeared his treatise on *Farbenlehre.* In the following year the first volume of his autobiography was published under the title *Aus meinem Leben, Dichtung und Wahrheit.* The second and third volumes of this work followed in 1812 and 1814; the fourth, bringing the story of his life up to the close of the Frankfort period in 1833, after his death. Goethe felt, even late in life, too intimately bound up with Weimar to discuss in detail his early life there, and he shrank from carrying his biography beyond the year 1775. But a number of other publications—descriptions of travel, such as the *Italienische Reise* (1816–1817), the materials for a continuation of *Dichtung und Wahrheit* collected in *Tag- und Jahreshefte* (1826)—have also to be reckoned among the publications of his last years. The most valuable documents of his life. Meanwhile no less valuable biographical material was accumulating in his diaries, his voluminous correspondence and his conversations, as recorded by J. P. Eckermann, the chancellor Müller and F. Soret. Several periodical publications, *Über Kunst und Altertum* (1816–1832), *Zur Naturwissenschaft überhaupt* (1817–1824), *Zur Morphologie* (1817–1822), bear witness to the extraordinary breadth of Goethe’s interests in these years. Art, science, literature—little escaped his ken—and that not merely in Germany: English writers, Byron, Scott and Carlyle, Italians like Manzoni, French scientists and poets, could all depend on friendly words of the relation and encouragement from Weimar.

In *Westästlicher Druck* (1819), a collection of lyrics—matchless in form and even more concentrated in expression than those of earlier days—which were suggested by a German translation of Hafiz, Goethe had another surprise in store for his contemporaries. And, again, it was an actual passion—that for Marianne von Willemer, whom he met in 1814 and 1815—which rekindled in him the lyric fire. Meanwhile the years were thinning the ranks of Weimar society: Wieland, the last of Goethe’s greater literary contemporaries, died in 1813, his wife in 1816, Charlotte von Stein in 1817, her son Wieland in 1820. Goethe retired himself from the direction of the theatre in 1817, and meant for him a break with the literary life of the day. In 1822 a passion for a young girl, Ulrike von Levetzow, whom he met at Marienbad, inspired the fine *Trilogie der Leidenschaft,* and between 1821 and 1829 appeared the long-expected and long-promised continuation of *Wilhelm Meister, Wilhelm Meisters Wanderjahre.* The latter work, however, was a disappointment: perhaps it could not have been otherwise. Goethe had lost the thread of his romance and it was difficult for him to resume it. Problems of the relation of the individual to society and industrial questions were to have formed the theme of the *Wanderjahre*; but since the French Revolution these problems had themselves entered on a new phase and demanded a method of treatment which it was not easy for the old poet to learn. Thus his intentions were only partially carried out, and the volumes were filled out by irrelevant stories, which had been written at widely different periods.

But the crowning achievement of Goethe’s literary life was the completion of *Faust.* The poet had accompanied him from early manhood to the end and was the repository for the fullest “confession” of his life; it is the poetic epitome of his experience.

The second part is, in form, far removed from the impressive realism of the *Urfaust.* It is a phantasmagory; a drama the actors in which are not creatures of flesh and blood, but the shadows of an unreal world of allegory. The lover of Gretchin had, as far as poetic continuity is concerned, disappeared with the close of the first part. In the second part it is virtually a new Faust who, at the hands of a new Mephistopheles, goes out into a world that is not ours. Yet behind these unconvincing shadows of an impossible creation lie the facts of his life, the last “Wanderjahre” of *Wilhelm Meister,* the fantastic creation of the Homunculus, the noble Helena episode and the impressive mystery-scene of the close, where the centenarian Faust finally triumphs over the powers of evil, there lies a philosophy of life, a ripe wisdom born of experience, such as no European poet had given to the world since the Renaissance. *Faust* has been well called the “divine comedy” of 18th-century humanism.

The second part of *Faust* forms a worthy close to the life of Germany’s greatest man of letters, who died in Weimar on the 22nd of March 1832. He was the last of those universal minds which have been able to compass all domains of human activity and knowledge; for he stood on the brink of an era of rapidly expanding knowledge which has made for ever impossible the universality of interest and sympathy which distinguished him. As a poet, his fame has undergone many vicissitudes since his death, ranging from the indifference of the “Young German” school to the enthusiastic admiration of the closing decades of the 19th century—an enthusiasm to which we owe the Weimar *Goethe-Gesellschaft* (founded in 1859) and a vast literature dealing with the poet. The ideal of Germany’s greatest poet and the master of her classical literature has never been seriously put in question. The intrinsic value of his poetic work, regarded apart from his personality, is smaller in proportion to its bulk than is the case with many lesser German poets and with the greatest poets of other literatures. But Goethe was a type of literary man hitherto unrepresented among the leading writers of the world’s literature; he was a poet whose supreme greatness lay in his subjectivity. Only a small fraction
of Goethe's work was written in an objective and detached manner, and sprang from what might be called a conscious artistic impulse of the later years, and the other part is the immediate reflex of his feelings and experiences.

It is as a lyric poet that Goethe's supremacy is least likely to be challenged; he has given his nation, whose highest literary expression has in all ages been essentially lyric, its greatest songs. No other German poet has succeeded in attuning feeling, sentiment and thought so perfectly to the music of words as he; none has expressed so fully that spirituality in which the quintessence of German lyricism lies. Goethe's dramas, on the other hand, have not, in the eyes of his nation, succeeded in holding the same sway. Schiller's; but the reason is rather the cause Goethe, from what might be called a wilful obstinacy, refused to be bound by the conventions of the theatre, than because he was deficient in the cunning of the dramatist. For, as an interpreter of human character in the drama, Goethe is without a rival among modern poets, and there is not one of his plays that does not contain a few scenes or characters which bear indubitable testimony to his mastery. Faust is Germany's most national drama, and it remains perhaps for the theatre of the future to prove itself capable of popularizing this psychological masterpiece like Tasso and Iphigenie. It is as a novelist that Goethe has suffered most by the lapse of time. The Sorrows of Werther no longer moves us to tears, and even Wilhelm Meister and Die Wahlverwandtschaften require more understanding for the conditions under which they were written than do Faust or Egmont. Goethe could fill his prose with rich wisdom, but he was only the perfect artist in verse.

Little attention is nowadays paid to Goethe's work in other fields, work which he himself in some cases prized more highly than his poetry. It is only as an illustration of his many-sidedness and his manifold activity that we now turn to his work as a statesman, as a theatre-director, as a practical political economist. His art-criticism is symptomatic of a phase of European taste which tried in vain to check the growing individualism of Romanticism. His scientific studies and discoveries awaken only an historical interest. We marvel at the obstinacy with which he, with inadequate mathematical knowledge, opposed the Newtonian theory of light and colour; and at his championship of "Vulcanism," the theory of aqueous origin, as opposed to "Neptunism," that of ignous origin of the earth's crust.

If far-reaching importance was, on the other hand, his foreshadowing of the Darwinian theory in his works on the metaphysics of plants and on animal morphology. Indeed, the deduction to be drawn from Goethe's contributions to botany and anatomy is that he, as no other of his contemporaries, possessed that type of scientific mind which, in the 19th century, has made for progress; he was Darwin's predecessor by virtue of his enunciation of what has now become one of the commonplaces of natural science—organic evolution. Modern, too, was the outlook of the aging poet on the changing social conditions of the age, wonderfully sympathetic his attitude towards modern industry, which steam was just beginning to establish on a new basis, and towards modern democracy. The Europe of his later years was very different from the idyllic and enlightened autocracy of the 18th century, in which he had spent his first years and to which he had devoted his energies; yet Goethe was at home in it.

From the philosophic movement, in which Schiller and the Romanticists were so deeply involved, Goethe stood apart. Comparatively early in life he had found in Spinoza the philosopher who responded to his needs; Spinoza taught him to see in nature the "living garment of God," and more he did not seek or need to know. As a convinced realist he took his standpoint on nature and experience, and could afford to look on objectively at the controversies of the metaphysicians. Kant he by no means ignored, and under Schiller's guidance he learned much from him; but of the younger thinkers, only Schelling, whose mystic philosophy and development of Spinoza's ideas, touched a sympathetic chord in his nature. As a moralist and a guide to the conduct of life—a aspect of Goethe's work which Carlyle, viewing him through the coloured glasses of Fichtean idealism, emphasized and interpreted in always justly—Goethe was a powerful force on German life in years of political and intellectual depression. It is difficult even still to get beyond the maxims of practical wisdom he scattered so liberally through his writings, the lessons to be learned from Meister and Faust, or even that calm, optimistic fatalism which never deserted Goethe, and was so completely justified by the tenor of his life. If the philosophy of Spinoza provided the poet with a religion which made individual creeds and dogmas unnecessary and impossible, so Leibnitz's doctrine of pre-determination supplied the foundations for his faith in the divine mission of human life.

This many-sided activity is a tribute to the greatness of Goethe's mind and personality; we may regard him merely as the embodiment of his particular age, or as a poet "for all time"; but with one opinion all who have felt the power of Goethe's genius are in agreement—the opinion which was condensed in Napoleon's often cited words, uttered after the meeting at Erfurt: Weil ein Mensch! Of all modern men, Goethe is the most universal type of genius. It is the full, rich humanity of his spirit and personality in the art he created, not his obtrusion, or the definite pronouncements of the thinker or the teacher—that constitutes his claim to a place in the front rank of men of letters. His life was his greatest work.

BIBLIOGRAPHY. —(a) Collected Works, Diaries, Correspondence, Conversations. The following authorized editions of "Goethe's writings appeared in the poet's lifetime: Schriften (8 vols., Leipzig, 1796-1800); Die Neuen Schriften (6 vols., Berlin, 1792-1800); Werke (13 vols., Stuttgart, 1806-1810); Werke (20 vols., Stuttgart, 1815-1819); to which six volumes were added in 1820-1822; Werke (19 vols., Ausgabe leichte). 8th ed. (1901); vols., Stuttgart, 1827-1850). Goethe's Nachgelassene Werke appeared as a continuation of this edition in 15 volumes (Stuttgart, 1832-1834), to which five volumes were added in 1842. These were followed by several editions of Goethe's Werke, and a popular edition by Cottaperce of Stuttgart. The first critical edition with notes was published by Hempel, Berlin, in thirty-six volumes, 1868-1879; that in Kürschner's Deutsche Nationalliteratur, vols. 32-117 (1882-1897) is also important. In 1887 the monumental Weimar edition, which is now approaching completion, began to appear; it is divided into four sections: I. Werke, c. 50 vols.; II. Naturwissenschaftliche Werke (12 vols.); III. Tagebucher (15 vols.); IV. Briefe (145 vols.). Of other recent editions the most noteworthy are: Sämtliche Werke (Jubiläums-Ausgabe), edited by E. von der Helten (40 vols., Stuttgart, 1902 ff.); Werke, edited by K. Heinemann (30 vols., Leipzig, 1905); and the cheap and popular edition of L. Geiger (44 vols., Leipzig, 1901). There are also innumerable editions of selected works; reference need only be made here to the useful collection of the early writings and letters published by S. T. Coleridge, with an introduction by Bernal (Berlin, 1875); a French translation of Goethe's Études complètes, by J. Porchat, appeared in 9 vols., at Paris, in 1895. There is an 18-volume English translation (in 60 parts) in Reclam's Universalbibliothek, 1904; English translation by A. D. Coleridge, 1887; Bettina von Arnim, Goethes Briefwechsel mit einer Kinde (1835; 4th ed., 1890; English translation, 1884); Briefwechsel von Goethe und Herzog von Waldeck (6 vols., 1861); Briefwechsel von Goethe und bis Frau von Stein, edited by A. Scholl (1848-1851; 3rd ed. by J. Wahlen, 1899-1900); Briefwechsel zwischen Goethe und K. F. von Reinhard (1850); Briefwechsel zwischen Goethe und Schiller (1851); Briefwechsel zwischen Goethe und Staatsrat Schultze (1853); Briefwechsel des Herrs. Karl August mit Goethe (2 vols., 1863); Briefwechsel zwischen Goethe und Kaspar Graf von Sternberg (1866); Briefwechsel zwischen Goethe und Herrn C. von Vrba (1871); Briefwechsel mit den Gebrüdern von Humboldt, edited by F. T. Bratianne (1872-1876); Goethe und Carl Heinrich Hoffmann (2 vols., 1880); Briefwechsel zwischen der Familie der Gebrüder Hoffmann und Schiller, edited by C. Schüttelkopf and O. Walzel (2 vols., 1898-1900); Goethe und Leopold von Ranke, edited by H. Funck (1901); Goethe und Österreich, edited by A. Sauer (2 vols., 1902-1903). Besides the correspondence with Schiller and Zelter, Bohn's library contains a translation of Early and Miscellaneous
Goethe's Descendants.—Goethe's only son, August, born on the 25th of December 1780 at Weimar, married in 1817 Ottilee von Pogwisch (1769–1782), who had come as a child to Weimar with her mother (née Countess Henckel von Donnersmarck). The marriage was a very unhappy one, the husband having no qualities that could appeal to a woman who, whatever the censorious might say of her moral character, was distinguished by her beauty of person and the charm of her manner. August von Goethe, whose sole distinction was his birth and his position as grand-ducal chamberlain, died in Italy, on the 27th of October 1830, leaving three children: Walther Wolfgang, born on April 9, 1818, died on April 15, 1883; Wolfgang Maximilian, born on September 18, 1820, died on January 20, 1883; Alma, born on October 22, 1827, died on September 20, 1844.

Of Walther von Goethe little need be said. In youth he had musical ambitions, studied under Mendelssohn and Weingartner, and was a successful opera composer. He also published a few songs of no great merit, and had at his death no more than the reputation among his friends of a kindly and accomplished man.

Wolfgang or, as he was familiarly called, Wolf von Goethe, was by far the more gifted of the two brothers, and his gloomy destiny by so much the more tragic. A sensitive and highly imaginative boy, he was the favourite of his grandfather, who made him his constant companion. This fact, instead of being to the boy's advantage, was to prove his bane. The exalted position of the Goethen, which cast its inevitable shadow upon the child's intellectual health, and a brain well fitted to do excellent work in the world was ruined by the effort to live up to an impossible ideal. To maintain himself on the same height as his grandfather, and to make the name of Goethe illustrious in his descendants also, was Wolfgang's ambition; and his incapacity to realize this, very soon borne upon him, paralyzed the following: W. Scherer, Aus Goethes Frühzeit (1879); R. Weisfels, Goethe in Sturm und Drang, vol. i. (1894); W. Willich, Quellenstudien zu Goethes Göts von Berlichingen (1874); J. Baechtold, Goethes Göts von Berlichingen in dreifacher Gestalt (1882); J. W. Apel, Goethes Göts von Berlichingen in ihrer Entwicklung (1890); R. Richard, Goethes Frankreichreise 1820 und sein Reisebericht (1888); E. T. Richard, Gesellschaftsleben in Paris (1899); L. Sirn, Goethe und die Romantik (1888).

More special treaties dealing with individual works are:

1. W. Scherer, Aus Goethes Frühzeit (1879); R. Weisfels, Goethe in Sturm und Drang, vol. i. (1894); W. Willich, Quellenstudien zu Goethes Göts von Berlichingen (1874); J. Baechtold, Goethes Göts von Berlichingen in dreifacher Gestalt (1882); J. W. Apel, Goethes Göts von Berlichingen in ihrer Entwicklung (1890); R. Richard, Goethes Frankreichreise 1820 und sein Reisebericht (1888); E. T. Richard, Gesellschaftsleben in Paris (1899); L. Sirn, Goethe und die Romantik (1888).
GOETZ

189

to the public and the Goethe archives to research, that the charge has almost universally come to be regarded as proven. It is true that the house was closed and access to the archives only very sparingly allowed until Baron Walther's death in 1885. But the reason for this was not, as Herr Max Hecker rather absurdly suggests, Wolfgang's jealousy of his grandfather's opposition to him, but only the very simple and natural. From cause or another, principally Ottillie von Goethe's extravagance, the family was in very straitened circumstances; and the brothers, being thoroughly unbusinesslike, believed themselves to be poorer than they really were. They closed the Goethehaus and the archives, because to have opened them would have needed an army of attendants. If they desire any blame it is for the pride, natural to their rank and their generation, which prevented them from charging an entrance fee, an expedient which would not only have made it possible for them to give access to the house and collections, but would have enabled them to save the fabric from falling into the lamentable state of disrepair in which it was found after their death. In any case, the accusation is ungenerous. With an almost exaggerated Pietism Goethe's descendants preserved his house untouched, at great inconvenience to themselves, and left it, with all its treasures intact, to the nation. Had they been the selfish misers they are sometimes painted, they could have realized a fortune by selling its contents.

Wolf Goethe (Weimar, 1889) is a sympathetic appreciation by Otto M. von Hentig, formerly president of the Lutheran consistory in Hanover. See also Jenny v. Gerstenberg, Ottillie von Goethe und ihre Söhne Walther und Wolf (Stuttgart, 1901), and the article on Max Hecker in Allgemeine deutsche Biographie, Bd. 49, Nachräge (Leipzig, 1904).

GOETZ, HERMANN (1840-1876), German musical composer, was born at Königsberg in Prussia, on the 19th of December 1840, and began his regular musical studies at the comparatively advanced age of seventeen. He entered the music-school of Professor Stern at Berlin, and studied composition chiefly under Ulrich and Hans von Bülow. In 1863 he was appointed organist at Winterthur in Switzerland, where he lived in obscurity for a number of years, occupying himself with composition during his leisure hours. One of his works was an opera, The Taming of the Shrew, the libretto skillfully adapted from Shakespeare's play. After much delay it was produced at Mannheim (in October 1874), and its success was as instantaneous as it has up to the present proved lasting. It rapidly made the round of the great German theatres, and spread its composer's fame over all the land. But Goetz did not live to enjoy this happy result for long. In December 1876 he died at Zürich from overwork. A second opera, Francesco da Rimini, on which he was engaged, remained a fragment; but it was finished according to his directions, and was performed for the first time at Mannheim a few months after the composer's death on the 4th of December 1876. Besides his dramatic work, Goetz also wrote various compositions for chamber-music, of which a trio (Op. 1) and a quintet (Op. 16) have been given with great success at the London Monday Popular Concerts. Still more important is the Symphony in F. As a composer of comic opera Goetz lacks the sprightliness and artistic savoir faire so rarely found amongst Germanic nations. His was essentially a serious nature, and passion and pathos were to him more congenial than humour. The more serious sides of the subject are therefore insisted upon more successfully than Katherine's ravings and Petuchio's eccentricities. There are, however, very graceful passages, e.g. the singing lesson Bajo, which reveals the poet's genuine lover.

Goetz's style, although influenced by Wagner and other masters, shows signs of a distinct individuality. The design of his music is essentially of a polyphonic character, and the working out and interweaving of his themes betrays the musician of high scholarship. But breadth and beautiful flow of melody also were his,
as is seen in the symphony, and perhaps still more in the quintet for piano forte and strings above referred to. The most important of Goffe's posthumous works are a setting of the 137th Psalm for soprano solo, chorus and orchestra, a "Spring" overture (Op. 1), and a pianoforte sonata for four hands (Op. 17).

**Goffe** (or Gough), **William** (fl. 1642–1660), English parliamentarian, son of Stephen Goffe, puritan rector of Stammer in Essex, began life as an apprentice to a London salter, a zealous parliamentarian, but on the outbreak of the civil war he joined the army and became captain in Colonel Harley's regiment of the new model in 1645. He was imprisoned in 1643 for his share in the petition to give the control of the militia to the parliament. In the marriage with Frances, daughter of Oliver Cromwell, he became connected with Oliver Cromwell's family and one of his most faithful followers. He was a member of the deputation which on the 6th of July 1647 brought up the charge against the eleven members. He was active in bringing the king to trial and signed the death warrant. In 1649 he received the honorary degree of M.A. at Oxford. He distinguished himself at Dunbar, commanding a regiment there and at Worcester. He assisted in the expulsion of Barebone's parliament in 1653, took an active part in the suppression of Pett's rebellion in July 1654, and in October 1655 was appointed major-general for Berkshire. Meanwhile he had been elected member for Yarmouth in the parliament of 1654 and for Hampshire in that of 1656. He supported the proposal to bestow a royal title upon Cromwell, who greatly esteemed him, was included in the newly-created House of Lords, obtained Lambert's place as major-general of the Foot, and was even thought of as a fit successor to Cromwell. As a member of the committee of nine appointed in June 1658 on public affairs, he was witness to the protector's appointment of Richard Cromwell as his successor. He supported the latter during his brief tenure of power and his fall involved his own loss of influence. In November 1660 he took part in the futile mission sent by the army to Monk in Scotland, and at the Restoration escaped with his father-in-law General Edward Whalley to Massachusetts. Goffe's political aims appear not to have gone much beyond fighting "to pull down Charles and set up Oliver"; and he was no doubt a man of deep religious feeling, who acted throughout according to a strict sense of duty as he conceived it. He was destined to pass the rest of his life in exile, separated from his wife and children, dying, it is supposed, about 1679.

**Goffen**, to give a fluttered or crimped appearance to anything, particularly to linen or lace frills or trimmings by means of heated irons of a special shape, called goffering-irons or tongs. "Goffering," or the French term gaufrage, is also used of the wavy or crimped edge in certain forms of porcelain, and also of the stamped or embossed decorations on the edges of the binding of books. The French word gaufré, from which the English form is adapted, means a thin cake marked with a pattern like a honeycomb, a "wafer" which is etymologically the same word. 

Wafret appears in the phrase au fer à wafret, an iron for baking cakes on (quotations of 1433 in J. B. Roquefort's Glossaire de la langue romane). The word is Teutonic, cf. Dutch wafel, Ger. Wafel, a form seen in "waffe," the name given to the well-known batter-cakes of America. The "wafer" was so called from its likeness to a honeycomb, Wabe, ultimately derived from the root wab-, to weave, the cells of the comb appearing to be woven together.

**Gog** (possibly connected with the Gentile Gaguya, "of the land of Gag," used in Amarna Letters i. 38, as a synonym for "barbarian," or with Ass. Gagu, a ruler of the land of Saki, N. of Assyria, or with Gygges, Ass. Gugu, a king of Lydia), a Hebrew name found in Ezek. xxxviii. -xxxix. and in Rev. xx., and denoting an antithecocratic power that is to manifest itself in the world immediately before the final dispensation. In the later passage, Gog and Magog are spoken of as co-ordinate; in the earlier, Gog is given as the name of the person or people and Magog as that of the land of origin. Magog is perhaps a contracted form of Mat-gog, mat being the common Assyrian word for "land." The passages are, however, intimately related and both depend upon Gen. x. 2, though here Magog alone is mentioned. He is the second "son" of Japheth, and the order of the names here and in Ezekiel xxxviii-xxxix. indicates the solidarity between Cappadocia and Media, i.e. in Armenia. According to Josephus, who is followed by Jerome, the Scythians were primarily intended by this designation; and this plausible opinion has been generally followed. The name Σκυθα, it is to be observed, however, is often but a vague word for any or all of the numerous and but partially known tribes of the north; and any attempt to assign a more definite locality to Magog can only be very hesitatingly made. According to some, the Scythians about the Palus Maeotis are meant; according to others, the Meceanians and the so-called Kryps, the inhabitants of the northern and eastern parts of Armenia. The imagery employed in Ezekiel's prophetic description was no doubt suggested by the Scythian invasion which about the time of Josiah, 630 B.C., had devastated Asia (Herodotus i. 104-106; Jer. iv. 3-13). Following on this description, Gog figures largely in Jewish and Mahomedan as well as in Christian eschatology. In the district of Astrakhan a legend is still to be met with, to the effect that Gog and Magog were two great races, which Alexander the Great subdued and banished to the utmost recesses of the world. In another, whether in connection with this or not, there was a mountain of twelve trumpets blown by the winds, but whence they are destined ultimately to make their escape and destroy the world.

The legends that attach themselves to the gigantic effigies (dating from 1708 and replacing those destroyed in the Great Fire) of Gog and Magog in Guildhall, London, are connected only remotely, if at all, with the biblical notices. According to the Recueil des histoires de Troye, Gog and Magog were the survivors of a race of giants descended from the thirty-three wicked daughters of Diodietian; after their brethren had been slain by Brutus and his companions, Gog and Magog were brought to London (Troy-novant) and compelled to officiate as porters at the gate of the royal palace. It is known that effigies similar to the present existed in London as early as the time of Henry V.; but when this legend began to attach to them is uncertain. They may be compared with the giant images formerly kept at Antwerp (Antigomes) and Douai (Gayant). According to Geoffrey of Monmouth (Chronicles, i. 16), Göemot or Göünágot (either corrupted from or corrupted into Gog and Magog') was a giant who, along with his brother Corineus, tyrannized in the western part of England until slain by foreign invaders.

**Goga**, or Gogha, a town of British India in Ahmedabad district, Bombay, 193 m. N.W. of Bombay. Pop. (1901) 4798. About 2 m. east of the town is an excellent anchorage, in some measure sheltered by the island of Piram, which lies still farther east. The natives of this place are reckoned the best sailors in India; and ships touching here may procure water and supplies, or repair damages. The anchorage is a safe refuge during the south-west monsoon, the bottom being a bed of mud and the water always smooth. Goga has lost its commercial importance and has steadily declined in population and trade since the time of the American Civil War, when it was an important cotton-market.

**Gogol, Nikolai Vasilievich** (1809-1852), Russian novelist, was born in the province of Poltava, in South Russia, on the 31st of March 1809. Educated at the Niezhin gymnasium, he there started a manuscript periodical, The Star, and wrote several pieces including a tragedy, The Brigands. Having completed his course at Niezhin, he went in 1829 to St. Petersburg, where he tried the stage but failed. Next year he obtained a clerkship in the department of appanages, but he soon gave it up. In literature, however, he found his true vocation. In 1829 he published anonymously a poem called Italy, and, under the pseudonym of V. Alof, an idyll, Hans Kuchel Garlen, which he had written while still at Niezhin. The idyll was so ridiculed by a reviewer that its author bought up all the copies he could secure, and burnt them in a room which he hired for the purpose at an inn. Gogol then fell back upon South Russian popular literature, and especially the tales of Cossackdom on which his boyish fancy had been nurtured, his father having occupied the
post of "regimental secretary," one of the honorary officials in the Zaporogian Cossack forces.

In 1830 he published in a periodical the first of the stories which appeared next year under the title of *Evenings in a Farm near Dibanka* by Rudy Panko. This work, containing a series of attractive pictures of that Little-Russian life which lends itself to romance more readily than does the monotony of "Great-Russian" existence, immediately obtained a great success, its light and colour, its freshness and originality being hailed with enthusiasm by the principal writers of the day in Russia. Whereupon Gogol planned, not only a history of Little-Russia, but also one of the middle ages, to be completed in eight or nine volumes. This plan he did not carry out, though it led to his being appointed to a professorship in the university of St Petersburg, a post in which he met with small success and which he resigned in 1835. Meanwhile he had published his *Arabesques*, a collection of essays and stories; his *Taras Bulba*, the chief of the Cossack Tales translated into English by George Tolstoy; and a number of novelettes, which mark his transition from the romantic to the realistic school of fiction, such as the admirable sketch of the tranquil life led in a quiet country house by two kindly specimens of Old-world Gentefolk, or the description of the petty miseries endured by an ill-paid clerk in a government office, the great object of whose life is to secure the "cloak" from which his story takes its name. To the same period belongs his celebrated comedy, the *Revizor*, or government inspector. His aim in writing it was to drag into light "all that was bad in Russia," and to hold it up to contempt. And he succeeded in rendering contemptible and ludicrous the official life of Russia, the corruption universally prevailing throughout the civil service, the alternate arrogance and servility of men in office. The plot of the comedy is very simple. A traveller who arrives with an empty purse at a provincial town is taken for an inspector whose arrival is awaited with fear, and he receives all the attentions and bribes which are meant to propitiate the dreaded investigator of abuses. The play appeared on the stage in the spring of 1836, and achieved a full success, in spite of the opposition attempted by the official classes whose malpractices it exposed. The aim which Gogol had in view when writing the *Revizor* he afterwards fully attained in his great novel, *Mertviya Dushi*, or Dead Souls, the first part of which appeared in 1832. The hero of the story is an adventurer who goes about Russia making fictitious purchases of "dead souls," i.e. of serfs who have died since the last census, with the view of pledging his imaginary property to the government. But his adventures are merely an excuse for drawing a series of pictures, of an unfavourable kind, of Russian provincial life, and of introducing on the scene a number of types of Russian society. Of the force and truth with which these delineations are executed the universal consent of Russian critics in their favour may be taken as a measure. From the French version of the story a general idea of its merits may be formed, and some knowledge of its plot and its principal characters may be gathered from the English adaptation published in 1854, as an original work, under the title of *Home Life in Russia*. But no one can fully appreciate Gogol's merits as a humorist who is not intimate with the language in which he wrote as well as with the society which he depicted.

In 1836 Gogol for the first time went abroad. Subsequently he spent a considerable amount of time out of Russia, chiefly in Italy, where much of his *Dead Souls* was written. His residence there, especially at Rome, made a deep impression on his mind, which, during his later years, turned towards mysticism. The last works which he published, his *Confession and Correspondence with Friends*, offer a painful contrast to the light, bright, vivid, realistic, humorous writings which had gained and have retained in Russia the recognition of the popular in his native land. Asceticism and mystical exaltation had told upon his nervous system, and its feeble condition showed itself in his literary compositions. In 1848 he made a pilgrimage to Jerusalem, and on his return settled down at Moscow, where he died on the 3rd of March 1852.

**GOGRA—GOITRE**

**GOGRA**, or gohra, a river of northern India. It is an important tributary of the Ganges, bringing down to the plains more water than the Ganges itself. It rises in Tibet near Lake Manasarowar, not far from the sources of the Brahmaputra and the Indus, passes through Nepal where it is known as the Kaurila, and after entering British territory becomes the most important waterway in the United Provinces. It joins the Ganges at Chapra after a course of 600 m. Its tributary, the Rapti, also has considerable commercial importance. The Gofra has the alternative name of Saraju, and in its lower course is also known as the Deoha.

**GOHIER, LOUIS JEROME** (1740-1830), French politician, was born at Semblancay (Indre-et-Loire) on the 27th of February 1746, the son of a notary. He was called to the bar at Rennes, and practised there until he was sent to represent the town in the states-general. In the Legislative Assembly he represented Ille-et-Vilaine. He took a prominent part in the deliberations; he protested against the exaction of a new oath from priests (Nov. 22, 1791), and demanded the sequestration of the emigrants' property (Feb. 7, 1792). He was minister of justice from March 1793 to April 1794, and in June 1799 he succeeded Treilhard in the Directory, where he represented the republican interest. His wife was intimate with Josephine Bonaparte, and when Bonaparte suddenly returned from Egypt in October 1799 he offered his resignation, which was accepted, and he was appointed president of the Directory, and tried in vain to gain him over. After the coup d'état of the 18th Brumaire (Nov. 9, 1799), he refused to abdicate his functions, and sought out Bonaparte at the Tuileries "to save the republic," as he boldly expressed it. He was escorted to the Luxembourg, and on his release he retired to his estate at Eaubonne. In 1802 Napoleon made him consul-general at Amsterdam, and on the union of the Netherlands with France he was offered a similar post in the United States. His health did not permit of his taking up a new appointment, and he died at Eaubonne on the 29th of May 1830.

His *Mémoires d'un vétéran trépassé de la Révolution* was published in 1824, his report on the papers of the civil list preparatory to the trial of Louis XVI. is printed in *Le Proces de Louis XVI* (Paris, an III) and elsewhere, while others appear in the *Moniteur*.

**GÖHRDE**, a forest of Germany, in the Prussian province of Hanover, immediately W. of the Elbe, between Wittenberg and Lüneburg. It has an area of about 85 sq. m. and is famous for its oaks, beeches and game preserves. It is memorable for the victory gained here, on the 16th of September 1813, by the allies, under Wallmoden, over the French forces commanded by Poërcher. The hunting-box situated in the forest was built in 1689 and was restored by Ernest Augustus, King of Hanover. It is known to history on account of the constitution of Göhrde, promulgated here in 1710.

**GOITO**, a village of Lombardy, Italy, in the province of Mantua, from which it is 11 m. N.W., on the road to Brescia. Pop. (village) 737; (commune) 5712. It is situated on the right bank of the Mincio near the bridge. Its position has given it a certain military importance in various campaigns and it has been fortified as a bridge-head. The Piedmontese forces won two actions (8th of April and 30th of May 1848) over the Austrians here.

**GOITRE** (from Lat. *guttur*, the throat; synonyms, Bronchocele, Derbyshire Neck), a term applied to a swelling in the front of the neck caused by enlargement of the thyroid gland. This structure, which lies between the skin and the anterior surface of the windpipe, and in health is not large enough to give rise to any external prominence (except in the pictures of certain artists), is liable to variations in size, more especially in females, a temporary enlargement of the gland being not uncommon at the cataminal periods, as well as during pregnancy. In goitre the swelling is conspicuous and is not only unsightly but may occasion much discomfort from its pressure upon the windpipe and other important parts of the neck. J. L. Alibert recorded cases of
goitre where the tumour hung down over the breast, or reached as low as the middle of the thigh.

Goitre usually appears in early life, often from the eighth to the twelfth year; its growth is at first slow, but after several years of comparative quiescence a sudden increase is apt to occur. In the earlier stages the condition of the gland is simply an enlargement of its constituent parts, which retain their normal soft consistence; but in the course of time other changes supervene, and it may become cystic, or acquire hardness from increase of fibrous tissue or from calcareous deposits. Occasionally the enlargement is uniform, but more commonly one of the lobes, generally the right, is greatly increased. In rare instances the disease is limited to the isthmus which connects the two lobes of the gland. The growth is unattended with pain, and is not inconsistent with good health.

Goitre is a marked example of an endemic disease. There are few parts of the world where it is not found prevailing in certain localities, these being for the most part valleys and elevated plains in mountainous districts (see Cretinism). The malady is generally ascribed to the use of drinking water impregnated with the salts of lime and magnesia, in which ingredients the water of goitrous districts abounds. But in localities not far removed from those in which the disease is prevalent, and where the water is of the same chemical composition, the disease may be entirely unknown. The disease may be the result of a combination of causes, among which local telluric or malarial influences concur with those of the drinking water. Goitre is sometimes cured by removal of the individual from the district where it prevails, and it is apt to be acquired by previously healthy persons who settle in goitrous localities; and it is only in such places that the disease exhibits hereditary tendencies.

In the early stages, change of air, especially to the seaside, is desirable, and small doses of iron and of iodine should be given; if this fails small doses of thyroid extract should be tried. If palliative measures prove unsuccessful, operation must be undertaken for the removal of one lateral lobe and the isthmus of the tumour. This may be done under chloroform or after the subcutaneous injection of cocaine. If chloroform is used, it must be given very sparingly, as the breathing is apt to become seriously embarrassed during the operation. After the successful performance of the operation great improvement takes place, the remaining part of the gland slowly decreasing in size. The whole of the gland must not be removed during the operation, lest the strange disease known as Myxoedema should be produced (see Metabolic Diseases).

In exophthalmic goitre the bronchocele is but one of three phenomena, which together constitute the disease, viz. palpitation of the heart, enlargement of the thyroid gland, and protrusion of the eyeballs. This group of symptoms is known by the name of "Graves's disease" or "von Basedow's disease"—the physicians by whom the malady was originally described. Although occasionally observed in men, this affection occurs chiefly in females, and in comparatively early life. It is generally preceded by impoverishment of blood, and by nervous or hysterical disorders, and it is occasionally seen in cases of organic heart disease. It has been suddenly developed as the effect of fright or of violent emotion. The first symptom is usually the palpitation of the heart, which is aggravated by slight exertion, and may be so severe as not only to shake the whole frame but even to be audible at some distance. A throbbing is felt throughout the body, and many of the larger blood-vessels are, like the heart, seen to pulsate strongly. The enlargement of the thyroid is gradual, and rarely increases to any great size, thus differing from the commoner form of goitre. The enlarged gland is of soft consistence, and communicates a thrill to the touch from its dilated and pulsating blood-vessels. Accompanying the goitre a remarkable change is observed in the eyes, which attract attention by their prominence, and by the startled expression thus given to the countenance. In extreme cases the eyes protrude from their sockets to such a degree that the eyelids cannot be closed, and injury may thus arise to the constantly exposed eyeballs. Apart from such risk, however, the vision is rarely affected. It occasionally happens that in undoubted cases of the disease one or other of the three above-named phenomena is absent, generally the goitre or the exophthalmos. The palpitation of the heart is the most constant symptom. Sleeplessness, irritability, disorders of digestion, diarrhoea and uterine discharges, are frequent accompaniments. It is a serious disease and, if unchecked, may end fatally. Some cases are improved by general hygienic measures, others by electric treatment, or by the administration of animal extracts or of sera. Some cases, on the other hand, may be considered suitable for operative treatment.

**GOKAK**

A town of British India, in the Belgaum district of Bombay, 8 m. from a station on the Southern Mahratta railway. Population (1871) 9815. It contains old temples with inscriptions, and is known for a special industry of modelled toys. About 4 m. N.W. are the Gokak Falls, where the Ghatprabha throws itself over a precipice 170 ft. high. Close by, the water has been impounded for a large reservoir, which supplies not only irrigation but also motive power for a cotton-mill employing 2000 hands.

**GOKCHA,** (Gók-Cha; Armenian Sevageh; ancient Haora-vagh), the largest lake of Russian Transcaucasia, in the government of Erivan, in 40° 10' 40" 38° N. and 45° 1' 10" 45° E. Its altitude is 6345 ft., it is of triangular shape, and measures 19 m. by 1510 m. at its greatest length, 12 m. at an average width of 45 m., its greatest depth being 25 m., and its maximum depth 69 fathoms. Its area is 560 m. is surrounded by barren mountains of volcanic origin, 12,000 ft. high. Its outflow is the Zanga, a left bank tributary of the Aras (Araxes); it never freezes, and its level undergoes periodic oscillations. It contains four species of Salmonidae, and two of Cyprinidae, which are only met with in the drainage area of this lake. A lava island in the middle is crowned by an Armenian monastery.

**GOLCONDA,** a fortress and ruined city of India, in the Nizam's Dominions, 5 m. W. of Hyderabad city. In former times Golconda was the capital of a large and powerful kingdom of the Deccan, ruled by the Kutch Shahi dynasty which was founded in 1512 by a Turkoman adventurer on the downfall of the Bahmani dynasty, but the city was subdued by Aurangzeb in 1687, and annexed to the Delhi empire. The fortress of Golconda, situated on a rocky ridge of granite, is extensive, and contains many enclosures. It is strong and in good repair, but is commanded by the summits of the enormous and massive mausoleum of the ancient kings about 600 yds. distant. These buildings, which are now the chief characteristics of the place, form a vast group, situated in an arid, rocky desert. They have suffered considerably from the ravages of time, but more from the hand of man, and nothing but the great solidity of their walls has preserved them from utter ruin. These tombs were erected at a great expense, some of them being said to have cost as much as $150,000. Golconda fort is now used as the Nizam's treasury, and also as the state prison. Golconda has given its name in English literature to the diamonds which were found in other parts of the dominions of the Kutch Shahi dynasty, not near Golconda itself.

**GOLD** [symbol Au, atomic weight 197.2; (H = 1), 197.2; (O = 16)], a metallic chemical element, valued from the earliest ages on account of the permanency of its colour and lustre. Gold ornaments of great variety and elaborate workmanship have been discovered on sites belonging to the earliest known civilizations, Minoan, Egyptian, Assyrian, Etruscan (see Jewelry, Plate, Egypt, Crete, Aegean Civilization, Numismatics), and in ancient literature gold is the universal symbol of the highest purity and value (cf. passages in the Old Testament, e.g. Ps. xix. 10). More to be desired are they than gold, yea, than much fine gold (1). With regard to the history of the metallurgy of gold, it may be mentioned that, according to Pliny, mercury was employed in his time both as a means of separating the precious metals and for the purposes of gilding. Vitruvius also gives a detailed account of the means of recovering gold, by amalgamation, from cloth into which it had been woven.

**Physical Properties.—**Gold has a characteristic yellow colour, which is, however, notably affected by small quantities of other metals; thus the tint is sensibly lowered by small quantities of silver, and heightened by copper. When the gold is finely
GOLD

by Berzelius, who deduced the value 195-7 (H = 1) from the amount of mercury necessary to precipitate it from the chloride, and 195-2 from the ratio between gold and potassium chloride in potassium aurichloride, KAuCl₄. Later determinations made by Sir T. E. Thorpe and A. F. Thoart-Kruss and J. W. Mallet. Thorpe and Laurie converted potassium auribromide into a mixture of metallic gold and potassium bromide by careful heating. The relation of the gold to the potassium bromide, as well as the amounts of silver and silver bromide which are equivalent to the potassium bromide, were determined. The mean value thus adduced was 195-86. Kruss worked with the same salt, and obtained the value 195-65; while Mallet, by analyses of gold chloride and bromide, and potassium auribromide, obtained the value 195-77.

Occurrence and Distribution.—Gold is found in nature chiefly in the metallic state, i.e. as "native gold," and less frequently in combination with tellurium, lead and silver. These are the only certain examples of natural combinations of the metal, the minute, though economically valuable, quantity often found in pyrites and other minerals being formed in suspension. The native metal crystallizes in the cubic system, the octahedron being the commonest form, but other and complex combinations have been observed. Owing to the softness of the metal, large crystals are rarely well defined, the points being commonly rounded. In the irregular crystalline aggregates branching and moss-like forms are most common, and in Transylvania thin plates or sheets with diagonal structures are found. More characteristic, however, than the crystallized forms are the irregular forms, which, when large, are known as "nuggets" or "pebbles," and which in pieces below 1 oz. to 1 oz. weight as gold, and the smaller as gold dust proper. Except in the larger nuggets, which may be more or less angular, or at times even masses of crystals, with or without associated quartz or other rock, gold is generally found bean-shaped or in some other flattened form, the smallest particles being scales of scarcely appreciable thickness, which, from their small bulk as compared with their surface, subside very slowly when suspended in water, and are therefore readily carried away by a rapid current. These form the "float gold" of the miners. The electrical conductivity of gold is very similar to that of silver, as indicated by the specific gravity.

Of the minerals containing gold the most important are sylvinite or graphic tellurium (Ag, Au) Te₄, with 24 to 26 %; calaverite, AuTe₂, with 42 %; nayyagite or foliate tellurium (Pb, Au)₄Sb₂(S, Te)₄, with 5 to 9 % of gold; pechblende (Fe, Au)₄S₄, with 5 to 8 % of gold. These are confined to the "alluvial" gold fields. The direct types of reef gold deposits may be distinguished: (1) Gold may occur disseminated through metalliciferous veins, generally in the form of auriferous quartz reefs, or in more particulate form, as auriferous conglomerates, which are the primary sources of native gold. (2) More common are the auriferous quartz reefs—veins or masses of quartz containing gold in flakes visible to the naked eye, or so finely divided as to be invisible. (3) The "telluriter" forms are particularly characteristic of the Northern Cape Province. South Africa, consists of a quartzite conglomerate throughout which gold is very finely disseminated. (4) The siliceous sinter at
Mount Morgan, Queensland, which is obviously associated with hydrothermal action, is also gold-bearing. The genesis of the last three types of deposit is generally assigned to the simultaneous percolation of solutions of gold and silica, the auriferous solution being formed during the disintegration of the gold-bearing metalliferous veins. But there is much uncertainty as to the mechanism of the process; some authors hold that the soluble chloride is first formed, while others postulate the intervention of a soluble aurate.

In the alluvial deposits the associated minerals are chiefly those of great density and hardness, such as platinum, chromium, magnetic and brown iron ores, diamond, ruby and sapphire, zircon, topaz, garnet, &c. which represent the more durable original constituents of the rocks whose disintegration has furnished the detritus.

Statistics of Gold Production.—The supply of gold, and also its relation to the supply of silver, has, among civilized nations, always been of paramount importance in the economic questions concerning money (see MONEY and BIMETALLISM); in this article a summary of the modern gold-producing areas will be given, and for further details reference should be made to the articles on the localities named. The chief sources of the European supply during the middle ages were the mines of Saxony and Austria, while Spain also contributed. The supplies from Mexico and Brazil were important during the 16th and 17th centuries. Russia became prominent in 1823, and for fourteen years contributed the bulk of the supply. The United States (California) after 1848, and Australia after 1851, were responsible for enormous increases in the total production, which has been subsequently enhanced by discoveries in Canada, South Africa, India, China and other countries.

The average annual world's production for certain periods from 1801 to 1886 in ounces is given in Table I. The average production of the five years 1881-1885 was the smallest since the Australian and Californian mines began to be worked in 1848-1849; the minimum 4,014,588 oz., occurred in 1882. It was not until after 1885 that the annual output of the world began to expand. Of the total production in 1876, 5,016,488 oz., almost the whole was derived from the United States, Australasia and India. Since then the proportion furnished by these countries has been greatly lowered by the supplies from South Africa, Canada, India and China. The increase of production has not been uniform, the greatest part having occurred most notably since 1895. Among the regions not previously important as gold-producers which now contribute to the annual output, the most remarkable are the goldfields of South Africa (Transvaal and Rhodesia, the former of which were discovered in 1888), India likewise has been added to the list, its active production having begun at about the same time as that of South Africa. The average annual production of India for the period 1886 to 1899 inclusive was 698,208, and its present annual production averages about 500,000. The total of about £2,000,000, obtained almost wholly from the free-mining quartz veins of the Colar goldfields in Mysore, southern India. In 1900 the output was valued at £1,801,804, in 1905 at £2,450,536, and in 1908 at £2,720,000. India, too, assumed an important rank, having contributed in 1900 £5,853,300; but the output has since steadily declined to £1,973,000 in 1908. The great increase during the few years preceding 1899 was due to the development of the goldfields of the North-Western Territory, especially British Columbia. From the district of Yukon (Klondike, &c.) £2,000,000 was obtained in 1899, wholly from alluvial workings, but the progress made since has been slower than was expected by sanguine people. It is, however, probable that the North-Western Territory will continue to yield gold in important quantities for some time to come.

The output of the United States increased from £7,050,000 in 1881 to £16,085,687 in 1900, £17,016,000 in 1905, and to £20,605,000 in 1908. This increase was chiefly due to the exploitation of new goldfields. The fall in the price of silver stimulated the discovery and development of gold deposits, and many states formerly regarded as characteristically silver districts have become important as gold producers. Colorado is a case in point, its output having increased from about £600,000 in 1880 to £6,500,000 in 1905, £5,150,000 in 1906 and £4,000,000 in 1907. Some-what more than one-half of the Colorado gold is obtained from the Cripple Creek district. Other states also showed a largely augmented product. On the other hand, the output of California, which was producing over £3,000,000 per annum in 1876, has fallen off, the average annual output from 1876 to 1900 being £2,800,000; in 1905 the yield was £3,839,000. This decrease was largely caused by the practical suspension for many years of the hydraulic mining operations, in preparation for which millions of dollars had been expended in deep tunnels, flumes, &c., and the active continuance of which might have been expected to yield some £2,000,000 of gold annually. This interruption, due to the practical prohibition of the industry by the United States courts, on the ground that it was injurious, through the deposit of tailings, agricultural lands and navigable streams, was lessened, though not entirely removed, by compromises and regulations which permit, under certain restrictions, the renewed exploitation of the ancient river-beds by the hydraulic method.

On the other hand, the progressive reduction of mining and metallurgical costs effected by improved transportation and a new air and the use of high explosives, compressed air, electric-power transmission, &c., resulted in California (as elsewhere) in a notable revival of deep mining. This was especially the case on the "Mother Lode," where highly promising results were obtained. Not only is vein-material formerly regarded as unremunerative now extracted at a profit, but in many instances increased gold-values have been encountered below zones of relative barrenness, and operators have been encouraged to make costly preparations for really deep mining — more than 1000 ft. below the surface. The gold product of California, therefore, may be fairly expected to maintain itself, and, indeed, to show an advance. Alaska appeared in the list of gold-producing countries in 1886, and gradually increased its annual output until 1897, when the country attracted much attention with a production valued at over £500,000; the opening up of new workings has increased this figure immensely, from about £1,400,000 in 1901 to £3,000,500 in 1905. The Alaska gold was derived almost wholly from the low grade quartz mines of Douglas Island prior to 1899, but in that year an important deposit was discovered at Cape Nome on the north-western coast. The result of a few months' working during that year was more than £500,000 of gold, and a very much larger annual output may reasonably be anticipated in the future; in 1905 it was about £1,000,000. The gold occurs in alluvial deposits designated as gulch-, bar-, beach-, tundra- and bench-places. The tundra is a coastal plain, swampy and covered with under- and underlaid by gravel. The most interesting and, thus far, the most productive are the beach deposits, similar to those on the coast of Northern California. These occur in a strip of comparatively fine gravel and sand, 150 yds. wide, extending along the shore. The gold is found in stratified layers, with "ruby" and black sand. The "ruby" sand consists chiefly of fine garnets and magnetites, with a few rose-quartz grains. Further exploration of the interior will probably result in the discovery of additional gold districts.

Mexico, from a gold production of £2,000,000 in 1891, advanced to about £1,881,800 in 1900 and to about £3,221,000 in 1905. Of this increase, a considerable part was derived from gold-quartz mining, though much was also obtained as a by-product in the working of the ores of other metals. The product of Colombia, Venezuela, the Guianas, Brazil, Uruguay, Argentina, Chile, Bolivia, Peru and Ecuador amounted in 1900 to £4,812,000 and to £2,046,000 in 1905. In 1876 Australasia produced £7,364,000, of which Victoria contributed £3,984,000. The annual output of Victoria declined
GOLD

The gold production of Russia has been remarkably constant, averaging $4,890,262 per annum; the gold is derived chiefly from placer workings in Siberia.

The gold production of China was estimated for 1899 at $1,078,427. and for 1900 at $860,000; it increased in 1901 to about $1,700,000, to fall to $2,400,000 in 1905; in 1906 and 1907 it recovered to about $1,000,000.

</table>

Alloys.—Gold forms alloys with most metals, and of these many are of great importance in the arts. The alloy amalgam—so readily formed with mercury—deserves to be considered a powerful agent for extracting the precious metal. With 10% of gold present the amalgam is fluid, and with 12-5% paste, while with 13% it consists of yellowish-white crystals. Gold readily alloys with silver and copper to form substances in use from remote times for money, jewelry and plate. Other metals which find application in the metallurgy of gold by virtue of their property of extracting the gold as an alloy are lead, which combines very readily when molten, and which is separated by cooling and copper, which is separated from the gold by solution in acids or by electrolysis; molten lead also extracts gold from the copper-gold alloys. The value of gold in these alloys, for (1) as "fitness," i.e. the amount of gold in 1000 parts of alloy; (2) as "carats," i.e. the amount of gold in 24 parts of alloy. Thus, pure gold is 1000 "fine" or 24 carat. In England the following standards are used for gold; 22, 21, 18 and 15 carat; these latter being 916, 900, 833, and 625, corresponding to 9, 12, 15, 18 and 22 carats, the alloying metals being silver and copper in varying proportions. In France three alloys of the following standards are used for jewelry; 750, 490 and 750. A greenish alloy used by goldsmiths contains 70% of silver and 30% of gold. "Blue gold" is stated to contain 75% of gold and 25% of iron. The Japanese use for ornament an alloy of gold and silver, the standard of which varies from 350 to 500, the colour of the precious metal being developed by "pickling" in a mixture of plum-juice, vinegar and copper sulphate. They may be said to possess a series of bronzes, in which gold and silver replace copper, all these alloys having characteristic and pleasing tints of colour, and a wonderful range of tint. The common alloy, Shi-ya-ku-Do, contains 70% of copper and 30% of gold when used as for air, it becomes coated with a fine black patina, and its colour may be drawn of any quality, but it is usual to add 5 to 9 dwts. of copper to the pound. The "solders" used for red gold contain 1 part of copper and 5 of gold; for light gold, 1 part of copper, 1 of silver and 4 of gold. Gold and Silver.—Electrum is a natural alloy of gold and silver. Matthiessen observed that the density of alloys, the composition of which varies from AuAg to AuAg, is greater than that calculated from the densities of the constituent metals, but the alloys are harder, more fusible and more sonorous than pure gold. The alloys of the formulae AuAg, AuAg, AuAg, and AuAg are perfectly fusible, and have been worked by theurgists. The alloys containing more than 80% of silver deposit on cooling the alloy AuAg, little gold remaining in the mother liquor.

Gold and Zinc.—When present in small quantities zinc renders gold
GOLD

brittle, but it may be added to gold in large quantities without destroying its characteristic properties. This is possible because the peculiar physical and chemical behavior of gold is due to the fact that it is a solid solution of two elements, copper and zinc. The triple alloy of gold, copper, and zinc, which contains 5.8% of the latter, is perfectly ductile. The alloy of 11 parts gold and 1 part of zinc is, however, stated to be brittle.

This is shown by the fact that gold alloyed with 14 parts of tin is sufficiently ductile to be rolled and stamped into coin, provided the metal is not annealed at a high temperature. The alloys of tin and gold are not preferred for most of the applications of gold because they have a tendency to form a brittle intermetallic compound with tin. This intermetallic compound is in solid solution with tin; thus the alloy AuSn has a density of 19-243, instead of 19-828 indicated by calculation. Matthiessen and Bose obtained large crystals of the alloy AuSn4, having the character of a brownie with a brownie with a dark brown tint.

Gold and Iron.—Hatchett found that the alloy of 11 parts gold and 1 part of iron is easily rolled without annealing. In these proportions the density of the alloy is less than the mean of its constituents.

Gold and Palladium.—These metals are stated to be rolled to gold in all proportions. According to Chenevix, the alloy composed of equal parts of gold and palladium is of a bright golden color, and has the specific gravity 11-06. The alloy of 4 parts of gold and 1 part of palladium is white, hard and ductile. Graham showed that a wire of palladium alloyed with 24 to 25 parts of gold does not exhibit the remarkable extraction which, in pure palladium, attains its loss of occluded hydrogen.

Gold and Platinum.—Clarke states that the alloy of equal parts of gold and platinum is of a yellow color, and has the specific gravity 11-07.

Gold and Rhodium.—Gold alloyed with 4th or 9th of rhodium is, according to Wollaston, very ductile, insufible, and of the color of gold.

Gold and Iridium.—Small quantities of iridium do not destroy the ductility of gold, but increase its specific gravity. This is probably caused by the metal being disseminated through the mass, and not, as it falls to the bottom of the crucible in which the gold is fused.

Gold and Nickel.—Eleven parts of gold and 1 of nickel yield an alloy of a deep golden yellow.

Gold and Cobalt.—Eleven parts of gold and 1 of cobalt form a brittle alloy of a dull yellow color.

Compounds.—Aurous oxide, AuO, is obtained by cautiously adding potash to a solution of aurous bromide, or by boiling mixed solutions of auric chloride and mercuric nitrate. It forms a dark-violet precipitate which dries to a greyish-violet powder. When finely divided, it is a white powder and forms an indigo-colored solution with a brownish fluorescence of colloidal auric oxide; it is insoluble in hot water. This oxide is slightly basic. A solution of auric oxide is decomposed into aurous oxide when heated to about 250° or on exposure to light. When a concentrated solution of auric chloride is treated with caustic potash, a brown precipitate of auric hydrate, Au(OH)3, is obtained, which, on heating, loses water to form auric hydrate, Au(OH)2, and auric oxide, AuO. It functions chiefly as an acidic oxide, being less basic than aluminium oxide, and forming no soluble oxy-salts. It dissolves in alkalis to form well-defined crystalline salts; potassium aurate, KAuO3·H2O, is very soluble in water, and is used in electrogilding. With concentrated ammonium auric oxide forms a black, highly explosive compound of the composition AuNH3·3H2O, mentioned above; this is not a general formula, as the oxygen is to be Au(NH3)3·3H2O, but it may be an ammine of the formula [Au(NH3)2(OH)2]2+OH. Other oxides, e.g., AuO2H, have been described.

Aurous chloride, AuCl, is obtained as a lemon-yellow, amorphous powder by treating a solution of gold in hydrochloric acid with potassium chloride. It begins to decompose into gold and chlorine at 185°, the decomposition being complete at 230°; water decomposes it into gold and auric chloride, AuOCl, or gold trichloride, AuCl3, is a dark ruby-red or redish-brown, crystalline, deliquescent powder obtained by dissolving the metal in aqua regia. It is also obtained by carefully evaporating a solution of the metal in chloroform water. The gold chloride of commerce, which is used in photography, is really hydrochloric, chlorauric or aurichloric acid, HAuCl4·3H2O, and is obtained in long yellow needles by crystallizing the acid chlorides. Chlorauric acid may be obtained from mercuric chloride and auric chlorides, are known. The potassium salt is obtained by crystallizing equivalent quantities of potassium and auric chlorides. Light-yellow monoclinic needles of 2KauCl3·H2O are deposited from warm, strongly acid solutions, and transparent rhombohedral tablets of KauCl3·2H2O from neutral solutions. By crystallizing an aqueous solution, red crystals of AuCl3·2H2O are obtained. Auric chloride decomposes into gold and chlorauric acid by the action of any organic bases—amines, alkali- hydrates, &c., to form characteristic compounds. Gold dichloride, probably Au2Cl6, is aurous aurichloruric acid, is said to be obtained as a dark-red mass by heating finely divided gold to 140° in the presence of water and chlorine. It is an amphoteric substance and decomposes into aurous and auric chlorides. The bromides and iodides resemble the chlorides. Aurous bromide, AuBr, is a yellow-green powder obtained by heating the tribromide AuBr3, which boils at 361°, with aurous bromide, AuBr3, forms reddish-black or scarlet-red leafy crystals, which decompose on exposure to light, form a brown solution, and combines with bromides to form bromaurates corresponding to the chloraurates. Aurous iodide, AuI, is a light-yellow, soluble substance obtained by the action of iodine on adding potassium iodide to auric acid; auric iodide, AiI4, is formed as a dark-green powder at the same time, but it readily decomposes to aurous iodide and iodine. Aurous iodide is also obtained by the action of iodine on aurous oxide, Au2O3, which is precipitated upon gold with iodine. The iodurates correspond to the chloro- and bromaurates; the potassium salt, KAuI4, forms highly lustrous, intensely black, four-sided prisms.

Aurous cyanide, AuCN, forms yellow, microscopic, hexagonal tablets in water in the presence of ammonia. This is obtained by precipitating gold from a solution of sodium cyanide, NaAuCN, with cyanogen. This salt is used for precipitating a solution of gold in water in the presence of air, a reaction utilized in the MacArthur-Forrest process of gold extraction (see below). Auric cyanide, Au(CN)2, is not certainly known; its double salts, however, have been frequently described. Auric cyanate, AuOCN, is used as a mordant in dyeing wool, tablets by crystallizing concentrated solutions of auric chloride and potassium cyanide. The acid, auric cyanic acid, 2H2Au(CN)2·3H2O, is formed by bringing gold into solution is mentioned by Stahl in his Observations Chymico-Physico-Medicae; he there remarks that Moses probably destroyed the golden calf by burning it with sulphur and alkali (Ex. xxxii. 20). Aurous cyanate, AuOCN·H2O, is formed when gold is treated with sodium cyanide, and, when dry, is treated with water, the resulting mixture is called aurichloric acid, Au(CN)2·H2O, which is treated with dry sulphuric acid at 10°. It is very unstable, decomposing into gold and sulphur at 200°.

Oxy-salts of gold are almost unknown, but the sulphide and thiosulphate form double salts. Thus by adding acid sodium sulphite to, or by passing sulphur dioxide into, a solution of sodium aurate, the salt 3Na2SO3·Au2SO3·3H2O is obtained, which, when precipitated from its aqueous solution by alcohol, forms a purple powder, appearing yellow or green by reflected light. Sodium aurithiosulphate, 3Na2SO3·Au2SO3·4H2O, forms colourless needles; it is obtained in the direct action of sodium thiosulphate on the gold in the presence of an oxidizing agent, or by the addition of a dilute solution of auric chloride to a sodium thiosulphate solution.

Mining and Metalurgy

The various deposits of gold may be divided into two classes—"veins" and "placer." The vein mining of gold does not greatly differ from that of similar deposits of metals (see MINERAL DEPOSITS). In the placer or alluvial deposits, the precious metal is found usually in a water-worn condition imbedded in earthy matter, and the method of working all such deposits is based on the disintegration of the earthy matter by the action of a stream of water, which washes away the lighter portions and leaves the denser gold. In alluvial deposits the richest ground is usually found in contact with the "bed rock" and, when the covering gravel is very thick, or, as sometimes by distance, when the older gravel is covered with a flow of basalt, regular mining by shafts and levels, as in what are known as tunnel-claims, may be required to reach the auriferous ground.

The extraction of gold may be effected by several methods; we may distinguish the following leading types:

1. By simple washing, i.e. dressing auriferous sands, gravels, &c.;

2. By amalgamation, i.e. forming a gold amalgam, afterwards removing the mercury by distillation;

3. By chlorination, i.e. forming the soluble gold chloride and then precipitating the metal;

4. By the cyanide process, i.e. dissolving the gold in potassium cyanide solution, and then precipitating the metal;

5. Electrolytically, generally applied to the solutions obtained in processes (3) and (4).

1. Extraction of Gold by Washing.—In the early days of gold-washing in California and Australia, when rich alluvial deposits were common at the surface, the most simple appliances sufficed. The gold was usually characterized as "yellow dust" and "purple dust" or "tin," with sloping sides about 13 or 14 in. in diameter. The pan, about two-thirds filled with the "pay dirt" to be washed, was covered with gravel or pebbles having been removed by hand, gyra try motion is given to the pan by a combination of shaking and twisting movements

"
with water in a
puddling machine," which was used, especially in
Australia, when the earthy matters are tenacious and water scarce.
The machine frequently resembles a brickmaker's wash-mill, and is
worked by horse or steam power.
In workings on a larger scale, where the supply of water is abundant,
as in California, sluices were generally employed. They are shallow
troughs about 12 ft. long, about 1 6 to 20 in. wide and I ft. in depth.
The troughs taper slightly so that they can be joined in series, the

of boards, whose dimensions depend chiefly on the size of the planks
available, is set up on the higher part of the ground at one side of the
claim to be worked, upon trestles or piers of rough stone-work, at such
an inclination that the stream may carry off all but the largest stones,
which are kept back by a grating of boards about 2 in. apart. The
gravel is dug by hand and thrown in at the upper end, the stones
kept back being removed at intervals by two men with four-pronged
steel forks. The floor of the sluice is laid with riffles made of strips
of wood 2 in. square laid parallel to the direction of the current, and
at other points with boards having transverse notches filled with
mercury. These were known originally as Hungarian riffles.
In larger plant the upper ends of the sluices are often cut in rock
or lined with stone blocks, the grating stopping the larger stones

these are shallow wooden tanks, 50 sq. yds. and upwards in area,
which are placed somewhat below the main sluice, and communicate
with it above and below, the entry being protected by a grating so
that only the finer material is admitted. These are paved with stone
blocks or lined with mercury riffles, so that from the greatly reduced
velocity of flow, due to the sudden increase of surface, the finer
particles of gold may collect. In order to save finely divided gold,
amalgamated copper plates are sometimes placed in a nearly level
position, at a considerable distance from the head of the sluice, the
gold which is retained in it being removed from time to time. Sluices
are often made double, and they are usually cleaned up that is,
the deposit rich in gold is removed from them once a week.

mills.

Hydraulic mining has for the most part been confined to the country
of its invention, California, and the western territories of America,
where the conditions favourable for its use are more fully developed
than elsewhere notably the presence of thick banks of gravel that
cannot be utilized by other methods, and abundance of water, even
though considerable work may be required at times to make it available.
The general conditions to be observed in such workings
may be briefly stated "as follows: (l) The whole of the auriferous
bed rock," must be removed, that is, no
gravel, down to the

socket joint, so that the direction of the jet may be varied through
considerable angles by simply moving a handle. The material of
the bank being loosened by blasting and the cutting action of the
water, crumbles into holes, and the superincumbent mass, often
with large trees and stones, falls into the lower ground. The
stream, laden with stones and gravel, passes into the sluices, where
the gold is recovered in the manner already described.
Under the
most advantageous conditions the loss of gold may be estimated at
15 or 20%, the amount recovered representing a value of about
two shillings per ton of gravel treated. The loss of mercury is
about the same, from 5 to 6 cwt. being in constant use per mile of
sluice.

In working auriferous river-beds, dredges have been used with
considerable success in certain parts of New Zealand and on the
Pacific slope in America.
The dredges used in California are almost
exclusively of the endless-chain bucket or steam-shovel pattern.
Some dredges have a capacity under favourable conditions of over
2000 cub. yds. of gravel daily. The gravel is excavated as in the
ordinary form of endless-chain bucket dredge and dumped on to the
deck of the dredge. It then passes through screens and grizzlies
to retain the coarse gravel, the finer material passing on to sluice
boxes provided with riffles, supplied with mercury. There are
belt conveyers for discharging the gravel and tailings at the end of the

vessel remote from the buckets.
is pumped from the river; as much as 2000 gallons per minute is
used on the larger dredges.
The dressing or mechanical preparation of vein stuff containing gold
is generally similar to that of other ores (see ORE-DRESSING), except
that the precious metal should be removed from the waste substances
as quickly as possible, even although other minerals of value that are
subsequently recovered may be present. In all cases the quartz
or other vein stuff must be reduced to a very fine powder as a preliminary to further operations. This may be done in several ways,
e.g. either ( I ) by the Mexican crusher or arrastra, in which the grinding
is effected upon a bed of stone, over which heavy blocks of stone
attached to cross arms are dragged by the rotation of the arms about
a central spindle, or (2) by the Chilean mill or trapiche, also known
as the edge-runner, where the grinding stones roll upon the floor,
at the same time turning about a central upright contrivances
which are mainly used for the preparation of silver ores; but
by far the largest proportion of the gold quartz of California,
Australia and Africa is reduced by (3) the stamp mill, which is similar
in principle to that used in Europe for the preparation of tin and other
ores.

The stamp mill was first used in California, and its use has since
spread over the whole world. In the mills of the Californian type the
stamp is a cylindrical iron pestle faced with a chilled cast iron shoe,
removable so that it can be renewed when necessary, attached to
a round iron rod or lifter, the whole weighing from 600 to 900 ft;
stamps weighing 1320 ft are in use in the Transvaal. The lift is
effected by cams acting on the under surface of tappets, and formed
by cylindrical boxes keyed on to the stems of the lifter about onefourth of their length from the top. As, however, the cams, unlike
those of European stamp mills, are placed to one side of the stamp, the
latter is not only lifted but turned partly round on its own axis, whereby the shoes are worn down uniformly. The height of lift may be
between 4 and 18 in., and the number of blows from 30 to over 100
per minute. The stamps are usually arranged in batteries of five;
the order of working is usually I, 4, 2, 5, 3, but other arrangements,

and I, 5, 2, 4, 3, are common. The stuff, previously
broken to about 2-in. lumps in a rock-breaker, is fed in through an

GOLD

At Schemnitz, Kerpenye, Kreuzberg and other localities in Hungary, quartz vein stuff containing a little gold, partly free and partly associated with pyrites and galena, is, after stamping in mills, similar to the gold of the gold-lead ores, rotated through the so-called "Hungarian gold mill" or "quick-mill." This consists of a cast-iron pan having a shallow cylindrical bottom holding mercury, in which a wooden muller, near a rotary motion imparted to it by a variety of wooden blades, is rotated. A rotating motion of the blades, with water between the blade and pan, and with several projecting blades, is made to revolve by gearing wheels. The stuff from the stamps is conveyed to the middle of the muller, and is distributed over the mercury. The water, which conveys the subsluice materials is guided by the blades to the circumference and are discharged, usually into a second similar mill, and subsequently pass over blanket tables, i.e., boards covered with clothes, burlap, etc. The gold is finally cleaned on shaking tables, and the amalgamation process is completed.

Lazaro, an improved Hungarian mill, while the Piccard is of the same type. In the Knox and Boss mills, which are also employed for the amalgamation of silver ores, the grinding is effected between flat horizontal surfaces instead of conical or curved surfaces as in the previous process.

One of the greatest difficulties in the treatment of gold by amalgamation, and more particularly in the treatment of pyrites, arises from the so-called "flowing" or "flouring" of the mercury. Particles of mercury, on coming in contact with the bright metallic surfaces, are no longer capable of coalescing with or taking up other metals. Of the numerous remedies proposed the most efficacious is perhaps sodium amalgam. It is evident that sodium amalgamation is not found to the extent that sodium solution is found on the surface of the gold when it is associated with sulphur, arsenic, bismuth, antimony or tellurium. Henry Wurtz in America (1866) and Sir WilliamCrookes in England (1870) independently found that, by the addition of a small quantity of sodium to the mercury, the objection is much facilitated. It is also stated that sodium prevents both the "sickening" and the "flouring" of the mercury, which is produced by certain associated minerals or the addition of potassium cyanide has been suggested to assist the amalgamation and prevent "flouring," but Skey has shown that its use is attended with loss of gold.

Refining by the Almagam.—The amalgam is first pressed in wetted canvas or burlap in order to remove excess of mercury. Lumps of the solid amalgam, about 2 in. in diameter, are introduced into an iron vessel provided with an iron tube that leads into a condenser containing water. The distillation is then effected by heating to dull redness. The amalgam yields about 30 to 40% of gold. Horizontal cylindrical retorts, holding from 200 to 1,000 lb of amalgam, are used in the larger Californian mills. Retorts are being used in the smaller mills. The bullion left in the retorts is then blended in lead crucibles, with the addition of small quantities of suitable fluxes, e.g., nitric, sodium carbonate, and variable quantities of mercuric and other solutions of mercury by fusion, except as an incident in their treatment for other metals, is very rarely practiced. It was at one time proposed to treat the concentrated black oxide of gold by washing it with water to make it a "black niter", as an iron ore, by smelting it with charcoal for auriferous pig-iron, the latter metal possessing the property of dissolving gold in considerable quantity. By subsequent treatment with sulphuric acid the gold could be recovered. Experiments on this point were made by Aosnes in 1835, but they have never been followed in practice.

Gold in galena or other lead ores is invariably recovered in the refining or treatment of the lead and silver obtained. Pyritic ores containing copper are treated by methods analogous to those of the copper smelter. In Colorado the pyritic ores containing gold and silver in association with copper are smelted in reverberatory furnaces for lead, which, when desilvered by Ziegler's method leaves a residue containing 20 or 30 oz. of gold per ton. This is smelted with rich gold ores, notably those containing tellurium, for white metal (cuprous gold) and by a process of preliminary calcination analogous to that of selecting in copper smelting. "bottoms" or impure copper are obtained in which practically all the gold is concentrated. By continuing the treatment of these in the ordinary way of refining, poling and granulating, all the foreign matters other than gold, copper and silver are removed, and by exposing the granulated metal to a high oxidizing heat for a considerable time the copper may be completely oxidized while the process is not entirely destructive of the gold. Cupric oxide renders the copper soluble in water as sulphate, and the final residue contains only gold and silver, which is parted or refined in the ordinary way. The gold so obtained, being a "granular gold," and the latter into oxide and sulphate, is also used at Oker in the Harz.

Extraction by Means of Aqueous Solutions.—Many processes have been suggested in which the gold of auriferous deposits is converted into products soluble in water, from which solutions the gold may be precipitated. Of these processes, two only are of special importance, viz., the chlorination or Plattner process, in which the metal is converted into the chloride, and the cyanide or MacArthur-Forrest process, in which it is converted into potassium auricyanide.

(5) Chlorination or Plattner Process.—In this process moistened gold ores are treated with chlorine gas, the resulting gold chloride dissolved in water, and the gold recovered by treatment with sodium hydrosulphite. In its general form, the process is as follows: A mixture of charcoal, sulphurised hydrogen or otherwise. The process originated in 1848 with C. F. Plattner, who suggested that the residues from certain mines at Reichenstein, in Silesia, should be treated with chlorine gas in order to separate the auriferous matter from the gangue. It must be noticed, however, that Percy independently made the same discovery, and stated his results at the meeting of the British Association (at Sheffield) arranged in 1851. The process was patented in 1852. The process was introduced in 1858 by Deeten at Grass Valley, California, where the waste minerals, principally pyrites from tailings, had been worked for a considerable time by amalgamation. Gold and silver are generally amalgamated, and the tailings and slimes, after concentration, are precipitated by means of hydrocyanic acid. The three stages in the process are to be distinguished: (i) calcination, to convert all the metals into gold and silver, into oxides, which are unacted upon by chlorine; (ii) chlorinating the gold and lixiviating the product; (iii) precipitating the gold.

The calcination, or roasting, is conducted at a low temperature in some form of reverberatory furnace. Salt is added in the roasting to convert any lime, magnesia or lead which may be present, into the corresponding chlorides. The auric chloride is, however, decomposed by the elevated and is then filtered off as a mass or black oxide, which is then readily attacked by the chlorine gas. The high volatility of gold in the presence of certain metals must also be considered. According to Plattner, the losses of gold in the roasting of the total gold present in cuprous ores according to the temperature and duration of calcination. The roasted mineral, slightly moistened, is introduced into a vat made of stone ware or piched planks, and furnished with a double bottom. Chlorine, generally prepared by the interaction of pyroslat and sulphuric acid, is fed from a suitable generator beneath the false bottom, and rises through the moistened ore, which is thus converted into a soluble chloride, which is afterwards removed by washing with water. Both fixed and rotating vats are employed, the chlorination proceeding more rapidly in the latter case. The residue, after being washed with water and dried, is introduced processes in which the chlorine is generated in the chlorinating vat, the reagents used being dilute solutions of bleaching powder and an acid. Munktell's process is of this type. In the Thies process, used in many districts in the United States, the vats are rotating barrels made in the latter forms, of iron lined with lead, and provided with a filter formed of a finely perforated leaden grate running from one end of the barrel to the other, and rigidly held in place by wooden frames. Chlorine is generated within the barrel from sulphuric acid and chlorine of lime. After the barrel is rotated, and when the chlorination is complete the precipitant is emptied out, and the quartz or some similar material, and the filtrate led to settling tanks.

After settling the solution is run into the precipitating tanks. The precipitants used are either sodium sulphide or sodium carbonate, alone or together. The precipitants are of two kinds, one of which consists of sodium carbonate, supplied by dissolving in dilute sulphuric acid, the reaction follows the equation $\text{AuCl}_3 + 3\text{FeSO}_4 + \text{Fe}_2\text{SO}_4 = \text{FeCl}_3 + \text{Fe}_2(\text{SO}_4)_3 + \text{Au}$. At the same time any lead, calcium, barium and strontium present are precipitated as sulphates; it is therefore advantageous to remove these metals by the preliminary addition of sulphuric acid, which also serves to keep any basic iron salts in solution. The precipitation is carried out in tanks or vats supplied with wooden sides and a cement bottom. The solutions are well mixed by stirring with wooden poles, and the gold allowed to settle, the time allowed varying from 12 to 72 hours. The supernatant liquid is led into settling tanks where a further amount of gold is deposited, and is then filtered into the discharge. The sand, the sawdust being afterwards burnt and the gold separated from the ashes and the sand treated in the chlorinating vat. The charcoal in which the gold is washed, treated with salt and sulphuric acid to remove iron salts, roughly dried by pressing in cloths or on filter paper, and then melted with salt, borax and nitre in graphite crucibles. Thus prepared it has a fineness of 900–950, the chief impurity being charcoal.

Charcoal is used as the precipitant at Mount Morgan, Australia. Its use was proposed as early as 1818 and 1819 by Hare and Henry; Percy had used it in 1853. The process was patented by Day and others in 1854, and works in Carolina in 1858. The action is not properly understood; it may be due to the reducing gases (hydrogen, hydrocarbons, &c.) which are invariably present in wood charcoal. The process is not materially changed by the charcoal, but the partially carbonised charcoal, is precipitated, and the charcoal being afterwards burned. It has been found that the reaction proceeds faster when the solution is heated.
Precipitation with sulphur dioxide and sulphuretted hydrogen proceeds much more rapidly, and has been adopted at many works. Sulphur dioxide, generated by burning sulphur, is forced into the solution under pressure, where it reacts with any free chlorine present to form hydrochloric and sulphuric acids. Sulphuretted hydrogen, obtained by treating iron sulphide or a coarse matte with dilute sulphuric acid, is forced in similarly. The precipitate produced consists of a mixture together with iron, arsenic, antimony, copper, silver and lead which may be present. The precipitate is collected in a filter-press, and then roasted in muffles furnaces with zinc oxide and sodium carbonate. The fineness of the gold so obtained is 900 to 950.

4. Cyanide Process.—This process depends upon the solubility of gold in a dilute solution of potassium cyanide in the presence of sodium or potassium carbonate and sufficient alkali to precipitate the solution of the gold by metallic zinc or by electrolysis. The solubility of gold in cyanide solutions was known to K. W. Scheele in 1782; and to D. R. D. Campbell, in 1832, who first worked the process by the action of potassium cyanide on the gold-precipitating films of the metal. L. Elsner recognized, in 1846, the part played by the atmosphere, and in 1879 Dixon showed that bleaching powder, manganese dioxide, and other oxidizing agents, facilitated the solution. S. B. Christy (Trans. A.I.M.E., 1866, vol. 26) has shown that the solution is hastened by many oxidizing agents, especially sodium and manganese dioxides and potassium ferricyanide. According to G. Bodlander (Zeit. f. Edelmetall,, 1899) the rate of solution in cyanide solution is dependent upon the concentration of the cyanide in the solution of the gold the finer the solution the quicker the solution—and on the concentration of the cyanide—the rate increasing until the solution contains about 50 g. per litre; and then decreasing fairly stationary with increasing concentration. The action proceeds in two stages; in the first, the hydrogen peroxide and potassium aurocyane are formed, and in the second the hydrogen peroxide oxidizes a further quantity of cyanide solution to cyanogen, as shown in the following reaction:

\[2KCN + O_2 + H_2O_2 \rightarrow 2KCN + H_2O + 4CN^- + \text{potential energy}\]

The commercial process was patented in 1870 by MacArthur and Forrest, and is now in use all over the world. It is best adapted for free-milling ores, especially after the bulk of the gold has been removed by amalgamation. It has been especially successful in the Transvaal. In the Witwatersrand the ore, which contains about 9 dwts. of gold to the metric ton (2000 lb.), is stamped and amalgamated. The ore is broken into 31 to 35 mesh in a jaw; the rinses from the cyanidation are cyanidated, about 2 dwts. more being thus extracted. The total cost per ton of ore treated is about 6s., of which the cyaniding costs from 2s. to 4s.

The process embraces three operations: (1) Solution of the gold; (2) precipitation of the gold; (3) treatment of the precipitate. The ores, having been broken and ground, generally in tube mills, until they pass a 150 to 200-mesh sieve, are transferred to the leaching vats, which are constructed of wood, iron or many iron, steel coated inside and out with pitch, of circular section and holding up to 1000 tons, have come into use. The diameter is generally 26 ft., but may vary from 15 to 30 ft. by those who consider that the quantity of ore is best expressed in terms of diameter. The vats are fitted with filters made of cloco-nut-mattting and jute cloth supported on wooden frames. The leaching is generally carried out with a strong, medium, and with a weak liquor, in the order named. A strong liquor is one containing 2 parts of cyanide to 1 part of gold. The strengths employed depend also upon the mode of precipitation adopted, stronger solutions (up to 0-25% KCN) being used for cyanide precipitation; for electrolytic precipitation the solution may contain up to 0-1% KCN. The cyanides from the vats to the electrolyising baths or precipitating tanks, and the leached ores are removed by means of doors in the sides of the vats into the leaching tanks, which are a little larger than the vats and hold for 50 to 60 tons. They are cylindrical, 26 ft. in diameter and 14 ft. 6 in. in height. They are covered with a conical top and a conical bottom, which is closed with a door. The leaching tanks are divided into flat-bottomed compartments, each having sixteen holes to the square inch and bearing zinc turnings. The gold and other metals are precipitated on the undersides of the turnings and fall to the bottom of the compartments as a black slime. The slime is cleaned out fortnightly or monthly, the zinc turnings being cleaned by rubbing and the supernatant liquor allowed to settle in the precipitating boxes or in separate vessels. The slime so obtained consists of finely divided gold and silver (50-70%), plus copper, arsenic, antimony, and other impurities, and contains 15 to 18% of free silver in solution and 1 to 2% of lead. The precipitated gold is partly fused and cupelled. Its advantages over the zinc process are that the deposited gold is purer and more readily extracted, and that weaker solutions can be employed, and the solubility of cyanide to the extent of 10 g. is practised. In the Transvaal the liquors, containing about 150 grains of gold per ton, and from 0-08 to 0-01% of cyanide, are treated in rectangular vats in which are placed a series of iron and leaden plates at intervals of 1 ft. apart. The cathodes, which are sheets of thin lead foil weighing 1½ lb. to the sq. yd., are removed monthly, their gold content being from 0·5 to 10% and after melting are used in reverberatory furnaces to get gold containing 2 to 40% of gold. Cupellation was first practised about 900 fine. Many variations of the electrolytic process as above outlined have been suggested, S. Cowper Coles has suggested allowing cyanogenic solutions to act on zinc anodes and lead covered with cyanide. The gold becomes removed from the iron cathodes by a brief immersion in molten lead; in the Pelaton-Cerici process the gold is amalgamated at a mercury cathode (see below).

Refining or Parting of Gold.—Gold is almost always silver bearing, and it may be also noticed that silver generally contains some gold. Consequently the separation of these two metals is one of the most important metallurgical processes. In addition to the separation of the silver the operation extends to the elimination of the last traces of lead, tin, arsenic, &c. which have resisted the preceding cupellation.

The "wet" process, by means of which the gold was placed on the fire in an earthen vessel with treble its weight of salt, and that it was afterwards again exposed to the fire with two parts of salt and one of argillaceous rock, which, in the presence of moisture, effected the decomposition of the salt; by this means the silver became converted into chloride.

The methods of parting can be classified into "dry," "wet" and electrolytic methods. The "dry" methods the silver is converted into sulphide or chloride, the gold remaining unaltered; in the "wet" methods the silver is dissolved by nitric acid or boiling sulphuric acid, and in the "electrolytic" process the silver is precipitated by the action of a current of electricity. The gold remains in solution. In the electrolytic method, the wet process of refining by sulphuric acid, together with the electrolytic process, being the only ones now practised. The conversion of silver into the sulphide may be effected by heating with antimony sulphide, litharge and sulphur, pyrites, or with carbon (10%); Lewis showed the process was employed in the olden time. The antimony, or Guss und Fluss, method was practised up till 1846 at the Dresden mint; it is only applicable to silvers containing more than 50% of gold. The fusion results in the formation of a gold-antimony alloy, from which the antimony is removed by an oxidizing fusion with nitre. The sulphur and litharge, or Pfannenschmied, process was used to convert the gold to a gold-silver alloy by means of carbon (15%), to which was added a little pyrite, or iron pyrites (10%), and the wet process of refining by sulphuric acid, together with the electrolytic process, being the only ones now practised. The conversion of silver into the chloride may be effected by means of salt—the "cementation" process—or other chlorides, or by free chlorine—Miller’s process. The first process consists essentially in dissolving the silver in a solution of silver nitrate, then forming the chloride, and after washing the chloride formed, while the gold is recovered by washing. It is no longer employed. The second process depends upon the fact that, if chloridized acid is added into the molten alloy, the base metals and the silver that is free silver and base metals are converted into chlorides, while the gold is precipitated by Lewis Thompson, but it was only applied commercially after Miller’s improvements in 1867, when it was adopted at the Sydney mint. Sir William Henry, of the British Australian Bank, of Sydney, also used the process; it is especially suitable to contain small silver and base metals—a character of Australian gold—but it yields to the sulphuric acid and electrolytic methods in point of economy.
The separation of gold from silver in the wet way may be effected by nitric acid, sulphuric acid or by a mixture of sulphuric acid and \textit{aqua regia}.

Gold being converted by nitric acid is of considerable antiquity, being mentioned by Albertus Magnus (13th cent.), Birincuccio (1540) and Agricola (1556). It is now rarely practised, although in some refineries both the nitric acid and the sulphuric acid processes are combined, the alloy being first treated with nitric acid, and subsequently with a solution of platinic acid. Each pound of granulated metal is treated with a pound and a quarter of nitric acid of specific gravity 1.32. The method is sometimes employed in the assay of gold.

When separating gold from silver, the process usually adopted for separating gold from silver, was first employed on the large scale by \textit{d'Arcet} in Paris in 1802, and was introduced into the Mint refinery, by Mathison in 1822. It is based upon the principle of dissolving the platinums, and the gold of each pound of granulated metal is treated with a pound and a quarter of nitric acid to convert silver and copper into soluble sulphates without attacking the gold, the silver sulphate being subsequently reduced to the metallic state by copper plates with the formation of copper sulphate. This is applicable to any alloy, and is the best method for parting gold with the exception of the electrolytic method.

The process embraces four operations: (1) the preparation of an alloy containing gold and silver; (2) the treatment with sulphuric acid; (3) the treatment of the residue for gold; (4) the treatment of the solution for silver.

The bullion is removed as completely as possible any lead, tin, bismuth, antimony, arsenic and tellurium, impurities which impair the properties of gold and silver, by an oxidizing fusion, \textit{e.g.} with nitre. Over 10\% of copper makes the parting difficult; consequently, when the percentage of copper does not exceed 10\%, the addition of silver free from copper, or else the copper is removed by a chemical process. Other undesirable impurities are the platinum metals, special treatment being necessary when these substances are present. The alloy, after the preliminary refining, is granulated being poured, while molten, in a thin stream into cold water which is kept well agitated.

The acid treatment is generally carried out in cast iron pots; platinum vessels used to be employed, while porcelain vessels are only used for small operations, \textit{e.g.} for charges of 190 to 225 oz. as at Oker in the Harz. The pots, which are usually cylindrical with a hemispherical bottom, are used as much for saving heat as for convenience of cleaning. They are provided with lids, made either of lead or of wood lined with lead, which have openings to serve for the introduction of the alloy and for the escape of gases. An iron tube to lead off the vapours evolved during the operation. The bullion with about twice its weight of sulphuric acid of 66° Bé is placed in the pot, and the whole gradually heated. Since the action is sometimes very violent, especially when the bullion is treated in the granulated form (i.e. stealer when thin plates are operated upon), it is found expedient to add the acid in several portions. The heating is continued for 4 to 12 hours according to the amount of silver present; the end of the reaction is known by the precipitation of a white precipitate on the sides of the vessel, allowed to cool, and the residue, which settles to the bottom of the pot, consists of gold together with copper, lead and iron sulphates, with some of the strong sulphuric acid. The solution is then made to separate if present in sufficient quantity and the solution be sufficiently cooled. The solution is removed by ladles or by siphons, and the residue is leached out with boiling water; this removes the sulphate, as well as lead in amorphous form, and is still present and, according to M. Pettenkofer, it is impossible to remove all the silver by means of sulphuric acid. Several methods are in use for removing the silver. Fusion with an alkaline bisulphate converts the silver into the sulphate, which may be extracted by boiling with sulphuric acid and then with water. Another process consists in treating a mixture of the residue with one-quarter of its weight of calcined sulphur sulphate with boiling water, and by boiling gold and a small quantity of acid. Or the alloy is dissolved in \textit{aqua regia}, the solution filtered from the insoluble silver chloride, and the gold precipitated by ferrous chloride.

The precipitate in the solution obtained in the sulphuric acid boiling is recovered by a variety of processes. The solution may be directly precipitated with copper, the copper passing into solution as copper sulphate, and the silver separating as a mud, termed "cement silver." Or the silver sulphate may be separated from the solution by cooling and dilution, and then mixed with iron clippings, the interaction being accompanied with a considerable evolution of heat. The method of precipitating the gold by 

The electrolytic parting of gold and silver has been shown to be more economical from the energy point of view than the use of the fuence of the sulphuric acid process. One process depends upon the fact that, with a suitable current density, if a very dilute solution of silver nitrate be electrolysed between a loggerous silver anode and a silver cathode, the gold and much of the silver will be precipitated at the cathode, the gold remaining at the anode. The silver is quite free from gold, and the gold after boiling with nitric acid has a fineness of over 99.5.

Gold is left in the anode slime when copper or silver are refined by the usual processes, but if the gold preponderate in the anode these processes are inapplicable. A cyanide bath, as used in electrophating, makes the gold available in the gold anodes (silver, copper, &c.) passing into gold solution with a small proportion of silver, lead or bismuth, and a subsequent patent specification (1896) and a paper by Wohllin (\textit{Zeits. f. Elektrochem.}, 1897, 3, p. 353) describes a process for their separation. material with a small proportion of silver, lead or bismuth, and a subsequent patent specification (1896) and a paper by Wohllin (\textit{Zeits. f. Elektrochem.}, 1897, 3, p. 353) describes a process for their separation.

Gold and silver thread. Under this heading some general account may be given of gold and silver threads, threads and gimp used in connexion with varieties of weaving, embroidery and twisting and plaiting or lace work. To this day, in many oriental centres where it seems that early traditions of the knowledge and the use of fabrics wholly or partly woven, ornamented, and embroidered with gold and silver have been maintained, the passion for such brilliant and costly textiles is still strong and prevalent. One of the earliest mentions of the use of gold in a woven fabric occurs in the description of the ephod made for Aaron (Exod. xxxix. 2, 3), "And he made the ephod of gold, blue, and purple, and scarlet, and fine twined linen. And they did beat the gold into thin plates, and cut it into wires (strips), to work it in the blue, and in the purple, and in the red linen, and in the linen, with couching work." This is suggestive of early Syrian or Arabic in-darning or weaving with gold strips or tinsel. In both the \textit{Hidad} and the \textit{Odyssy} allusion is frequently made to inwoven and embroidered golden textiles. Assyrian sculpture gives an elaborately designed ornament upon the robe of King Assur-nasir-pal (884 B.C.) which was probably an interweaving of gold and coloured threads, and testifies to the consummate skill of Assyrian or Babylonian workers at that date. From Assyrian and Babylonian weavers the conquering Persians of the time of Darius derived their celebrity as weavers and users of splendid stuffs. Herodotus describes...
the corselet given by Amasis king of Egypt to the Minerva of Lindus and how it was inwoven or embroidered with gold. Darius, we are told, wore a war mantle on which were figured (probably inwoven) two golden hawks as if pecking at each other. Alexander the Great is said to have found Eastern kings and princes arrayed in robes of gold and purple. More than two thousand years later Haiminsfeld (the third bearing the name Attalos) who gave much attention to working in metals and is mentioned by Pliny as having invented weaving with gold, hence the historic Attalos cloths. There are several references in Roman writings to costumes and stuffs woven and embroidered with gold threads and the Graeco-Roman chrysa-phrygium and the Roman aurī-phrygium are evidences not only of Roman work with gold threads but also of its indebtedness to Phrygian sources. The famous tunics of Agrippina and those of Helogonarius are said to have been of tissues made entirely with gold threads, whereas the robes which Marcus Aurelius found in the treasury of Hadrian, as well as the costumes sold at the dispersal of the wardrobe of Commodus, were different in character, being of fine linen and possibly even of silken stuffs inwoven or embroidered with gold threads. The same description is perhaps correct of the reputedly splendid hangings with which King Dagobert decorated the early medieval oratory of St Denis. Reference to these and many such stuffs is made by the respectively contemporary or almost contemporary writers; and a very full and interesting work by Monsieur Francisque Michel (Paris, 1852) is still a standard book for consultation in respect of the history of silk, gold and silver stuffs.

From indications such as these, as well as those of later date, one sees broadly that the art of weaving and embroidering with gold and silver threads passed from one great city to another, travelling as a rule westward. Babylon, Tarsus, Bagdad, Damascus, the islands of Cyprus and Sicily, Constantinople, Venice and southern Spain appear successively in the process of time as famous centres of the manufacture of these stuffs. During the middle ages European royal personages and high ecclesiastical dignitaries used cloth and tissues of gold and silver for their state and ceremonial robes, as well as for costly hangings and decoration; and various names—cichouton, tartarium, naques or nac, baudekin or baldaquin (Bagdad) and tissue—were applied to textiles in the making of which gold threads were almost always introduced in combination with others. The thin flimsy paper known as tissue paper is so called because it originally was placed between the folds of gold tissue (or weaving) to prevent the continuous surfaces from fusing each other. Under the articles dealing with carpets, embroidery, lace and tapestry will be found notices of the occasional use in such productions of gold and silver threads. Of early date in the history of European weaving are rich stuffs produced in Southern Spain by Moors, as well as by Saracenics and Byzantine weavers at Palermo and Constantinople in the 12th century, in which metallic threads were freely used. Equally esteemed at about the same period were corresponding stuffs made in Cyprus, whilst for centuries later the merchants in such fabrics eagerly sought for and traded in Cyprus gold and silver threads. Later the actual manufacture of them was not confined to Cyprus, but was also carried on by Italian trade and trimming makers from the 14th century onwards. For the most part the gold threads referred to were of silver gilt. In rare instances of middle-age Moorish or Arabic fabrics the gold threads are made with strips of parchment or paper gilt and still rarer are instances of the use of real gold wire.

In India the preparation of varieties of gold and silver threads is an ancient and important art. The “gold wire” of the manufacture has been and is as a rule silver gilt, the silver wire being, of course, composed of pure silver. The wire is drawn by means of simple draw-plates, with rude and simple appliances, from rounded bars of silver, or gold-plated silver, as the case may be. The wire is flattened into strip, tinsel or ribbon-like form, by passing fourteen or fifteen strands simultaneously, over a fine, smooth, round-topped anvil and beating each as it passes with a heavy hammer having a slightly convex surface. Such strips or tinsel of wire so flattened are woven into Indian sonīri, tissue or cloth of gold, the web or warp being composed entirely of golden strips, and ruperi, similar tissue of silver. Other gold and silver threads suitable for use in woven braids, pillow and monastic lace making, &c., consist of fine strips of flattened wire wound round cores of orange (in the case of silver, white) silk thread so as to completely cover them. Wires flattened or partially flattened are also twisted into exceedingly fine spirals and much used for heavy, embroidery. Spangles for embroideries, &c., are made from spirals of comparatively stout wire, by cutting them down ring by ring, laying each C-like ring on an anvil, and by a smart blow with a hammer flattening it out into a thin round disk with a slit extending from the centre to one edge. The demand for many kinds ofloom-woven and embroidered gold and silver work in India is immense, and the variety of textiles so ornamented is also very great, chief amongst which are the golden or silvery tinsel fabrics known as knicks.

Amongst Western communities the demand for gold and silver embroideries and braid lace now exists chiefly in connexion with naval, military and other uniforms, masonic insignia, court costumes, public and private liveries, ecclesiastical robes and draperies, theatrical dresses, &c.

The proportions of gold and silver in the gold thread for the woven braid lace of ordinary kind varies, but in all cases the proportion of gold is over 60 per cent. An ordinary gold braid wire is drawn from a bar containing 90 parts of silver and 7 of copper, and plated with 3 of gold. On an average each ounce troy of a bar so plated is drawn into 1,500 yds. of wire; and therefore about 16 grains of gold cover 1 m. of wire.

GOLDAST AB HAIMINSFELD, MELCHIOR (1576-1633), Swiss writer, an industrious though uncritical collector of documents relating to the medieval history and Constitution of Germany, was born on the 6th of January 1576 (some say 1578), as the son of Bischofingcr, rector of St. Cyriac, in the city of Thurgau. His university career, first at Ingolstadt (1585-1586), then at Altdorf near Nuremberg (1597-1598), was cut short by his poverty, from which he suffered all his life, and which was the main cause of his wanderings. In 1598 he found a rich protector in the person of Bartholomaeus Schobinger, of St Gall, by whose liberality he was enabled to study at St Gall (where he first became interested in medieval documents, which abound in the conventual library) and elsewhere in Switzerland. Before his patron's death (1604) he became (1605) secretary to Henry, duke of Bouillon, with whom he went to Heidelberg and Frankfort. But in 1604 he entered the service of the Baron von Hohenas, then the possessor of the precious MS. volume of old German poems, returned from Paris to Heidelberg in 1688, and, partially published by Goldast. Soon he was back in Switzerland, and by 1666 in Frankfort, earning his living by preparing and correcting books for the press. In 1611 he was appointed councillor at the court of Saxe-Weimar, and in 1615 he entered the service of the court of Schaumburg at Bückeburg. In 1624 he was forced by the war to retire to Bremen; there in 1625 he deposited his library in that of the town (his books were bought by the town in 1646, but many of his MSS. passed to Queen Christina of Sweden, and hence are now in the Vatican library), he himself returning to Frankfort. In 1627 he became councillor to the emperor and to the archbishop-elector of Trèves, and in 1633 passed to the service of the landgrave of Hesse-Darmstadt. He died at Giessen early in 1635.

His immense industry is shown by the fact that his biographer, Senckenburg, gives a list of 65 works published or written by him, some extending to several substantial volumes. Among the more important are his Paracarmicii veterum part. 1. (1606), which contained the old German tales of Kunig Tyrul von Schotten, the Wünsche and the Wundsckin; Succici carum scriptores (Frankfort, 1605, new edition, 1727); Rurum Alamannici scriptores (Frankfort, 1606, new edition by Senckenburg, 1730); Constitutiones imperiales (Frankfort, 1607-1613, 4 vols.; Monarchia s. Romani imperii (Hanover and Frankfort, 1612-1614).
GOLDBEATING—GOLDBERG

3 vols.; Commentarii de regni Bohemiae juribus (Frankfort, 1627, new edition by Schmink, 1719). He also edited De Thou's History (1606-1610) and William Birch's works (1610). In 1688 a volume of letters addressed to him by his learned friends was published.

Life by Senckenburg, prefixed to his 1730 work. See also R. von Raumer's Geschichte d. germanischen Philologie (Munich, 1870). (W. A. B. C.)

GOLDBEATING.—The art of goldbeating is of great antiquity, being referred to by Homer; and Pliny (N. H. 33. 19) states that 1 oz. of gold was extended to 750 leaves, each leaf being four fingers (about 3 in.) square; such a leaf is three times as thick as the ordinary leaf gold of the present time. In all probability the art originated among the Eastern nations, where the working of gold and the use of gold ornaments have been distinguishing characteristics from the most remote periods. On Egyptian mummy cases specimens of original leaf-gilding are met with, where the gold is so thin that it resembles modern gilding (q.v.). The minimum thickness to which gold can be beaten is not known with certainty. According to Mersenne (1621) 1 oz. was spread out upon 105 sq. ft.; Réaumur (1711) obtained 1463 sq. ft.; other values are 189 sq. ft. and 300 sq. ft. Its malleability is greatly diminished by the presence of other metals, even in very minute quantity. In practical the average degree of tenacity to which the gold is reduced is not nearly so great as the last example quoted above. A "book of gold" containing 15 leaves measuring each 31 sq. in., equal to an area of 764 sq. in., generally weighs from 4 to 5 oz. grains.

The gold used by the goldbeater is variously alloyed, according to the colour required. Fine gold is commonly supposed to be incapable of being reduced to thin leaves. This, however, is not the case, although its use for ordinary purposes is undesirable on account of its greater cost. It also adheres on one part of a leaf touching another, thus causing a waste of labour by the leaves being spoiled; but for work exposed to the weather it is much more durable, and does not tarnish or change colour. The external malleability of many gilded public buildings, e.g. the Albert Memorial in Kensington Gardens, London, is done with pure gold. The following is a list of the principal classes of leaf recognized and ordinarily prepared by British beaters, with the proportions of alloy per oz. they contain.

The process of goldbeating is as follows: The gold, having been alloyed according to the colour desired, is melted in a crucible at a higher temperature than is simply necessary to fuse it, as its malleability is lost by exposure to a great heat; this does not interfere with its malleability, gold differing in this respect from some other metals. It is then cast into an ingot, and flattened, by rolling between a pair of powerful smooth steel rollers, into a ribbon of 14 in. wide and 10 ft. in length. After being flattened it is annealed and cut into pieces of about 65 grs. each, or about 75 per oz., and placed between the leaves of a "cutch," which is about ⅛ in. thick and 3 in. square, containing about 180 leaves of a tough paper. Formerly fine vellum was used for this purpose, and generally still it is interleaved in the proportion of about one of vellum to six of paper. The cutch is beaten on for about 20 minutes with a 17-lb hammer, which redounds to the elasticity of the skin, and saves the labour of lifting, by which the gold is spread to the size of the cutch; each leaf is then taken out, and cut into four pieces, and put between the skins of a "shodder," ⅛ in. square and ⅛ in. thick, containing about 720 skins, which have been worn out in the finishing or "mould" process. The shodder requires about twice the beating upon with a 9-lb hammer. As the gold will spread unequally, the shodder is beaten upon after the larger leaves have reached the edges. The effect of this is that the margins of larger leaves come out of the edges in a state of dust. This allows time for the smaller leaves to reach the full size of the shodder, thus forming a general even skin. Each leaf is again cut into four pieces, and placed between the leaves of a "gold," composed of about 950 of the finest gold-beaters' skins, ⅜ in. square and ⅛ in. thick, the contents of one shodder filling three moulds. The material has now received a sufficient degree of thickness; and on the fineness of the skin and judgment of the workman the perfection and thinness of the leaf of gold depend. During this process the hammer is allowed to fall principally upon the centre of the mould. This driving of the cutches upon the edges of the leaves, the sides of which readily coalesce and unite without leaving any trace of the union after being beaten upon. At the second hour, when the gold is about the two-thirds part of an inch thickened, it is for the first time permits the transmission of the rays of light. Pure gold, or gold but slightly alloyed, transmits green rays; gold highly alloyed with silver transmits pale violet rays. The mould requires in all about four hours beating with a 17-lb hammer. The ordinary thinness for the gold leaf of commerce will be reached. A single ounce of gold will at this stage be extended to 75×4×4=1200 leaves, which will trim to squares of about 3½ sq. in. each. The finished leaf is then taken out of the mould, and the rough edges are trimmed off by slips of the ratar fixed in parallel grooves of an instrument called a waggon, the leaf being laid upon a leatheren cushion. The leaves thus prepared are placed into "books" capable of holding 25 leaves each, which have been rubbed over with red ochre to prevent the gold clinging to the paper. Dentist gold is gold leaf prepared no farther than the cutch stage, and should be perfectly pure gold.

By the above process also silver is beaten, but not so thin, the inferior value of the metal not rendering it commercially desirable to beat it to such a much laborious process. Copper, containing zinc, palladium, lead, cadmium, platinum and aluminium can be beaten into thin leaves, but not to the same extent as gold or silver.

The fine membrane called goldbeater's skin, used for making up the shodder and mould, is the outer coat of the caecum or blind gut of the ox. It is stripped off in lengths about 25 or 30 in., and freed from fat by dipping in a solution of caustic alkali and scraping with a blunt knife. It is afterwards stretched on a frame; two membranes are glued together, treated with a solution of corrosive sublimate or camphor in isinglass, and subsequently concert by being heated over an oil fire, or into squares of 5 or 5½ in.; and to make up a mould of 950 pieces the gut of about 380 oxen is required, about 2½ skins being got from each animal. A skin will endure about 200 beatings in the mould, after which it is fit for use in the shodder alone.

The dryness of the cutch, shodder and mould is a matter of extreme delicacy. They require to be hot-pressed every time they are used, although they may be used daily, to remove the moisture which they acquire from the atmosphere; wetness, however, when they acquire so little moisture that a difficulty arises from their over-dryness, whereby the brilliancy of the gold is diminished, and it spreads too slowly by slowly under the hammer. If the cutch or shodder be damp, the gold will become pierced with innumerable microscopic holes; and in the moulds in its more attenuated state it will become reduced to a pulverulent state. This condition is considerably remedied by alloyed gold, or solid gold, so that necessary each skin of the mould should be rubbed over with calcined gypsum each time the mould may be used, in order to prevent the adhesion of the gold to the surface of the skin in beating.

GOLDBERG, a town of Germany, in the Prussian province of Slesia, 14 m. by rail S.W. of Liegnitz, on the Katzbach, an affluent of the Oder. Pop. (1905) 6804. The principal buildings are an old church dating from the beginning of the 13th century, the newly erected Town-Presbyterian church, completed in 1876, for the board and education of orphans with the classical school or gymnasium (founded in 1524 by Duke Frederick II. of Liegnitz), which in the 17th century enjoyed great prosperity, and numbered Wallenstein among its pupils. The chief manufactures are woolen cloth, flannel, gloves, stockings, leather and beer, and there is a considerable trade in corn and fruit. Goldberg owes its origin and name to a gold mine in the neighbourhood, which, however, has been wholly abandoned since the time of the Hussite wars. The town obtained civic rights in 1211. It suffered heavily from the Tatars in 1241 and the Mongols in 1234, from the Hussites in 1428, and from the Saxons, Imperial and Swedish forces during the Thirty Years' War. On the 27th of May 1813 a battle took place near it between the French and the

1 Goldberg is also the name of a small town in the grand-duchy of Mecklenburg-Schwerin.
GOLD COAST

in council, 22nd of October 1906) is in general 130 m. from the coast, but in the central portion of the colony the southern limits of Ashanti project wedge-like to the confluence of the rivers Obin and Prah, which point is but 60 m. from the sea at Cape Coast. The combined area of the Gold Coast, Ashanti and the Northern Territories, is about 80,000 sq. m., with a total population officially estimated in 1908 at 2,700,000; the Gold Coast colony alone has an area of 24,200 sq. m., with a population of over a million, of whom 200,000 are Europeans.

Physical features.—Though the lagoons common to the West African coast are found both at the western and eastern extremities of the colony (Assini in the west and Kwatta in the east) the greater part of the coast-line is of a different character. Cape Three Points (4° 44' 40" N. 2° 54' 55" W.) juts boldly into the sea, forming the most southerly point of the colony. Thence the coast trends E. by N., and is but slightly indented. The usually low sandy beach is, however, diversified by bold, rocky headlands. The flat belt of country does not extend inland any considerable distance, the spurs of the great plateau which forms the major part of West Africa advancing in the east, in the Akwapim district, near to the coast. Here the hills reach an altitude of over 2000 ft. Out of the level plain rise many isolated peaks, generally of conical formation. Numerous rivers descend from the hills, but bars of sand block their mouths, and the Gold Coast possesses no harbours. Great Atlantic rollers break unceasingly on the shores of the Volta, Akwapim, and the Prah. The Akwapim or Snake river traverses a fertile country, and reaches the sea some 20 m. west of Cape Three Points. It has a course of about 150 m., and is navigable in stretches up to the mouths for all but canoes. The Prah (the river) is regarded as a fetid stream by the Fanti and Ashanti. One of its sub-tributaries has its rise near Kumasi. The Prah rises in the N. The Gold Coast colony and Volta basin are joined by the Ofin, which comes from the north-west. The united stream flows S. and reaches the sea in 4° 35' W. As a waterway the river, which has a course of 400 m., is almost useless, owing to the numerous rapids in its course. A small branch of the Ofin has some distance in its lower course forms the boundary between the colony and the Ivory Coast.

Geology.—Crystalline rocks occur at intervals along the coast belt, but the most interesting formation is the "Banket" of South Africa they are most probably of more recent date. The alluvial slits and gravels also carry gold.

Climate.—The climate on the coast is hot, moist and unhealthy, especially for Europeans. The mean temperature in the shade in the coast towns is 78° to 86° F. Fever and dysentery are the diseases most feared and dreaded by the Europeans. The sanitary conditions are such that although they enjoy tolerable health and live to an average age, are subject in the rainy season to numerous chest complaints. There are two wet seasons. From April to August are the greater rains, whilst in September and November a recorer occurs the "smallest" one.

From the end of December to March the dry harmattan wind blows from the Sahara. In consequence of the prevalence of the sea-breeze from the south-west the western portion of the colony, up to the mouth of the Sekum river (a small stream at the western end of Ashanti) is called the windward district, the eastward portion being known as the leeward. The rainfall at Accra, in the leeward district, averages 27 in. in the year, but at places in the windward district is much greater, averaging 79 in. at Axim.

Flora.—The greater part (probably three-fourths) of the colony is covered with primeval forest. Here the vegetation is so luxuriant that for some distances the sky is cut out from view. Many of the trees are very tall, and the struggle to reach the sunlight the forest growths are almost entirely vertical. The chief trees are silk cottons, especially the bombax, and gigantic hard-wood trees, such as the African mahogany, chobba, and camwood. The bombax rises to a straight column-like shaft, 25 to 30 ft. in circumference, and then flowers horizontally a large number of branches. The lowest growth in the forest consists of ferns andherbaceous plants. Of the ferns some are climbers reaching 30 to 40 ft. up the stems of the trees they entwine. Flowering plants are comparatively rare; they include orchids and a beautiful white lily. The "bush" or intermediate growth is made up of smaller trees, the rain-hardened baobabs, and other creepers, some as thick as hawsers, bamboos and sensitive mimosa, and has a height of from 30 to 60 ft. The creepers are found nothing on the bush, but running from the branches of the highest trees. West of the Prah the forest comes down the edge of the Atlantic. East of that river the coast land is covered with bushes 5 to 12 ft. high, occasional large trees and groves of oil palms. Still farther east, by Accra are numerous banyans, baobabs, Euphorbias, and immediately west of the lower Volta forests of oil palms and grassy plains with fan palms. Below all these eastern regions is a belt of thin forest country before the denser forest is reached. In the north-east are stretches of orchard-like country with wild plum, shea-butter and kola trees, baobabs, dwarf date and fan palms. The cotton and tobacco plants grow wild. At the mouths of the rivers and along the lagoons the mangrove is the characteristic tree. There are numerous coco-nut palms along the coast. The palm trees and plants also include the orange, pineapple, mango, papaw, banana and avocado or alligator pear.

The fauna of the colony includes the African elephant, hippopotamus, Potto lemurs, jackals, antelopes, buffaloes, wild-hogs and many kinds of monkey, including the chimpanzee and the Colobus vellerosus, whose skin, with long black silky hair, is much prized in Europe. The elephant has been almost exterminated by ivory hunters. The native snakes include pythons, cobras, horned and puff adders and the venomous water snake. Among the lesser denizens of the forest are pythons, horned, puff adders, and the common monitor. Manatees and otters frequent the rivers and lagoons and hippopotami are found in the Volta. Lizards of brilliant hue, tortoises and other reptiles are common. Birds, which are not very numerous, include parrots and hornbills, kingfishers, egrets, hawks, egrets, cranes, curlews, woodpeckers, doves, pigeons, storks, pelicans, swallows, vultures and the spur plover (the last-named rare). Shoals of herrings frequent the coast, and the other fish and the bonyfishto, flying fish, fighting fish and shynose. Sharks abound at the mouths of all the rivers, edible turtle are fairly common, as are the sword fish, dolphin and sting ray (with poisonous caudal spine). Oysters are numerous on rocks running into the sea and on the
exposed roots of mango tree groves. Insect life is multitudinous; beetles, spiders, ants, fireflies, butterflies and jiggs abound. The earthworm is rare. The mosquitoes include the Cleopatra or ordinary kind, the Ochlerotus, which carry malaria fever, and the Anopheles, a striped white and black mosquito which carries yellow-fever.

Inhabitants.—The natives are all of the Negro race. The most important tribe is the Fanti (q.v.), and the Fanti language is generally understood by the residents. The blacks who have been named after the tribes inhabiting them. Those in the western part of the colony are mainly of Fanti stock; the Accra and allied tribes inhabit the eastern portion and are believed to be the aboriginal inhabitants of the whole coast. The Ahanta, an indigenous tribe, who occupy the eastern portion of the colony, have engaged in gold-digging from time immemorial.

The capital of their country is Kibi. The Akwapim (Aquapem), southern neighbours of the Akim, are extensively employed in the coast trade. The Akropong, a clever race, are to be found in all the towns of the West African coast as artisans and sailors. They are employed by the interior tribes as middlemen and interpreters.

On the right bank of the Volta the occupying the lowest marshy land near the sea are the Asante. In the middle of the palm tree woods which grow round about the Akropong, an eminence about 1000 ft. high. Their country lies between 1736; the Basel mission (Evangelical). It is the most important and best known. It is 39 m. N.E. of Accra, stands on a ridge 1400 ft. above sea-level, and is a healthy place for European residents. At this station the aboriginal tribes have been conquered and the Akropong, a large town on the banks of the Volta. Tarkwa is the centre of the gold mining industry in the Wasaw district. Its importance dates from the beginning of the 20th century. Accra, Cape Coast, and Axim are the great gold-producing centres.

Agriculture and Trade.—The soil is everywhere very fertile and the needs of the people being few there is little incentive to work. The farming methods are simple and inexhaustible source of wealth, notably in the oil palm. Among vegetables, yams, sweet potatoes are the most important. Indian corn, yams, cassava, peas, peppers, onions, tomatoes, ground-nuts (Arachis hypogaea), Guinea corn (Sorghum vulgare) and Guinean peach (Arbina gracilea) are all grown. The commonest article of cultivation is, however, the kola nut (Sterculia acuminata), the substitute in West Africa for the betel nut. In 1890 exports were made by the establishment of a government botanical station at Axim, and the Accra Government has issued methodical guidance on methods of cultivation and to enlarge the number of their crops.

This resulted in the formation of hundreds of cocoa plantations, chiefly in the district immediately north of Accra. Subsequently the cultivation of the plant extended to every district of the colony.

The industry had been founded in 1879 by a native of Accra, but it was not until 1901, as the result of the government’s fostering care, that the export became of importance. In that year the quantity exported slightly exceeded 2,000,000 lb. and fetched £42,000. In 1907 the quantity exported was nearly 21,000,000 lb. It is a matter of congratulation that the British government and the British Cocoa Growing Association in co-operation with the growers of cotton and tobacco, have begun systematically to extend the cultivation of cocoa in the country. By 1912 the cultivation of cocoa had become firmly established. Tobacco and coffee are grown at Axim, Cape Coast, and Adangme.

The chief exports are gold, palm oil and palm kernels, cocoa, rubber, timber (including mahogany) and kola nuts. Of these articles the gold and rubber are shipped chiefly to England, whilst Germany, France and America, take the palm products and kola nuts. The rubber comes chiefly from Ashanti. The imports consist of cotton goods, rum, gin and other spirits, rice, sugar, tobacco, beads, machinery, building materials and European goods generally.

The value of the trade increased from £1,628,309 in 1896 to £4,055,351 in 1906. In the last named year the imports were valued at £2,929,939, and the exports at £1,966,412. While the value of imports increased, it remained nearly stationary since 1902, as the value of exports had nearly trebled in that period. In the five years 1903–1907 the total trade increased from £3,663,456 to £5,007,880. Great Britain is the principal trading partner of the Gold Coast; commerce with France exceeds 60% of the imports. In both import and export trade Germany is second, followed by France and the United States. Specie is included in these totals, over a quarter of a million being imported in 1905.

Fishing is carried on extensively along the coast, and salted and sun-dried fish from Addah and Kwita districts find a ready sale in London. Cloth is woven by the natives from cotton grown and imported from India; the chief raw material is cotton. The salt-cotton industry is a flourishing industry, and salt from the lagoons near Addah is roughly prepared. There are also native artificers in gold and other metal products. A few working begging on the coast. Oudum wood is largely used in building and for cabinet work.

Gold Mining.—Gold is found in almost every part of the colony, but only in a few districts in paying quantities. Although since the discovery of the last 20 years it was not until the last twenty years of the 19th century that efforts were made to extract gold according to modern methods. The richness of the Tarkwa main reef was first
GOLD COAST

205

discovered by a French trader, M. J. Bennat, about 1880. During the period 1880 to 1900 the value of the gold exported varied from a minimum of £35,000 to a maximum of £32,000,000, a figure which is shown in the industry led to the construction of a railroad (see below) to the chief gold-fields, whereby the difficulties of transport were largely overcome. Consequently the taking up of 168 square miles of land in the Ashanti-Asante region by the Gold Coast Company in 1900. This was followed in 1901 by the grant of 2,825 concessions, and a "boom" in the West African market on the London stock exchange. The export of gold dropped to its lowest point, 6,612 oz., worth £22,186, but in 1902 a large company began crushing ore and the output of gold rose to 24,611 oz., valued at £69,980. In 1903 the export of gold touched £1,820,000. It was noted that one-third of the principal gold mines is not in the colony proper, but at Obuasi in Ashanti. Underground labour is performed mainly by Basas and Krumen from Liberia. Old native tribes of the Apollonia and Prestea districts have given up their digging traditions dating from Portuguese times. A good deal of alluvial gold is obtained by dredging apparatus. The use of dredging apparatus is modern, but the natives have worked the alluvial soil and the sand of the seashore for generations to get the gold they contain.

Communications.—The colony possesses a railroad, built and owned by the government, which serves the gold mines, and has its sea terminus at Sekondi. Work was begun in August 1898, but owing to the disturbance caused by the Ashanti rising of 1900 the railroad only reached Tarkwa (39 m.) in May 1901. Thence the line is completed in 141 miles to Kumasi (165 m.) beyond which the extension to Apollonia and Prestea on the Ankobra river. Another railroad, built 1907-10, 35 m. in length, runs from Accra to Mangoase, in the centre of the cocoa growing area. This railroad has been the means of opening up the country.

Tortuous bush tracks are the usual means of internal communication. These are kept in fair order in the neighbourhood of government stations. There is a well-constructed road 141 m. long from Cape Coast to Kumasi, and roads connecting neighbouring towns are maintained by the government. Systematic attempts to make use of the upper Volta as a means of conveying goods to the interior were first tried in 1900. The roads and rivers are the main means of large size running up the stream. Where railways or canoes are not available goods are generally carried on the heads of porters. 60 lb being a fair load. Telegraphs, including all the government towns, and a line starting at Cape Coast stretches far inland, via Kumasi to Wa in the Northern Territories. Accra and Sekondi are in telegraphic communication with Europe, the Ivory Coast, Lagos and the Cape of Good Hope. There is regular and frequent steamship communication with Europe by British, Belgian and German lines.

Administration, Revenue, &c.—The country is governed as a crown colony. The executive is assisted by an administrative council of officials and nominated unofficial members. Laws, called ordinances, are enacted by the governor with the advice and consent of this council. The law of the colony is the common law and statutes of England, with English courts. In 1874, modern ordinances passed since that date. The governor is also governor of Ashanti and the Northern Territories, but in those dependencies the law is that of their respective authorities.

Native laws and customs—which are extremely elaborate and complicated—are not interfered with "except when repugnant to natural justice." Those relating to land tenure and succession may be thus summarized. If the alluvial tenure is not unknown, but most land is held by the tribe or by the family in common, each member having the right to select a part of the common land for his own use. Permanent alienation can only take place with the unanimous consent of the family and is uncommon, but long leases are granted. Succession is through the female, i.e., when a man dies his property goes to his sister's children. The government of the tribes is by their own chiefs, and the supervision of the district commissioners. Slavery has been abolished in the colony. In the Northern Territories the dealing in slaves is unlawful, neither can any person be put in pawn for debt; nor will any court give effect to the relations between master and slave except in so far as those relations may be in accordance with the English laws relating to master and servant.

For administrative purposes the colony is divided into three main sections. The Dutch possession is subdivided into districts presided over by commissioners, who exercise judicial as well as executive functions. The supreme court consists of a chief justice and three puisne judges. The defence of the colony is in the hands of the Governor, the West African Forces, a force of natives controlled by the Colonial Office but officered from the British army. There is also a corps of volunteers (formed 1895).

The chief source of revenue is the customs and (since 1902) railroad receipts, whilst the heaviest items of expenditure are transport (including railways) and mine surveys, medical and sanitary services, and maintenance of the military force. The revenue, which in the period 1894-1898 averaged £244,559 yearly, rose in 1898-1903 to an average of £556,316 a year. For the five years 1901-1907 the average annual revenue was £647,557 and the average annual expenditure £261,000, save for municipal purposes, that is, direct taxation in the colony and no poor-houses exist. There is a public debt of (December 1907) £2,206,694. It should be noted that the estimates are on Ashanti and the Northern Territories is included in the Gold Coast budget.

History.—It is a debated question whether the Gold Coast was discovered by French or by Portuguese sailors. The evidence available is insufficient to prove the assertion, of which there is no contemporary record, that a company of Norman merchants established themselves about 1364 at a place they named La Mina (Elmina), and that they traded with the natives for nearly fifty years, when the enterprise was abandoned. It is well established that a Portuguese expedition under Diogo d'Azambuja, accompanied probably by Christopher Columbus, took possession of (or founded) Elmina in 1481-1482. By the Portuguese it was called variously São Jorge da Mina or Ora del Mina—the mouth of the (gold) mines. That besides alluvial washings they also worked the gold mines was proved by discoveries in the latter part of the 16th century. The Portuguese remained undisturbed in their trade until the Reformation, when the papal bull which had given the country, with many others, to Portugal ceased to have a binding power. English ships in 1553 brought back from Guinea gold to the weight of 150 lb. The fame of the Gold Coast thereafter attracted to it adventurers from almost every European nation. The English were followed by French, Danes, Brandenburgers, Dutch and Swedes. The latter were the first who from the end of the 16th century sought to colonize Portuguese from the Gold Coast, and in whose favour the Portuguese did finally withdraw in 1642, in return for the withdrawal on the part of the Dutch of their claims to Brazil. The Dutch henceforth made Elmina their headquarters on the coast. Traces of the Portuguese occupation, which lasted 160 years, are still to be found, notably in the language of the natives. Such familiar words as palaver, fetish, caboccer and dash (i.e. a gift) have all a Portuguese origin.

An English company built a fort at Kormantine previously to 1651, and some 10 years later Cape Coast Castle was built. The settlements made by the English provoked the hostility of the Dutch and led to war between England and Holland, during which Admiral de Ruyter destroyed (1664-1665) all the English forts save Cape Coast castle. The treaty of Breda in 1667 confirmed the Dutch in the possession of their conquests, but the English speedily opened other trading stations. Charles II. in 1672 granted a charter to the Royal African Company, which built forts at Dixcove, Sekondi, Accra, Whydah and other places, besides repairing Cape Coast Castle. At this time the trade in negroes and gold was very great, and at the beginning of the 18th century the value of the gold exported annually was estimated by Willem Bosman, the chief Dutch factor at Elmina, to be over £200,000. The various European traders were constantly quarrelling among themselves and exercised scarcely any control over the natives. Piracy was rife along the coast, and was not indeed finally stamped out until the middle of the 19th century. The Royal African Company, which lost its monopoly of trade with England in 1700, was succeeded by another, the African Company of Merchants, which was constituted in 1750 to act "for the general welfare of the African trade by government. The slave trade was then at its height and some 10,000 negroes were exported yearly. Many of the slaves were prisoners of war sold to the merchants by the Ashanti, who had become the chief native power. The abolition of the slave trade (1807) crippled the company, which was dissolved in 1821, when the crown took possession of the forts.

Since the beginning of the 19th century the British had begun to exercise territorial rights in the towns where they held forts, and in 1817 the right of the British to control the natives living in the coast towns was recognized by Ashanti. In 1824 the first step towards the extension of British authority beyond the coast region was taken by Governor Sir Charles M'Carthy, who incited the Fanti to rise against their oppressors, the Ashanti. (The Fanti's country had been conquered by the Ashanti in 1807.)
GOLD COAST

Sir Charles and the Fanti army were defeated, the governor losing his life, but in 1826 the English gained a victory over the Ashanti at Dodowah. At this period, however, the home government, disgusted with the Gold Coast by reason of the perpetual disturbances in the protectorate and the trouble it occasioned, determined to abandon the settlements, and sent instructions for the forts to be handed over to a committee of merchants (Sept. 1828), who were given a subsidy of £4000 a year. The merchants secured (1830) as their administrator Mr George Maclean—a gentleman with military experience on the Gold Coast and not engaged in trade. To Maclean is due the consolidation of British interests in the interior. He concluded, 1831, a treaty with the Ashantians advantageous to the Fanti, whilst with very inadequate means he contrived to extend British influence over the whole region of the present colony. In the words of a Fanti trader Maclean understood the people, “he settled things quietly with them and the people also loved him.” Complaints that Maclean encouraged slavery reached England, but these were completely disproved, the governor being highly commended on his administration by the House of Commons Committee. It was decided, nevertheless, that the Colonial Office should resume direct control of the forts, which was done in 1843. Maclean continuing to direct native affairs until his death in 1847. The jurisdiction of England on the Gold Coast was defined by the 6th of March 1844, an agreement with the Europeans brought home. The crown received the right of trying criminals, repressing human sacrifice, &c. The limits of the protectorate inland were not defined. The purchase of the Danish forts in 1850, and of the Dutch forts and territory in 1871, led to the consolidation of the British power along the coast; and the Ashanti war of 1873–74 resulted in the extension of the area of British influence. Since that time the colony has been chiefly engaged in the development of its material resources, a development accompanied by a slow but substantial advance in civilization among the native population. (For further historical information see ASHANTI.)

Northern Territories.

The Northern Territories of the Gold Coast form a British protectorate to the north of Ashanti. They are bounded W. and N.—where 11° N. is the frontier line except at the eastern extremity—by the French colonies of the Ivory Coast and Upper Senegal and Niger, E. by the German colony of Togoland. The southern frontier, separating the protectorate from Ashanti, is the Black Volta to a point a little above its junction with the White Volta. Thence the frontier turns south and afterwards east so as to include the Brunsi district in the protectorate, the frontier from the Black Volta below Yeji. The Territories include nearly all the country from the meridian of Greenwich to 3° W. and between 8° and 11° N., and cover an area of about 33,000 sq. m. Lying north of the great belt of primeval forest which extends parallel to the Guinea coast, the greater part of the protectorate consists of open country, well timbered, and much of it presenting a park-like appearance. There are also large stretches of grassy plains, and in the south-east an area of treeless steppe. The flora and fauna resemble those of Ashanti. The country is well watered, the Black Volta forming the west and southern frontier for some distance, while the White Volta traverses its central regions. Both rivers, and also the United stream, contain rapids which impede but do not prevent navigation (see VOLTA). The climate is much healthier than that of the coast districts, and the fever experienced is of a milder type. The rainfall is less than on the coast; the dry season lasts from November (when the harmattan begins to blow) to March. The mean temperature at Gambaga is 80° F., the mean annual rainfall 43 in. The inhabitants were officially estimated in 1907 to number ‘at least 1,000,000.’ The Dagomba, Dagarti, Grunshi, Kangarga, Moshi and the Ashanti tribes have also incursions from time to time by people, and Fula, Hausa and Yoruba have settled as traders or cattle raisers. A large number of the natives are Muslems, the rest are fetish worshippers. The tribal organization is maintained by the British authorities, who found comparatively little difficulty in putting an end to slave-raiding and gaining the confidence of the chiefs. Trained by British officers, the natives make excellent soldiers.

Danish and Dutch forts purchased.

The chief crops are maize, guinea-corn, millet, yams, rice, beans, groundnuts, tobacco and cotton. Cotton is grown in most parts of the protectorate, the soil and climate in many districts being very suitable for its cultivation. Rubber is found in the north-western regions. When the protectorate was assumed by Great Britain the Territories were singularly destitute of fruit trees. The British have introduced the orange, citron, lime, guava, mango and sour-sop, and among the plants the banana, pine-apple and papaow. A large number of vegetables and flowers have also been introduced by the administration.

Stock-raising is carried on extensively, and besides oxen and sheep there are large numbers of cattle and goats. The chief export is cocoa, daawe-dawwe (a favourite flavouring matter for soup among the Ashanti and other tribes) and shea-butter—the latter used in cooking and as an illuminant. The coffee exported consists of bulk coffee and the inferior qualities. A large proportion of the European goods imported is German and comes through Togoland. The administration levies a tax on traders’ cargoes, and is also interested in the cultivation of indigo, which is the chief local source of revenue. The revenue and expenditure of the Territories, as well as statistics of trade, are included in those of the Gold Coast.

Gold consists in quartz formation, chiefly in the valley of the Black Volta, and is found equally on the British and French sides of the frontier.

Towns.—The headquarters of the administration are at Tamale (Gambaga, 1), a town in the centre of the Dagomba country east of the White Volta and 200 m. N.E. of Kumasi. Its inhabitants are keen traders, and it forms a distributing centre for the whole protectorate. Gambaga, an important commercial centre and from 1867 to 1877 the seat of government, is in Mamprsav, the north-east corner of the protectorate and is 85 m. N.N.E. of Tamale. A hundred and forty miles due south of Gambaga is Salaga. This town is situated on the caravan route from the Hausa states to Ashanti, and has a considerable trade in kola-nuts, shea-butter and salt. On the White Volta, midway between Gambaga and Salaga, is the thriving town of Daboya. On the north-west Frontier are the two towns of Shama and Dodowa, an extensive trade with Bontoku, the capital of Jaman, and other places in the Ivory Coast colony. In all the towns the population largely consists of aliens—Hausa, Ashanti, Mandingos, &c.—and the settlers are mainly commercial, few settlers are engaged in agricultural pursuits. The climate and soil hinders the development of the country. The ancient caravan routes have been, however, supplemented by roads built by the British, who have further organized a service of boats on the Volta. Large cargo boats, chiefly laden with salt, ascend that river from Addamo to Yeji and Daboya. From Yeji, the port of Salaga, a good road, 150 m. long, has been made to Gambaga. There is also a river service from Yeji to Longoro on the Black Volta, the port of Kintampo, to the north of Ashanti. There is a complete telegraphic system connecting the towns of the protectorate with Kumasi and the Gold Coast ports.

History.—It was not until the last quarter of the 19th century that the country immediately north of Ashanti became known to Europeans. The first explorer was a French officer, M. J. Bonnat (one of the Kumasi captives, see ASHANTI) who, ascending the Volta, reached Salaga (1875–1876). In 1882 Captain R. La Trove Lonsdale, an officer in British colonial service, went further, visiting Yendi in the north and Bontoku in the west. Two years later Captain Brandon Kirby made his way to Kintampo. In 1887–1889 Captain L. G. Binger, a French officer, traversed the country from north to south. Therewith the whole region was visited by British, French and German political missions. Prominent among the British agents was Captain George E. Ferguson, a native of West Africa, who had previously explored northern Ashanti. Between 1892 and 1897 Ferguson concluded several treaties guarding British interests. In 1897 Lieutenant Henderson and Ferguson occupied Wa, where they were attacked by the sofus of Samory (see SENEGAL, § 3).
Henderson, who had gone to the sofa camp to parley, was held prisoner for some time, while Ferguson was killed. Meanwhile negotiations were opened in Europe to settle the spheres of influence of the respective countries. (The Anglo-French agreement of 1889 had fixed the boundaries of the hinterlands of the French colony of the Ivory Coast and the British colony of the Gold Coast as far as 6° N. only.) A period of considerable tension, arising from the proximity of British and French troops in the disputed territory, was ended by the signature of a convention in Paris (14th of June 1908), in which the western and northern boundaries were defined. The British abandoned their claim to the important town and district of Wagadugu in the north. In the following year (14th of November 1899) an agreement was signed with the French constabulary commanding the troops. He was succeeded by Col. A. H. Morris. In 1901 the Territories were made a distinct administration, under the jurisdiction of the governor of the Gold Coast colony. The government was at first of a semi-military character, but in 1907 a civilian staff was appointed to carry on the administration, and a force of armed constabulary replaced the troops which had been stationed in the protectorate and which were then disbanded. The prosperity of the country under British administration has been marked.

BIBLIOGRAPHY.—A good summary of the condition and history of the Territories is given in vol. 3, "West Africa," of the Historical Geography of the British Empire by C. P. Lucas (2nd ed., Oxford, 1900). For current information see the Gold Coast Civil Service List (London, yearly), the annual Blue Books published in the colony, and the annual Report issued by the Colonial Office, London. For fuller information consult the Report from the Select Committee on Africa (Western Coast) (London, 1865), a mine of valuable information; The Gold Coast, Past and Present, by G. Macdonald (London, 1898); History of the Gold Coast and Ashanti, by C. C. Reindorf, a native pastor (Basel, 1895); A History of the Gold Coast, by Col. A. B. Ellis (London, 1885); Wandering in the Unknown, by W. C. F. William (London, 1885); and in the Annual Report of the British West Africa Constabulary (London, 1885), both by Sir Richard Burton. Of the earlier books the most notable are The Golden Coast or a Description of Guiney together with a number of authentic and useful facts obtained by the author during his sojourn there (London, 1665), and A New and Accurate Description of the Coast of Guinea written (in Dutch) by Willem Bosman, chief factor for the Dutch at Elmina (Eng. trans., 2nd ed., 1721). For a complete survey of the colony see The British West-Indische Compagnie aan de Gold-Küste" by J. G. Doorman in Tijds Indische Taal-, Land- en Volksken, vol. 49 (1898). For ethnography, religion, law, etc., consult The Land of Fetish (London, 1883) and The Tshi-speaking Peoples of the West Coast of Africa (London, 1887), both by Col. A. B. Ellis; Fanti Customary Law (2nd ed., London, 1904) and Fanti Law Report (London, 1904), both by J. M. Sambah; The Sketch of the Forestry of West Africa by Sir Alfred Moloney (London, 1887) contains a comprehensive list of economic plants. See also Report on Economic Agriculture on the Gold Coast (Colonial Office Reports, No. 110, 1890), and Papers relating to the Gold Coast (London, 1889). The best map is that of Major F. G. Guggisberg, over 70 sheets, scale 1:250,000 (London, 1907–1909). There is a War Office map on the scale 1 : 1,000,000 in one sheet. See also the works quoted under ASHANTI.

For the Northern Territories see L. G. Binger, Du Niger au Golfe de Guinée (Paris, 1892), a standard authority; H. P. Northcott, British West Africa (London, 1890), a valuable compendium summarizing the then available information. Annual Reports on the protectorate are issued by the War Office, London. A map on the scale of 1 : 1,000,000 is issued by the War Office.

**GOLDEN,** a city and the county-seat of Jefferson county, Colorado, U.S.A., on Clear Creek (formerly called the Vasquez fork of the South Platte), about 14 m. W. by N. of Denver. Pop. (1900) 2152; (1910) 2477. Golden is a residential suburb of Denver, served by the Colorado & Southern, the Denver & Intermountain (electric), and the Denver & NorthWESTERN Electric railways. It is about 5700 ft. above sea-level. About 600 ft. above the city is Castle Rock, with an amusement park, and W. of Golden is Lookout Mountain, a natural park of 3400 acres. About 1 m. S. of the city is a state industrial school for boys, and in Golden is the Colorado State School of Mines (opened 1874), which offers courses in mining engineering and metallurgical engineering. The Independent Pyritic Smelter is at Golden, and among the city's manufactures are pottery, firebrick and tile, made from clays found near by, and flour. There are deposits of coal, copper and gold in the vicinity. Truck-farming and the growing of fruit are important industries in the neighbourhood. The first settlement here was a gold rush in 1859, established by a German named Tom Golden, one of the pioneer prospectors. The village was laid out in 1866, and Golden was incorporated as a town in 1865 and was chartered as a city in 1870. Golden was made the capital of Colorado Territory in 1862, and several sessions (or parts of sessions) of the Assembly were held here between 1864 and 1868, when the seat of government was formally established at Denver; the territorial offices of Colorado, however, were at Golden only in 1866–1867.

**GOLDEN BULL** (Lat. Bulla Aurea), the general designation of a large gold coin or ingot, either being a fragment of a gold seal or bulla, either owing to the intrinsic importance of its contents, or to the rank and dignity of the bestower or the recipient. The custom of thus giving distinction to certain documents is said to be of Byzantine origin, though if this be the case it is somewhat strange that the word employed as an equivalent for golden bull in Byzantine Greek should be the hybrid χρυσόβουλου (cf. Codinius Cyprus, d. μέγας λογοθέτης διαπίπτετι τά παρά τοῦ βασιλείου χρυσόβουλα προστάτικα καὶ χρυσόβουλα προς τέ θέγας, Σολομών, καὶ τοποθέτης; and Anna Comnena, Alexiad, lib. iii. διὰ χρυσόβουλα λόγον; lib. viii., χρυσόβουλον λόγον). In Germany the Golden Bull is mentioned under the reign of Henry I. the Fowler in Chronica Cassii, ii. 31, and the oldest German example, if it be genuine, dates from 983. At first the golden seal was formed after the type of a solid coin, but at a later date, while the golden surface presented to the eye was greatly increased, the seal was really composed of two thin metal plates filled in with wax. The number of golden bulls issued by the imperial chancery must have been very large; the city of Frankfort, for example, preserves no fewer than eight. The name, however, has become practically restricted to a few documents of unusual political importance, the golden bull of the Empire, the golden bull of Brabant, the golden bull of Hungary, and the golden bull of Milan—and of these the first is undoubtedly the Golden Bull par excellence. The main object of the Golden Bull was to provide a set of rules for the election of the German kings, or kings of the Romans, as they are called in this document. Since the informal establishment of the electoral college about a century before (see ELECTORS), various disputes had taken place about the right of certain princes to vote at the elections, these and other difficulties having arisen owing to the absence of any authoritative ruling. The spiritual electors, it is true, had exercised their votes without challenge, but far different was the case of the temporal electors. The families ruling in Saxony and in Bavaria had been divided into two main branches and, as the German states had not yet accepted the principles of primogeniture, it was uncertain which member of the divided family should vote. Thus, both the prince ruling in Saxo-Lauenburg and the prince ruling in Saxe-Wittenberg claimed the vote, and the two branches of the House of Wettin, settled in Saxony and in Thuringia, with the Rhenish palatinate, were similarly at variance, while the duke of Bavaria also claimed the vote at the expense of the king of Bohemia. Moreover, there had been several disputed and double elections to the German crown during the past century. In more than one instance a prince, chosen by a minority of the electors, had claimed to exercise the functions of king, and as often civil war had been the result. Under these circumstances the emperor Charles IV. determined by an
whatever the election of a king needs confirmation from the pope.

The Golden Bull was thus a great victory for the electors, but it weakened the position of the German king and was a distinct humiliation for the other princes and for the cities. The status of those rulers who did not obtain the electoral privilege was lowered by this very fact, and the regulations about the Pfarrbürgers, together with the prohibition of new leagues and associations, struck a severe blow at the cities. The German kings were elected according to the conditions laid down in the bull until the dissolution of the Empire. At first the document was known simply as the Lex Carolina; but gradually the name of the Book with the Golden Bull came into use, and the present epitaph title was sufficiently established by 1417 to be officially employed in a charter by King Sigismund. The original auto-

graph was committed to the care of the elector of Mainz, and it was preserved in the archives at Mainz till 1789. Official trans-

*GOLDEN BULL*

scripts were probably furnished to each of the seven electors at the time of the promulgation, and before long many of the other members of the Empire secured copies for themselves. The transaction, which is rather difficult to follow, is preserved in the state archives at Stuttgart; that of the elector of Cologne in the court library at Darmstadt, and that of the king of Bohemia in the imperial archives at Vienna. Berlin, Munich and Dresden also boast the possession of an electoral transcript; and the town of Kitzingen has a contemporary copy in its municipal archives. There appears, however, to be good reason to doubt the genuineness of most of these so-called original transcripts. But perhaps the best known example is that of Frankfort-on-

the-Mainz; a copy of this was given for the first time in 1568, and is adorned with a golden seal like the original. Not only was it regularly quoted as the indubitable authority in regard to the election of the emperors in Frankfort itself, but it was from time to time officially consulted by members of the Empire.

The manuscript consists of 43 leaves of parchment of medium quality, each measuring 365 mm. The only external marks of its age are wear and tear, but the document was not subjected to serious mutilation. The seal of the plate and wax type. On the obverse appears a figure of the emperor seated on his throne, with the sceptre in his right hand and the globe in his left; a shield, with the crowned imperial eagle, occupies the space on the one side of the throne, and a corresponding shield, with the crowned Bohemian lion with two tails, occupies the space on the other side; and round the margin of the bull runs, the words *Aurea Bulla* on the gate, and the circumspicium reads, *Roma caput mundi regi orbis feosa rotundae.* The original Latin text was published for the first time in 1476 and 1477, and a second edition by Anthonius Koburger (d. 1532) appeared at the same place in 1477. Since that time it has been frequently reprinted from various manuscripts and collections. M. Goldast gave a new translation of the text, and published it in his *Collectio constitutionum et legum imperialium* (Frankfort, 1615). Another is to be found in *De consiliis imperii* of O. Panvinius, and a third, of unknown history, is prefixed to the *Codex recentior Imperii* (Mainz, 1599, and again 1615). The Frankfort text appeared in 1742 as *Aurea Bulla secundum exemplar originalis Francfurtensis,* edited by W. C. Mutze, and the text is also found in J. J. Schmauss, *Corpus juris publici,* edited by R. von Hommel (Leipzig, 1794), and in the *Ausgewählte Urkunden zur Erläuterung der Verfassungsgeschichte Deutschlands im Mittelalter,* edited by W. Altmann and E. Kappel (Berlin, 1891, and again 1918). C. G. Biener's translation of this document, none of which, however, had any official authority, were published at Nuremberg about 1474, at Venice in 1476, and at Strassburg in 1585. Among the earlier commentators on the document are H. Canisius and J. Limmen, who wrote *In Auream Bullam* (Strassburg, 1662). The student will find a good account of the older literature on the subject in C. G. Biener's *Commentarius de origine et progressu juris publici Germaniae* (Leipzig, 1793). See also D. L. Oelenschläger, *Neue Erläuterungen der Goldenen Bulle* (Frankfort and Leipzig, 1760); H. G. von Thulemeyer, *De Bulla Aurea, Argentae,* &c. (Heidelberg, 1862); J. St. Pitter, *Historische Entwicklung der lateinischen Urkunden im deutschen Reich* (Leipzig, 1878), and O. Stobbe, *Geschichte der deutschen Rechtsquellen* (Brunswick, 1860-1864). Among the more modern works may be mentioned: E. Nerger, *Die Goldene Bulle nach ihrem Ursprung und ihrem Verbreite* (Strassburg, 1887), O. Hahn, *Ursprung und Bedeutung der Goldenen Bulle* (Breslau, 1903); and M. G. Schmidt, *Die staatsrechtliche Anwendung der Goldenen Bulle* (Halle, 1894). There is a valuable contribution to the subject in the Quellenregister zur Geschichte der deutschen Reichsverfassung, edited by K. Zeumer (Leipzig, 1904), and
GOLDEN-EYE—GOLDEN ROSE

another by O. Harnack in his Das Kurfürstentum Kolnium bis zur Mitte des 14. Jahrhunderts (Giesenhagen,1883). There is a view (p. 10) in the history of the bull in E. F. Henderson’s Select Historical Documents of the Middle Ages (London, 1903).

GOLDEN-EYE, a name indiscriminately given in many parts of Britain to two very distinct species of ducks, from the rich yellow colour of their irides. The commonest of them—the Anas fuligula of Linnaeus and Fuligula cristata of most modern ornithologists—is, however, usually called by English writers the tufted duck, while “golden-eye” is reserved in books for the A. clangula and A. glaucion of Linnaeus, who did not know that the birds he so named were but examples of the same species, differing only in age or sex; and to this day many fowlers perpetuate a like mistake, deeming the “Morillon,” which is the female or young male, distinct from the “Golden-eye,” or “Rattle-wings” (as from its noisy flight they often call it), which is the adult male. This species belongs to the group known as diving ducks, and is the type of the very well-marked genus Clangula of later systematists, which, among other differences, has the posterior end of the sternum prolonged so as to extend considerably over, and, we may not unreasonably suppose, protect the belly—a character possessed in a still greater degree by the mergansers (Merginae), while the males also exhibit in the extraordinarily developed bony labyrinth of their trachea and its midway enlargement another resemblance to the members of the same subfamily. The golden-eye, C. glaucion of modern writers, has its home in the northern parts of both hemispheres, whence in winter it migrates southward; but as it is one of the ducks that constantly resorts to hollow trees for the purpose of breeding it hardly transcends the limit of the Arctic forests on either continent. So well known is this habit to the people of the northern districts of Scandinavia, that they very commonly devise artificial nest-boxes for its accommodation and their own profit. Hollow logs of wood are prepared, the top and bottom closed and a hole cut in the side. These are affixed to the trunks of living trees in suitable places, at a convenient distance from the ground, and, being readily occupied by the birds in the breeding-season, are regularly robbed, first of the numerous eggs, and finally of the down they contain, by those who have set them up.

The adult male golden-eye is a very beautiful bird, mostly black above, but with the head, which is slightly crested, reflecting rich green lights, a large oval white patch under each eye and elongated white scapulars; the lower parts are wholly white and the feet bright orange, except the webs, which are dusky. In the female and young male, dark brown replaces the black, the cheek-spots are indistinct and the elongated white scapulars wanting. The golden-eye of North America has been by some authors deemed to differ, and has been named C. americana, but apparently on insufficient grounds. North America, however, has, in common with Iceland, a very distinct species, C. islandica, often called Barrow’s duck, which is but a rare straggler to the continent of Europe, and never, so far as known, to Britain. In Iceland and Greenland it is the only habitual representative of the genus, and it occurs from thence to the Rocky Mountains. In breeding habits it differs from the commoner species, not placing its eggs in tree-holes; but how far this difference is voluntary may be doubted, for in the countries it frequents trees are wanting. It is a larger and stouter bird, and in the male the white cheek-patches take a more crescentic form, while the head is glossed with purple rather than green, and the white scapulars are not elongated. The New World also possesses a third and still more beautiful species of the genus in C. albescus, known in books as the buffel-headed duck, and American fowlers as the “spirl-duck” and “butter-ball”—the form, perhaps not applied from its plumpness in diving, and the latter from its exceeding fatness in autumn. This is of small size, but the lustre of the feathers in the male is most brilliant, exhibiting a deep plum-coloured gloss on the head. It breeds in trees, and is supposed to have occurred more than once in Britain.

GOLDEN FLEECE, in Greek mythology, the fleece of the ram on which Phrixus and Helle escaped, for which see ARGONAUTS. For the modern order of the Golden Fleece, see KNIGHTHOOD and CHIVALRY, section Orders of Knighthood.

GOLDEN HORSE, the name of a body of Tatars who in the middle of the 13th century overran a great portion of eastern Europe and founded in Russia the Tatar empire of two khans, known as the Empire of the Golden Horde or Western Kipchaks. They invaded Europe about 1237 under the leadership of Batu Khan, a younger son of Jutj, eldest son of Jenghiz Khan, passed over Russia with slaughter and destruction, and penetrated into Silesia, Poland and Hungary, finally defeating Henry II., duke of Silesia, at Liegnitz in the battle known as the Wahlstatt on the 9th of April 1241. So costly was this victory, however, that Batu, finding he could not reduce Neustadt, retraced his steps and established himself in his magnificent tent (whence the name “golden”) on the Volga. The new settlement was known as Sir Orda (“Golden Camp,” whence “Golden Horde”). Very rapidly the powers of Batu extended over the Russian princes, and so long as the khane remained in the direct descent from Bátu nothing occurred to check the growth of the empire. The names of Bátu’s successors are Sartak (1256), Bereka (Baranka) (1256–1266), Mangó-Timur (1266–1280), Tuda Mängi (1280–1287), (?) Tüla Bugá (1287–1290), Tükít (1290–1312), Üzbee (1312–1340), Tim-Beg (1340), Ján-Beg (1340–1357). The death of Ján-Beg, however, threw the empire into confusion. The last of the Ján-Begs, Edinburgh (1357), after which two rulers, calling themselves sons of Ján-Beg occupied the throne during one year. From this time (1359) till 1378 no single ruler held the whole empire under control, various members of the other branches of the old house of Júji assuming the title. At last in 1378 Tükítamish of the Eastern Kipchaks, succeeded in ousting all rivals, and establishing himself as ruler of eastern and western Kipchak. For a short time the glory of the Golden Horde was renewed, until it was finally crushed by Timur in 1395.

See further MONGOLS and RUSSIA; Sir Henry Howorth’s History of the Mongol Empire (1888); S. Karasarz, Die Dynastie der Goldenen Horde (1894), pp. 222–231; for the relations of the various descendants of Jenghiz, see Stockvis, Manuel d’histoire, vol. i. chap. ix. table 7.

GOLDEN ROD, in botany, the popular name for Solidago virgaurea (natural order Compositae), a native of Britain and widely distributed in the north temperate region. It is an old-fashioned border-plant flowering from July to September, with an erect, sparingly-branched stem and small bright-yellow clustered heads of flowers. It grows well in common soil and is readily propagated by division in the spring or autumn of the 16th century.

GOLDEN ROSE, an ornament made of wrought gold and set with gems, generally sapphires, which is blessed by the pope on the fourth (Laetare) Sunday of Lent, and usually afterwards sent as a mark of special favour to some distinguished individual, to a church, or a civil community. Formerly it was a single rose of wrought gold, coloured red, but the form finally adopted is a thorny branch with leaves and flowers, the petals of which are decked with gems, surmounted by one principal rose. The origin of the custom is obscure. From very early times popes have given away a rose on the fourth Sunday of Lent, whence the name Dominicana Rose, sometimes given to this feast. The practice of blessing and sending some such symbol (e.g. eulogiae) goes back to the earliest Christian antiquity, but the use of the rose itself does not seem to go farther back than the 11th century. According to some authorities it was used by Leo IX. (1049–1054), but in any case Pope Urban II. sent one to Fulk of Anjou during the preparations for the first crusade. Pope Urban V., who sent a golden rose to Joanna of Naples in 1366, is alleged to have been the first to determine that one should be consecrated annually. Beginning with the 16th century there went regularly with the rose a letter relating the reasons why it was sent, and reciting the merits and virtues of the receiver. When the change was made from the form of the simple rose to the branch is uncertain. The rose sent by Innocent IV. in 1244 to Count Raymond Berengar IV. of Provence was a simple flower without any accessory ornamentation, while the one given by Benedict XI. in 1303 to the
church of St Stephen at Perugia consisted of a branch garnished with five open and two closed roses enriched with a sapphire, the whole having a value of seventy ducats. The value of the gift varied according to the character or rank of the recipient. John XXII. gave away some weighing 12 oz., and worth from £350 to £375. Among the recipients of this honour have been Henry VI. of England, 1446; James III. of Scotland, on whom the rose (made by Jacopo Magnolii) was conferred by Innocent VIII.; James IV. of Scotland; Frederick the Wise, elector of Saxony, who received a rose from Lco X. in 1358; Henry VIII. of England, who received three, the last from Clement VII. in 1534 (each had nine branches, and rested on different forms of feet, one on oxen, the second on acorns, and the third on lions); Francis I. received a large example from Julius II. of the republic of Lucca, so favoured by Pius IV., in 1564; the Lateran Basilica by Pius V. three years later; the sanctuary of Loreto by Gregory XIII. in 1584; Maria Theresa, queen of France, who received it from Clement IX. in 1668; Mary Casimir, queen of Poland, from Innocent XI. in 1684 in recognition of the deliverance of Vienna by her husband, John Sobieski; Benedict XIII. (1726) presented one to the cathedral of Capua, and in 1833 it was sent by Gregory XVI. to the church of St Mark's, Venice. In more recent times it was sent to Napoleon. It is said of France, the empress Eugenie, and the queen, Isabella II., of Spain, Christina (1886) and Victoria (1906) of Spain. The gift of the golden rose used almost invariably to accompany the coronation of the king of the Romans. If in any particular year no one is considered worthy of the rose, it is laid up in the Vatican.

Some of the most famous Italian goldsmiths have been employed in making the earlier roses; and such intrinsically valuable objects have, in common with other priceless historical examples of the goldsmiths' art, found their way into the melting-pot. It is, therefore, not surprising that the number of existing historic specimens is very small. These include one of the 14th century in the Cluny Museum, Paris, believed to have been sent by Clement V. to the prince-bishop of Basel; another conferred in 1458 on his native city of Siena by Pope Pius II.; and the rose bestowed upon Siena by Alexander VII., a son of that city, which is depicted in a procession in a fresco in the Palazzo Pubblico at Siena. The surviving roses of more recent date include that presented by Benedict XIII. to Capua cathedral; the rose conferred on the empress Caroline by Pius VII., 1819, at Vienna; one of 1833 (Gregory XVI.) at St Mark's, Venice; and one of 1871. Pius XII.'s rose sent to Queen Christina of Spain, which is at Madrid.

GOLDEN RULE—GOLDFINCH

The term applied in all European languages to the rule of conduct laid down in the New Testament (Matthew vii. 12 and Luke vi. 31), " whatsoe'er ye would that men should do to you, do ye even so to them, for this is the law and the prophets." This principle has often been stated as the fundamental precept of social morality. It is sometimes put negatively or passively, " do not that to another which you would not have done to thyself " (cf. Hobes, Leviathan, xv. 79, xvii. 85), but it should be observed that in this form it implies merely alternative views. In the other precept in ordinary application is part of a hedonistic system of ethics, the criterion of action being strictly utilitarian in character.

GOLDFIELD, a town and the county-seat of Esmeralda county, Nevada, U.S.A., about 170 m. S.E. of Carson City. Pop. (1910, U.S. census) 4838. It is served by the Tonopah & Goldfield, Las Vegas & Tonopah, and Tonopah & Tidewater railways. The town lies in the midst of a desert abounding in high-grade gold ores, and is essentially a mining camp. The discovery of gold at Tonopah about 28 m. N. of Goldfield, in 1900 was followed by its discovery at Goldfield in 1902 and 1903; in 1904 the Goldfield district produced about 800 tons of ore, which yielded $2,300,000 worth of gold, or 30% of that of the state. This remarkable production caused Goldfield to grow rapidly, and it soon became the largest town in the state. In addition to the mines, there are large reduction works. In 1907 Goldfield became the county-seat. The gold output in 1907 was $8,498,996; in 1908, $8,860,251. Soon after mining on an extensive scale began, the miners organized themselves as a local branch of the Western Federation of Miners, and in this branch the great strike of 1907-1908 received Tonopah and Goldfield either the name of "the mine towns." Between this branch and the mine-owners there arose a series of more or less serious differences, and there were several set strikes—in December 1906 and January 1907, for higher wages; in March and April 1907, because the mine-owners refused to discharge carpenters who were members of the American Federation of Labour, but did not belong to the Western Federation of Miners or to the Industrial Workers of the World affiliated with it, this last organization being, as a result of the strike, forced to recognize Goldfield; in August and September 1907, because a rule was introduced at it, some of the miners requiring miners to change their clothing before entering and after leaving the mines,—a rule made necessary, according to the operators, by the wholesale stealing (in miners' parlance, " high-grading ") of the very valuable ore (some of it valued at as high as $20 a pound); and in November and December 1907, because some of the mine-owners, avowedly on account of the hard times, adopted a system of paying in cashier's checks. Excepting occasional attacks upon non-union workmen, or upon persons not noted not to be in sympathy with the miners' union, there had been no serious disturbance in Goldfield; but in December 1907, Governor Sparks, at the instance of the mine-owners, appealed to President Roosevelt to send Federal troops to Goldfield, on the ground that the situation there was ominous, that destruction of life and property seemed probable, and that the state had no militia and would be powerless to maintain order. President Roosevelt thereupon (December 4th) ordered General Frederick Funston, commanding the Division of California, at San Francisco, to proceed with 300 Federal troops to Goldfield. The troops arrived in Goldfield on the 6th of December, and less than a week after their appearance, one of the Governor's men announced that no members of the Western Federation of Miners would thereafter be employed in the mines. President Roosevelt, becoming convinced that conditions had not warranted Governor Sparks' appeal for Federal assistance, but that the immediate withdrawal of the troops might nevertheless lead to serious disorders, consented that they should remain for a short time on condition that the state should immediately organize an adequate militia or police force. Accordingly, a special meeting of the legislature was immediately called, a state police force was organized, and on the 7th of March 1908 the troops were withdrawn. Thereafter work was gradually resumed in the mines, the contest having been won by the mine-owners.

GOLDFINCH (Ger. Goldfink), the Fringilla carduelis of Linnaeus and the Carduelis elegans of later authors, an extremely well-known bird found over the greater parts of Europe and North Africa, and eastwards to Persia and Turkestan. Its gay plumage is matched by its sprightly nature; and together they make it one of the most favourite cage-birds among all classes. As a songster it is indeed surpassed by many other species; but docility and ready attachment of master or mistress make up for any defect in its vocal powers. In some parts of England the trade in goldfinches is very considerable. In 1880 Mr. Hussey reported (Zool., p. 7144) the average annual captures near Worthing to exceed 11,000 dozens—nearly all being cock-birds; and a witness before a committee of the House of Commons in 1873 stated that, when a boy, he could take forty
GOLDFISH—GOLDIE

The domestication of the goldfish by the Chinese dates back from the highest antiquity, and they were introduced into Japan at the beginning of the 16th century; but the date of their importation into Europe is still uncertain. The great German ichthyologist, M. E. Bloch, thought he could trace it back in England to the reign of James I., whilst other authors fix the date at 1691. It appears certain that they were brought to France, only much later, as a present to Mme de Pompadour, by the de Goucours, the historians of the mistresses of Louis XV., have failed to trace any records of this event. The fish has since spread over a considerable part of Europe, and in many places it has reverted to its wild condition. In many parts of south-eastern Asia, in Mauritius, in North and South Africa, in Madagascar, in the Azores, it has become thoroughly acclimatized, and successfully competes with the indigenous fresh-water fishes. It will not thrive in rivers; in large ponds it readily reverts to the coloration of the original wild stock. It flourishes best in small tanks and ponds, in which the water is constantly changing and does not freeze; in such localities, and with a full supply of food, which consists of weeds, crumbs of bread, beet-worms, small crustaceans and insects, it attains a length of from 6 to 12 in., breeding readily, sometimes at different times of the same year.

GOLDFUSS, GEORG AUGUST (1782-1848), German palaeontologist, born at Thurnau near Bayreuth on the 18th of April 1782, was educated at Erlangen, where he graduated Ph.D. in 1804 and became professor of zoology in 1818. He was subsequently appointed professor of zoology and mineralogy in the university of Bonn. Aided by Count G. Münster he issued the important Petaeidae Germaniae (1826-1832) as a work in which he intended to illustrate the invertebrate fossils of Germany, but it was left incomplete after the sponges, corals, crinoids, echinids and part of the mollusca had been figured. Goldfuss died at Bonn on the 2nd of October 1848.

GOLDIE, SIR GEORGE DASHWOOD TAUBMAN (1846-1920), English administrator, the founder of Nigeria, was born on the 26th of May 1846 at the Nunnery in the Isle of Man, being the youngest son of Lieut.-Colonel John Taubman Goldie-Taubman, speaker of the House of Keys, by his second wife Caroline, daughter of John E. Hoveden of Hemingford, Cambridgeshire. Sir George resumed his paternal name, Goldie, by royal licence in 1887. He was educated at the Royal Military Academy, Woolwich, and for about two years held a commission in the Royal Engineers. He travelled in all parts of Africa, gaining an extensive knowledge of the continent, and first visited the country of the Niger in 1877. He conceived the idea of adding to the British empire the little known regions of the lower and middle Niger, and for over twenty years his efforts were devoted to the realization of this conception. The method by which he determined to work was the revival of government by chartered companies within the empire—a method supposed to be buried with the East India Company. The first step was to combine all British commercial interests in the Niger, and this he accomplished in 1879 when the United African Company was formed. In 1881 Goldie sought a charter from the imperial government (the 2nd Gladstone ministry). Objections of various kinds were raised. To meet them the capital of the company (renamed the National African Company) was increased from £125,000 to £1,000,000, and great energy was displayed in founding stations on the Niger. At this time French traders, encouraged by Gambetta, established themselves on the lower river, thus rendering it difficult for the company to obtain territorial rights; but the Frenchmen were bought out in 1884, so that at the Berlin conference on West Africa in 1885 Mr Goldie, present as an expert on matters relating to the river, was able to announce that on the lower Niger the British flag alone flew. Meantime the Niger coast line had been placed under British protection. Through Joseph Thomson, David McIntosh, D. W. Sargent, J. Flint, William Wallace, E. Dangerfield and numerous other agents, over 400 political treaties—drawn up by Goldie—were made with the chiefs of the lower Niger and the Hausa states. The scruples of the British government being overcome, a charter was at length granted

dozens in a morning near Brighton. In these districts and others the number has become much reduced, owing doubtless in part to the fatal practice of catching the birds just before or during the breeding-season; but perhaps the strongest cause of their growing scarcity is the constant breaking-up of waste lands, and the extirpation of weeds (particularly of the order Compositae) essential to the improved system of agriculture; for in many parts of Scotland, East Lothian for instance, where goldfinches were once as plentiful as sparrows, they are now only rare stragglers, and yet there they have not been thinned by netting. Though goldfinches may occasionally be observed in the coldest weather, incomparably the largest number leave Britain in autumn, returning in spring, and resorting to gardens and orchards to breed, when the lively song of the cock, and the bright yellow wings of both sexes, quickly attract notice. The nest is a beautifully neat structure, often placed at no great height from the ground, but generally so well hidden by the leafy bough on which it is built as not to be easily found, until, the young being hatched, the constant visits of the parents reveal its site. When the broods leave the nest they move into the more open country, and frequenting pastures, commons, heaths and downs, assemble in large flocks towards the end of summer. Eastward of the range of the present species its place is taken by its congener C. caniceps, which is easily recognized by wanting the black hood and white ear-coverts of the British bird. Its home seems to be in Central Asia, but it moves southward in winter, being common at that season in Cashmere, and is not unfrequently brought for sale to Calcutta. The position of the genus Carduelis in the family Fringillidae is not very clear. Structurally it would seem to have some relation to the siskins (Chrysothrix), though the members of the two groups have very different habits, and perhaps its nearest kinship lies with the hawfinches (Coccothraustes). See FINCH.

GOLDFISH (Cyprinus or Carassius auratus), a small fish belonging to the Cyprinid family, a native of China but naturalized in other countries. In the wild state its colours do not differ from those of a Crucian carp, and like that fish it is tenacious of life and easily domesticated. Albino seems to be rather common; and as in other fishes (for instance, the tench, carp, eel, flounder), the colour of most of these albino is a bright orange or golden yellow; occasionally even this shade of colour is lost, the fish being more or less pure white or silver. The Chinese have domesticated these albino for a long time, and by careful selection have succeeded in propagating all those strange varieties, and even monstrosities, which appear in every domestic animal. In some individuals the dorsal fin is only half its normal length, in others entirely absent; in others the anal fin has a double spine; in others all the fins are of nearly double the usual length. The snout is frequently malformed, giving the head of the fish an appearance similar to that of a bull-dog. The variety most highly prized has an extremely short snout, eyes which almost wholly project beyond the orbit, no dorsal fin, and a very long three- or four-lobed caudal fin. (Telescope-fish.)
(July 1886), the National African Company becoming the Royal Niger Company, with Lord Aberdare as governor and Goldie as vice-governor. In 1895, on Lord Aberdare’s death, Goldie became governor of the company, whose destinies he had guided throughout. The building up of Nigeria as a British state had to be carried on in face of further difficulties raised by French travellers with political missions, and also in face of German opposition. From 1884 to 1890, Prince Bismarck was a persistent antagonist, and the strenuous efforts had to be made to secure for Germany the basin of the lower Niger and Lake Chad were even more dangerous to Goldie’s schemes of empire than the ambitions of France. Herr E. R. Flegel, who had travelled in Nigeria during 1882–1884 under the auspices of the British company, was sent out in 1885 by the newly-formed German Colonial Society to secure treaties for Germany, which had established itself at Cameroon. After Flegel’s death in 1886 his work was continued by his companion Dr Staudinger, while Herr Hoeningberg was despatched to stir up trouble in the occupied portions of the company’s territory, or, as he expressed it, “to burst up the charter.” He was finally arrested at Onitsha, and, after trial by the company’s supreme court at Asaba, was expelled the country. Prince Bismarck then sent out his nephew, Herr von Puttkamer, as German consul-general to Nigeria, with orders to report on this affair, and when this report was published in a White Book, Bismarck demanded heavy damages from the company. Meanwhile Bismarck maintained constant pressure on the British government to compel the Royal Niger Company to a division of spheres of influence, whereby Great Britain built up the following year the islands of Fernando Po beyond the basin of the Niger, which became in the process of time the Anglo-German littoral, a part of the company’s territory. But he fell from power in March 1890, and in July following Lord Salisbury concluded the famous “Heligoland” agreement with Germany. After this event the aggressive action of Germany in Nigeria entirely ceased, and the door was opened for a final settlement of the Nigeria-Cameroon frontiers. These negotiations, which resulted in an agreement in 1893, were initiated by Goldie as a means of arresting the advance of France into Nigeria from the direction of the Congo. By conceding to Germany a long but narrow strip of territory between Adamawa and Lake Chad, to which she had no treaty claims, a barrier was raised against French expeditions, semi-military and semi-exploratory, which sought to enter Nigeria from the east. Later French efforts at aggression were made from the western or Dahomeyan side, despite an agreement concluded with France in 1890 respecting the northern frontier.

The hostility of certain Fula princes led the company to despatch, in 1897, an expedition against the Mahommadian states of Napé and Illorin. This expedition was organized and personally directed by Goldie and was completely successful. Internal peace was thus secured, and in the following year the routes with France in regard to the frontier line became acute, and compelled the intervention of the British government. In the negotiations which ensued Goldie was instrumental in preserving for Great Britain the whole of the navigable stretch of the lower Niger. It was, however, evidently impossible for a chartered company to hold its own against the state-supported protectorates of France and Germany, and in consequence, on the 1st of January 1900, the Royal Niger Company transferred its territories to the British government for the sum of £865,000. The ceded territory together with the small Niger Coast Protectorate, already under imperial control, was formed into the two protectorates of northern and southern Nigeria (see further NIGERIA).

In 1903–1904, at the request of the Chartered Company of South Africa, Goldie visited Rhodesia and examined the situation in connexion with the agitation for self-government by the Rhodesians. In 1902–1903 he was one of the royal commissioners who inquired into the military preparations for the war in South Africa (1899–1902) and into the operations up to the occupation of Pretoria, and in 1905–1906 he was a member of the royal commission which investigated the formation of the Imperial Defence Committee after peace had been made. In 1905 he was elected president of the Royal Geographical Society and held that office for three years. In 1908 he was chosen an alderman of the London County Council. Goldie was created K.C.M.G. in 1887, and a privy councillor in 1898. He became an F.R.S., honorary D.C.L. of Oxford University (1897) and honorary L.L.D. of Cambridge (1897). He married in 1870 Matilda Catherine (d. 1888), daughter of John William Elliott of Wakefield.

GOLDING, ARTHUR (c. 1536–c. 1603), English translator, son of John Golding of Belchamp St Paul and Halted, Essex, one of the auditors of the exchequer, was born probably in London about 1536. His half-sister, Margaret, married John de Vere, 16th earl of Oxford. In 1549 he was already in the service of Protector Somerset, and the statement that he was educated at Queen’s College, Cambridge, lacks corroboration. He seems to have resided for some time in the house of Sir William Cecil, in the Strand, with his nephew, the poet, the 17th earl of Oxford, whose receiver he was, for two of his dedications are dated from Cecil House. His chief work is his translation of Ovid. The First Book of Books of P. Ovidius Nasos worke, entituled Metamorphosis, translated oute of Latin into Englishe meier (1563), was supplemented in 1567 by a translation of the fifteen books. Strangely enough the translator of Ovid was a man of strong Puritan sympathies, and he translated many of the works of Calvin. To his version of the Metamorphoses he prefixed a long metrical explanation of his reasons for considering it a work of edification. He sets forth the moral which he supposes to underlie certain of the stories, and shows how the pagan machinery may be brought into line with Christian thought. It was from Golding’s pages that many of the Elizabethans drew their knowledge of classical mythology, and there is little doubt that Shakespeare was well acquainted with the book. Golding translated also the Commentaries of Caesar (1565), Calvin’s commentaries on the Psalms (1571), his sermons on the Galatians and Ephesians, on Deuteronomy and the book of Job, Theodore Beza’s Tragedie of Abrahams Sacrifice (1577) and the De Beneficiis of Seneca (1578). He completed a translation begun by Sidney from Philippe de Mornay, A Woorke concerning the Trewness of the Christian Religion (1604). His only original work is a prose Discourse on the earthquake of 1580, in which he saw a judgment of God on the wickedness of his time. He inherited three considerable estates in Essex, the greater part of which he sold in 1591. The last trace we have of Golding is contained in an order dated the 25th of July 1605, giving him licence to print certain of his works.

GOLDINGEN (Lettish, Kuldīge), a town in Russia, in the government of Courland, 55 m. by rail N.E. of Libau, and on Windau river, in 60° 38’ N. and 20° E. Pop. (1897) 9733. It has woolen mills, needle and match factories, breweries and distilleries, a college for teachers, and ruins of a castle of the Teutonic Knights, built in 1248 and used in the 17th century as the residence of the dukes of Courland.

GOLDMARK, KARL (1832–_), Hungarian composer, was born at Keszthely-am-Plattensee, in Hungary, on the 18th of May 1832. His father, a poor cantor in the local Jewish synagogue, was unable to assist to any extent financially in the development of his son’s talents. Yet in the household much music was made, and on a cheap violin and home-made flute, constructed by Goldmark himself from reeds cut from the riverbank, the future composer gave rein to his musical ideas. His talent was fostered by the village schoolmaster, by whose aid he was able to enter the music-school of the Oedenburger Verein. Here he remained but a short time, his success at a school concert finally determining his parents to allow him to devote himself entirely to music. In 1844, then, he went to Vienna, where Jansa took up his cause and eventually obtained for him admission to the conservatorium. For two years Goldmark worked under Jansa at the violin, and on the outbreak of the revolution, after studying all the orchestral instruments he obtained an engagement in the orchestra at Raab. There, on the capitulation of Raab, he was to have been shot for a spy, and was only saved by the timely interposition of a friend of his, Professor Hora. In 1850 Goldmark left Raab for Vienna, where from his friend Mittrich he obtained his first real knowledge of the classics. There, too, he devoted himself to composition. In 1857 Goldmark,
who was then engaged in the Karl-theater hand, gave a
concert of his own works with such success that his first quartet
attracted very general attention. Then followed the "Sakun-
tala" and "Penthesilae" overtures, which show how Wagner's
influence had supervened upon his previous domination by
Mendelssohn, and the delightful "Ländliche Hochzeit" sym-
phony, which carried his fame abroad. Goldmark's reputation
was now made, and very largely increased by the production
at Vienna in 1875 of his first and best opera, Die Königin von
Saba. Over this opera he spent seven years. Its popularity
was however, in November
1889, also crystallized by Martin, much of which has been re-
written since then. A third opera, a version of Dickens's Cricket
on the Hearth, was given by the Royal Carl Rosa Company
in London in 1900. Goldmark's chamber music has not made
much lasting impression, but the overtures "Im Frühling," "Prometheus Bound," and "Sapho" are fairly well known.
A "programme" seems essential to him. In opera he is most
certainly at his best, and as an orchestral colourist he ranks
among the very highest.

C. Goldoni (1707-1793), Italian dramatist, the real
founder of modern Italian comedy, was born at Venice, on the
25th of February 1707, in a fine house near St Thomas's church.
His father Giulio was a native of Modena. The first playthings
of the future writer were puppets which he made dance; the
first books he read were plays,—among others, the comedies of
the Florentine Cigognini. Later he received a still stronger
impression from the Mandragore of Machiaveli. At eight years
old he had tried to sketch a play. His father, meanwhile, had
taken his degree in medicine at Rome and fixed residence in
Perugia, where he made his son join him; but, having soon
quarrelled with his colleagues in medicine, he departed for
Chioggia, leaving his son to the care of a philosopher, Professor
Caldini of Rimini. The young Goldoni soon grew tired of his
life at Rimini, and ran away with a Venetian company of players.
He began to study law at Venice, went then to continue the
same pursuit at Pavia, but at that time he was studying the
Greek and Latin comic poets much more and much better than
books about law. "I have read over again," he writes in his own
Memoirs, "the Greek and Latin poets, and I have told to
myself that I should like to imitate them in their style, their
plots, their precision; but I would not be satisfied unless I
succeeded in giving more interest to my works, happier issues
to my plots, better drawn characters and more genuine comedy."
For a satire entitled Il Coloso, which attacked the cabeza of
several families of Pavia, he was driven from that town, and
went first to study with the jurisconsult Morelli at Udine, then
to take his degree in law at Modena. After having worked
some time as clerk in the chanceries of Chioggia and Feltrè,
his father being dead, he went to Venice, to exercise there his
profession as a lawyer. But the wish to write for the stage
was always strong in him, and he tried to do so; he made,
however, a mistake in his choice, and began with a tragedy,
Amolasusica, which was represented at Milan and proved a failure.
In 1734 he wrote another tragedy, Belisario, which, though not
much better, changed nevertheless to please the public. This
first success encouraged him to write other tragedies, some of
which were well received; but the author himself saw clearly
that he had not yet found his proper sphere, and that a radical
dramatic reform was absolutely necessary for the stage. He
wished to create a characteristic comedy in Italy, to follow the
example of Molleiro, and to delineate the realities of social life
in as natural a manner as possible. His first essay of this kind
was Momolo Cortesan (Momolo the Courtier), written in the
Venetian dialect, and based on his own experience. Other
plays followed,—some interesting from their subject, others
from the characters; the best of that period are,—Le Trentodue
Disgrazie d' Arlescchio, La Notte critica, La Bancarotta,
La Donna di Caro. Having, while consul of Genoa at Venice,
been irritated by a captain of Raguza, he founded on this his play L'Impostore.
At Leccehino he made the acquaintance of the
comedian Medebac, and followed him to Venice, with his company,
for which he began to write his best plays. Once he promised to
write sixteen comedies in a year, and kept his word; among the
sixteen are some of his very best, such as Il Caffè, Il Bugiardio,
La Pamelia. When he left the company of Medebac, he passed
over to that maintained by the patrician Vendramin, continuing
to write with the greatest facility. In 1761 he was called to
Paris, and before leaving Venice he wrote Una delle ulteme sere
di Carnevale (One of the Last Nights of Carnival), a Regency
play, but it was not produced for many years. At the end of
the representation of this play, the theatre resounded with
applause, and with shouts expressive of good wishes. Goldoni,
at this proof of public sympathy, wept as a child. At Paris,
during two years, he wrote comedies for the Italian actors; then
he taught Italian to the royal princesses; and for the wedding
of Louis XVI. and Marie Antoinette he wrote in French one
of his best comedies, Le Bourru bienfaisant, which was a great
success. When he retired from Paris to Versailles, the king
had him a gift of 6000 francs, and fixed on him an annual
tuition of 1200 francs. He was at Versailles he wrote his Memoirs,
which occupied him till he reached his eightieth year. The
Revolution deprived him all at once of his modest pension, and
reduced him to extreme misery; he dragged on his unfortunate
existence till 1793, and died on the 6th of February. The
day after, on the proposal of Andre Chénier, the Convention agreed
to give the pension back to the poet; and as he had already
died, a reduced allowance was granted to his widow.

Golds, a Mongolo-Tatar people, living on the Lower Amur
in south-eastern Siberia. Their chief settlements are on the right
bank of the Amur and along the Sungari and Usuri rivers. In
physique they are typically Mongolic. Like the Chinese they
wear a pigtail, and from them, too, have learnt the art of silk
embroidery. The Golds live almost entirely on fish, and are
excellent boatmen. They keep large herds of swine and dogs,
which live, like themselves, on fish. Geese, wild duck, eagles,
bears, wolves and foxes are also kept in menageries. There is
much reverence paid to the eagles, and hence the Manchus call
the Golds "Eaglets." Their religion is Shamanism.

Goldsboro', a city and the county-seat of Wayne county,
North Carolina, U.S.A., on the Neuse river, about 50 m. S.E. of
Raleigh. Pop. (1890) 4017; (1900) 3877 (2520 negroes); (1910)
6107. It is served by the Southern, the Atlantic Coast Line
and the Norfolk & Southern railways. The surrounding country
produces large quantities of tobacco, cotton and grain,
and trucking is an important industry, the city being a distributing
point for strawberries and various kinds of vegetables. The
city's manufactures include cotton goods, knit goods, cotton-
seed oil, agricultural implements, lumber and furniture. Golds-
boro is the seat of the Eastern insane asylum (for negroes) and
of an Odd Fellows' orphan home. The municipality owns
and operates its water-works and electric-lighting plant.
Goldsboro was settled in 1856, and was first incorporated in 1854.
In the course of the American Civil War, 1861-1865, Goldsboro
was the point of junction of the Union armies under generals Sherman and Schofield, previous to the final advance to Greensboro.

Goldschmidt, Hermann (1802-1866), German painter
and astronomer, was the son of a Jewish merchant, and was born
at Frankfort on the 17th of June 1802. He for ten years assisted
his father in his business; but, his love of art being awakened
while journeying in Holland, he in 1832 began the
study of painting at Munich under Cornelius and Schnorr, and
in 1835 established himself at Paris, where he painted a number
of pictures of more than average merit, among which may be
mentioned the "Cumaean Sibyl" (1844); an "Offering to
VENUS" (1845); a "View of Rome" (1849); the "Death of Romeo and Juliet" (1857); and several Alpine landscapes. In 1847 he began to devote his attention to astronomy; and from 1853 to 1861 he discovered fourteen asteroids between Mars and Jupiter, on which account he received the grand astronomical prize from the Academy of Sciences. His observations of the protuberances on the sun, made during the total eclipse on the 10th of July 1860, are included in the work of Mädler on the eclipse, published in 1861. Goldschmidt died at Fontainebleau on the 26th of August 1866.

GOLDSMID, the name of a family of Anglo-Jewish bankers sprung from Aaron Goldsmid (d. 1782), a Dutch merchant who settled in England about 1763. Two of his sons, Benjamin College, London, and his father, Benjamin left the business in 1777 as bill-brokers in London, and soon became great powers in the money market, during the Napoleonic war, through their dealings with the government. Abraham Goldsmid was in 1810 joint contractor with the Barings for a government loan, but owing to a depreciation of the script he was forced into bankruptcy and committed suicide. His brother, in a fit of depression, had similarly taken his own life two years before. Both were noted for their public and private generosity, and Benjamin had a part in founding the Royal Naval Asylum. Abraham left London and Abraham Madler (214 GOLDSMITH, 1840-41, 1847), a son of the above, married Henry Edward Goldsmid (1812-1853), an eminent Indian civil servant, son of Edward Goldsmid; his reform of the revenue system in Bombay, and introduction of a new system, established after his death, through his reports in 1840-47, and his devoted labour in land-surveys, were of the highest importance to western India, and established his memory there as a public benefactor.

GOLDSMITH, LEWIS (c. 1763-1846), Anglo-French pamphлист, of Portuguese-Jewish extraction, was born near London about 1763. Having published in 1801 The Crimes of Cabinets, or a Review of the Plans and Aggressions for Annihilating the Liberties of France, and the Dismemberment of her Territories, an attack on the military policy of Pitt, he moved, in 1802, from England to Paris. Talleyrand introduced him to Napoleon, who arranged for him to establish in Paris an English tri-weekly, the Argus, which was to review English affairs from the French point of view. According to his own account, he was in 1803 entrusted with a mission to obtain from the head of the French royal family, afterwards Louis XVIII., a renunciation of his claims to the throne of France, in return for the throne of Poland. The offer was declined by the French government, and Goldsmith was instructed to kidnap Louis and kill him if he resisted, but, instead of executing these orders, he revealed the plot. He was, nevertheless, employed by Napoleon on various other secret service missions till 1807, when his Republican sympathies began to wane. In 1809 he returned to England, where he was at first imprisoned but soon released; and he became a notary in London. In 1814, being now violently anti-republican, he founded a Sunday newspaper, the Anti-Gallican Monitor and Anti-Coriscian Chronicle, subsequently known as the British Monitor, in which he denounced the French Revolution. In 1811 he proposed that a public subscription should be raised to put a price on Napoleon's head, but this suggestion was strongly repudiated by the British government. In the same year he published Secret History of the Cabinet of Bonaparte and Recueil des manifestes, or a Collection of the Decrees of Napoleon Bonaparte, and in 1812 Secret History of Bonaparte's Diplomacy. Goldsmith alleged that in the latter year he was offered £20,000 by Napoleon to discontinue his attacks. In 1815 he published An Appeal to the Governments of Europe on the Necessity of bringing Napoleon, Bona parte a Public Tyrant, and he again settled down in Paris, and in 1832 published his Statistics of France. His only child, Georgiana, became, in 1837, the second wife of Lord Lyndhurst. He died in Paris on the 6th of January 1846.

GOLDSMITH, OLIVER (1728-1774), English poet, playwright, novelist and man of letters, came of a Protestant and Saxon family which had long been settled in Ireland. He is usually said to have been born at Pallas or Pallasmore, Co. Longford; but recent investigators have contended, with much
show of probability, that his true birthplace was Smith-Hill House, Elphin, Roscommon, the residence of his mother's father, the Rev. Oliver Jones. His father, Charles Goldsmith, lived at Pallas, supporting with difficulty his wife and children on what he could earn, partly as a curate and partly as a farmer.

When Oliver was a child he was presented to the living of Kilkenny West, in the county of West Meath. This was worth about £200 a year. The family accordingly quitted their cottage at Pallas for a spacious house on a frequented road, near the village of Lissoy. Here the boy was taught his letters by a relative and dependent, Elizabeth Delap, and was sent in his seventh year to a village school kept by an old quätermaster on half-pay, who professed to teach nothing but reading, writing, and arithmetic, but who had an inexhaustible fund of stories about ghosts, bacteria, and fairies, about the great Krapare chiefs, Baldearn O'Donnell and gallopping Hogan, and about the exploits of Peterborough and Stanhope, the surprise of Monjuich and the glorious disaster of Bribuega. This man must have been of the Protestant religion; but he was of the aboriginal race, and not only spoke the Irish language, but could pour forth unpremeditated Irish verses.

Oliver early became, and through life continued to be, a passionate admirer of the Irish music, and especially of the compositions of Carolan, some of the last notes of whose harp he heard. It ought to be added that Oliver, though by birth one of the English, and though connected by numerous ties with the Established Church, never showed the least sign of that contemptuous antipathy with which, in his days, the ruling minority in Ireland too generally regarded the subject majority.

So far indeed was he from sharing in the opinions and feelings of the caste to which he belonged that he conceived an aversion to the Glorious and Immortal Memory, and, even when George III. was on the throne, maintained that nothing but the restoration of the banished dynasty could save the country.

From the humble academy kept by the old soldier Goldsmith was removed in his ninth year. He went to several grammar-schools, and acquired some knowledge of the ancient languages. His life at this time seems to have been far from happy. He had, as appears from the admirable portrait of him by Reynolds at Knole, features harsh even to ugliness. The small-pox had set its mark on him with more than usual severity. His stature was small, and his limbs ill put together. Among boys little tenderness is shown to personal defects; and the ridicule excited by poor Oliver's appearance was heightened by a peculiar simplicity and a disposition to blunder which he retained to the last. He became the common butt of boys and masters, was tossed about as a fright in the play-ground, and flogged as a dunce in the school-room. When he had risen to eminence, those who had once derided him ransacked their memories for the events of his early years, and recited repartees and couplets which had dropped from him, and which, though little noticed at the time, were supposed, a quarter of a century later, to indicate the powers which produced the Vice or Wakefield and the Deserted Village.

On the 11th of June 1744, being then in his sixteenth year, Oliver went up to Trinity College, Dublin, as a sizar. The sizar paid nothing for food and tuition, and very little for lodging; but they had to perform some menial services from which they have long since disappeared. Goldsmith was quartered, not alone, in a garret of what was then No. 35 in a range of buildings which has long since disappeared. His name, scrawled by himself on one of its window-panes is still preserved in the college library. From such garrets many men of less parts than his have made their way to the woolpack or to the episcopal bench. But Goldsmith, while he suffered all the humiliations, threw away all the advantages of his matriculation. He neglected the studies of the place, stood low at the examinations, was turned down at the bottom of his class for playing the buffoon in the lecture-room, was severely reprimanded for pumping on a constable, and was caned by a brutal tutor for giving a ball in the attic storey of the college to some gay youths and demimuses from the city.

While Oliver was leading at Dublin a life divided between squallid distress and squallid dissipation, his father died, leaving a mere peculie. In February 1749 the youth obtained his bachelor's degree, and left the university. During some time the humble dwelling to which his widowed mother had retired was his home. He was now in his twenty-first year; it was necessary that he should do something; and his education seemed to have fitted him to do nothing but to dress himself in gaudy colours, of which he was as fond as a magpie, to take a hand at cards, to sing Irish airs, to play the flute, to angle in summer and to tell ghost stories by the fire in winter. He tried five or six professions in turn without success. He applied for ordination; but, as he applied in scarlet clothes, he was speedily turned out of the episcopal palace. He then became tutor in an opulent family, but soon quitted his situation in consequence of a dispute about pay. Then he determined to emigrate to America. His relations, with much satisfaction, saw him set out for Cork on a good horse, with £50 in his pocket. But in six weeks he came back on a miserable hack, without a penny, and informed his mother that the ship in which he had taken his passage, having got a fair wind while he was at a party of pleasure, had sailed without him. Then he resolved to study the law. A generous uncle, Mr Contarine, advanced £50. With this sum Goldsmith went to Dublin, was enticed into a gaming-house and lost every shilling. He then thought of medicine. A small purge was made up; and in his twenty-fourth year he was sent to Edinburgh. At Edinburgh he passed eighteen months in the hospital, and though he never procured for himself a supper and a bed he contrived to make as far as he could with his £50, which he did not owe to the taste of the Italians; but he contrived to live on the alms which he obtained at the gates of convenits. It should, however, be observed that the stories which he told about this part of his life ought to be received with great caution; for strict veracity was never one of his virtues; and a man who is ordinarily inaccurate in narration is likely to be more than ordinarily inaccurate when he talks about his own travels. Goldsmith, indeed, was so regardless of truth as to assert in print that he was present at a most interesting conversation between Voltaire and Fontenelle, and that this conversation was published in Paris. Now it is certain that Voltaire never was within a hundred leagues of Paris during the whole time which Goldsmith passed on the continent.

In February 1756 the wanderer landed at Dover, without a shilling, without a friend and without a calling. He had indeed, if his own unsupported evidence may be trusted, obtained a doctor's degree on the continent; but this dignity proved utterly useless to him. In England his flute was not in request; there were no convenits; and he was forced to have recourse to a series of desperate expedients. There is a tradition that he turned strolling player. He pounded drugs and ran about London with phials for charitable chemists. He asserted, upon one occasion, that he had lived “among the beggars in Axe Lane.” He was for a time usher of a school, and felt the miseries and humiliations of this situation so keenly that he thought it a promotion to be permitted to earn his bread as a bookseller's hack; but he soon found the new yoke more galling than the old one, and was glad to become an usher again. He obtained a medical appointment in the service of the East India Company; but the appointment was speedily revoked. Why it was revoked we are not told. The subject was one on which he never liked to talk. It is probable that he was incompetent to perform the duties of the place. Then he presented himself at Surgeons' Hall for examination, as “mate to an hospital.” Even to so humble a post he was found unequal. Nothing remained but to return to the lowest drudgery of literature. Goldsmith took a room in a tiny square off Ludgate Hill, to which he had to climb
GOLDSMITH, OLIVER

from Sea-coal Lane by a dizzy ladder of flagstones called Breakneck Steps. Green Arbour Court and the ascent have long disappeared. Here, at thirty, the unlucky adventurer sat down to toil like a galley slave. Already, in 1758, during his first bondage to letters, he had translated Martelib’s remarkable *Memoirs of a Protestant, Condemned to the Galleys of France for his Religion*. In the years that now succeeded he sent to the press some things which have survived, and many which have perished. He produced articles for reviews, magazines and newspapers; children’s books, which, bound in gilt paper and adorned with handsome woodcuts, appeared in the window of Newbery’s once far-famed shop at the corner of Saint Paul’s churchyard; *An Improved Estimate of the Late London Fire*, a work in which he noticed his first literary appearance; a volume of essays entitled *The Beg; a Life of Beaus Nash*; a superficial and incorrect, but very readable, *History of England*, in a series of letters purporting to be addressed by a nobleman to his son; and some very lively and amusing sketches of London Society in another series of letters purporting to be addressed by a Chinese traveller to his friends. All these works were anonymous; but some of them were well known to Goldsmith’s; and he gradually rose in the estimation of the booksellers for whom he did the work, and, employed for more exact research or grave disquisition he was not well qualified by nature or by education. He knew nothing accurately; his reading had been desultory; nor had he meditated deeply on what he had read. He had seen much of the world; but he had noticed and retained little more of what he had seen than some grotesque incidents and characters which had happened to strike his fancy. But, though his mind was very scantily stored with materials, he used what materials he had in such a way as to produce a wonderful effect. There have been many greater writers; but perhaps no writer was ever more uniformly agreeable. His style was always pure and easy, and, on proper occasions, pointed and energetic. His narratives were always amusing, his descriptions always picturesque, his humour rich and joyous, yet not without an occasional tinge of amiable sadness. About everything that he wrote, serious or sportive, there was a certain natural grace and decorum, hardly to be expected from a man a great part of whose life had been passed among thieves and beggars, street-walkers and merrydreadns, in those squalid dens which are the reproach of great capitals. As his name gradually became known, the circle of his acquaintance widened. He was introduced to Johnson, who was then considered as the first of living English writers; to Reynolds, the first of English painters; and to Burke, who had not yet entered parliament, but had distinguished himself greatly by his writings and by the eloquence of his conversation. With these eminent men Goldsmith became intimate. In 1763 he was one of the nine original members of that celebrated fraternity which has sometimes been called the Literary Club, but which has always disclaimed that epithet, and still gloryes in the simple name of the Club.

By this date Goldsmith had quitted his miserable dwelling at the top of Breakneck Steps, and, after living for some time at No. 6 Wine Office Court, Fleet Street, had moved into the Temple. But he was still often reduced to pitiable shifts, the most popular of which is connected with the sale of his solitary novel, *the Vicar of Wakefield*. Towards the close of 1764(7) his rent is alleged to have been so long in arrear that his landlord one morning called in the help of a sheriff’s officer. The debtor, in great perplexity, despatched a messenger to Johnson; and Johnson, always friendly, though often surly, sent back the messenger with a guinea, and promised to follow speedily. He came, and found that Goldsmith had changed the guinea, and was railing at the landlord over a bottle of Madeira. Johnson put the cork into the bottle, and entreated his friend to consider calmly how money was to be procured. Goldsmith said that he had a novel ready for the press. Johnson glanced at the manuscript, saw that there were good things in it, took it to a bookseller, sold it for £60 and soon returned with the money. The rent was paid; and the sheriff’s officer withdrew. (Unfortunately, however, for this time-honoured version of the circumstances, it has of late years been discovered that as early as October 1762 Goldsmith had already sold a third of the *Vicar* to the Benjamin Collins of Salisbury, a printer, by whom it was eventually printed for F. Newbery, and it is difficult to reconcile this fact with Johnson’s narrative.)

But before the Vicar of Wakefield appeared in 1766, came the great crisis of Goldsmith’s literary life. In Christmas week 1764 he published a poem, entitled the *Traveller*. It was the first work to which he had put his name, and it at once raised him to the rank of a legitimate English classic. The opinion of the most skilful critics was that nothing finer had appeared in verse since the fourth book of the *Dunciad*. In one respect the *Traveller* differs from all Goldsmith’s other writings. In general his designs were bad, and his execution good. In the *Traveller* the execution, though deserving of much praise, is far inferior to the design. No philosophical poem, ancient or modern, has a plan so noble, and at the same time so simple. An English wanderer, seated on a crag among the Alps, near the point where three great countries meet, looks down on the boundless prospect, reviews his long pilgrimage, recalls the varieties of scenery, of climate, of government, of religion, of national character; and at last, and perhaps with some sense of pride or shame, he composition of the poem, no one can tell how just or unjust, that our happiness depends little on political institutions, and much on the temper and regulation of our own minds.

While the fourth edition of the *Traveller* was on the counters of the booksellers, the *Vicar of Wakefield* appeared, and rapidly obtained a popularity which has lasted down to our own time, and which is likely to last as long as our language. It is indeed one of the worst that ever was constructed. It wants, not merely that probability which ought to be found in a tale of common English life, but that consistency which ought to be found even in the wildest fiction about witches, giants and fairies. But the earlier chapters have all the sweetness of pastoral poetry, together with all the vivacity of comedy. Moses and his spectacles, the vicar and his monogamy, the sharper and his cosmogony, the squire proving from Aristotle that relatives are related, Olivia preparing herself for the arduous task of converting a rakish lover by studying the controversy between Robinson Crusoe and Friday, the great ladies with their scandal about Sir Tomlyn’s amours and Dr Burdock’s verses, and Mr Burchell with his “Fudge,” have caused as much harmless mirth as had ever been caused by matter packed into so small a number of pages. The latter part of the tale is unworthy of the beginning. As we approach the catastrophe, the absurdities lie thicker and thicker, and the gleams of pleasure become rarer and rarer.

The success which had attended Goldsmith as a novelist emboldened him to try his fortune as a dramatist. He wrote the *Good Natur’d Man*, a piece which had a worse fate than it deserved. Garrick refused to produce it at Drury Lane. It was acted at Covent Garden in January 1768, but was coldly received. The author, however, cleared by his benefit nights, and by the sale of the copyright, no less than £500, five times as much as he had made by the *Traveller* and the *Vicar of Wakefield* together. The plot of the *Good Natur’d Man* is, like almost all Goldsmith’s plots, very ill constructed. But some passages are exquisitely ludicrous,—much more ludicrous indeed than suited the taste of the town at that time. A canting, mawkish play, entitled *False Delicacy*, had just been produced, and sentimentality was all the mode. During some years more tears were shed at comedies than at tragedies; and a pleasantry which moved the audience to anything more than a grave smile was reprobated as low. It is not strange, therefore, that the very best scene in the *Good Natur’d Man*, that in which Miss Richland finds her lover attended by the bailiff and the bailiff’s follower in full court dresses, should have been mercilessly hissed, and should have been omitted after the first night, not to be restored for several years.

In May 1770 appeared the *Deserted Village*. In mere diction and versification this celebrated poem is fully equal, perhaps superior, to the *Traveller*; and it is generally preferred to the
Traveller by that large class of readers who think, with Bayes in the Rehearsal, that the only use of a plot is to bring in fine things. More discerning judges, however, while they admire the beauty of the details, are shocked by one unpardonable fault which pervades the whole. The fault which we mean is not that theory about wealth and luxury which has so often been censured by political economists. The theory is indeed false; but the poem, considered merely as a poem, is not necessarily the worse on that account. The finest poem in the Latin language—indeed, the finest didactic poem in any language—was written in the Very English prose and meanest of all systems of natural and moral philosophy. A poet may easily be pardoned for reasoning ill; but he cannot be pardoned for describing ill, for observing the world in which he lives so carelessly that his portraits bear no resemblance to the originals, for exhibiting as copies from real life monstrous combinations of things which never were and never could be found together. What would be thought of a painter who should mix August and January in one landscape, who should introduce a frozen river into a harvest scene? Would it be a sufficient defence of such a picture to say that every part was exquisitely coloured, that the green hedges, the apple-trees loaded with fruit, the waggons reeling under the yellow sheaves, and the sun-burned reapers wiping their foreheads were very fine, and that the ice and the boys sliding were also very fine? To such a picture the Deserted Village bears a great resemblance. It is made up of incongruous parts. The village in its happy days is a true English village. The village in its decay is an Irish village. The felicity and the misery which Goldsmith has brought close together belong to two different countries and to two different stages in the progress of society. He had assuredly never seen in his native island such a rural paradise, such a seat of plenty, content and tranquillity, as his Auburn. He had assuredly never seen in England all the inhabitants of such a paradise turned out of their homes in one day and forced to emigrate in a body to America. The hamlet he had probably seen in Kent; the ejectment he had probably seen in Munster; but by joining the two, he has produced something which never was and never will be seen in any part of the world.

In 1773 Goldsmith tried his chance at Covent Garden with a second play, She Stoops to Conquer. The manager was, not without great difficulty, induced to bring this piece out. The sentimental comedy still reigned, and Goldsmith's comedies were not sentimental. The Good Natur'd Man had been too funny to succeed; yet the mirth of the Good Natur'd Man was sober when compared with the rich drollery of She Stoops to Conquer, which is, in truth, an incomparable farce in five acts. On this occasion, however, genius triumphed. Pit, boxes and galleries were in a constant roar of laughter. If any bigoted admirer of Kelly and Cumberland ventured to his or groan, all the most silenced by a general cry of "turn him out," or "throw him over." Later generations have confirmed the verdict which was pronounced on that night.

While Goldsmith was writing the Deserted Village and She Stoops to Conquer, he was employed on works of a very different kind—works from which he derived little reputation but much profit. He compiled for the use of schools a History of Rome, by which he made £250; a History of England, by which he made £500; a History of Greece, for which he received £250; a Natural History, for which the booksellers covenanted to pay him 800 guineas. These works he produced without any elaborate research, by merely selecting, abridging and translating into his own clear, pure and flowing language, what he found in books well known to the world, but too bulky or too dry for boys and girls. He committed some strange blunders, for he knew nothing with accuracy. Thus, in his History of England, he tells us that Naseby is in Yorkshire; nor did he correct this mistake when the book was reprinted. He was very nearly hoaxed into putting into the History of Greece an account of a battle between Alexander and Mountfield. In his Animated Nature he relates, with faith and with perfect gravity, all the most absurd lies which he could find in books of travels about gigantic Patagonians, monkeys that preach sermons, nightingales that repeat long conversations. "If he can tell a horse from a cow," said Johnson, "that is the extent of his knowledge of zoology." How little Goldsmith was qualified to write about the physical sciences is sufficiently proved by two anecdotes. He on one occasion denied that the sun is longer in the northern than in the southern signs. It was vain to cite the authority of Maupertuis. "Maupertuis!" he cried, "I understand those matters better than Maupertuis." On another occasion he, in defiance of the evidence of his own senses, maintained obstinately, and ever angrily, that he chewed his dinner by moving his upper jaw.

Yet, ignorant as Goldsmith was, few writers have done more to make the first steps in the laborious road to knowledge easy and pleasant. His compilations are widely distinguished from the compilations of ordinary bookmakers. He was a great, perhaps an unequalled, master of the arts of selection and condensation. In these respects his histories of Rome and of England, and still more his own abridgments of these histories, well deserved to be studied. In general nothing is less attractive than an epilogue; but the exordiums of Goldsmith, even when most concise, are always amusing; and to read them is considered intelligent children not as a task but as a pleasure.

Goldsmith might now be considered as a prosperous man. He had the means of living in comfort, and even in what to one who had so often slept in barns and on bulks must have been luxury. His fame was great and was constantly rising. He lived in what was intellectually far the best society of the kingdom. Not only a select society in which no talent or access to punishment was wanted, and in which the art of conversation was cultivated with splendid success. There probably were never four talkers more admirable in four different ways than Johnson, Burke, Beaufort, and Garrick; and Goldsmith was on terms of intimacy with all the four. He aspired to share in their colloquial renown, but never was ambition more unfortunate. It may seem strange that a man who wrote with so much perspicuity, vivacity and grace should have been, whenever he took a part in conversation, an empty, noisy, blundering rattle. But on this point the evidence is overwhelming. So extraordinary was the contrast between Goldsmith's published works and the silly things which he said, that Horace Walpole described him as an inspired idiot. "Noll," said Garrick, "wrote like an angel, and talked like poor Poll." Chamier declared that it was a hard exercise of faith to believe that so foolish a chatterer could have really written the Traveller. Even Boswell could say, with contemptuous compassion, that he liked very well to hear honest Goldsmith run on. "Yes, sir," said Johnson, "but he should not like to hear himself." Minds differ as rivers differ. There are transparent and sparkling rivers from which it is delightful to drink as they flow; to such rivers the minds of such men as Burke and Johnson may be compared. But there are rivers of which the water when first drawn is turbid and noisome, but becomes pellicid as crystal and delicious to the taste, if it be suffered to stand till it has deposited a sediment; and such a river is a type of the mind of Goldsmith. His first thoughts on every subject were confused even to absurdity, but they required only a little time to work themselves clear. When he wrote they had that time, and therefore his readers pronounced him a man of genius; but when he talked he talked nonsense and made himself the laughing-stock of all his hearers. He was painfully sensible of his inferiority in conversation; he felt every failure keenly; yet he had not sufficient judgment and self-command to hold his tongue. His animal spirits and vanity were always impelling him to try to do the one thing which he could not do. After every attempt he felt that he had exposed himself, and writhe with shame and vexation; yet the next moment he began again.

His associates seem to have regarded him with kindness, which, in spite of their admiration of his writings, was not unmixed with contempt. In truth, there was in his character much to love, but very little to respect. His heart was soft even to weakness;
he was so generous that he quite forgot to be just; he forgave injuries so readily that he might be said to invite them, and was so liberal to beggars that he had nothing left for his tailor and his butcher. He was vain, sensual, frivolous, profuse, improvident. One vice of a darker shade was imputed to him, envy. But there is not the least reason to believe that this bad passion, though it sometimes made him wince and utter fretful exclamations, ever impelled him to injure by wicked arts the reputation of any of his rivals. The truth probably is that he was not more envious, but merely less prudent, than his neighbours. His heart was on his lips. All those small jealousies, which are but too common among men of letters, but which a man of letters who is also a man of the world does his best to conceal, Goldsmith avowed with the simplicity of a child. When he was envious, instead of affecting indifference, instead of damning with faint praise, instead of doing injuries slyly and in the dark, he told everybody that he was envious. "Do not, pray, do not, talk of Johnson in such terms," he said to Boswell; "you harrow up my very soul." George Steevens and Cumberland were men far too cunning the least such a thing. They would have echoed the praises of a man whom they envied, and then have sent to the newspapers anonymous libels upon him. Both what was good and what was bad in Goldsmith’s character was to his associates a perfect security that he would never commit such villainy. He was neither ill-natured enough, nor long-headed enough, to be guilty of any malicious act which required contrivance and disguise.

Goldsmith has sometimes been represented as a man of genius, cruelly treated by the world, and doomed to struggle with disease and poverty. But it is evident that Johnson’s praise of his great powers can be more remote from the truth. He did, indeed, go through much sharp misery before he had done anything considerable in literature. But after his name had appeared on the title-page of the Traveller, he had none but himself to blame for his distresses. His average income, during the last seven years of his life, certainly exceeded £200 a year, and £400 a year ranked, among the incomes of that day, at least as high as £600 a year would rank at present. A single man living in the Temple, with £400 a year, might then be called opulent. Not one in ten of the young gentlemen of good families who were studying the law they lived so much. But all the wealth which Lord Loughborough brought from Bengal and Sir Lawrence Dundas from Germany, joined together, would not have sufficed for Goldsmith. He spent twice as much as he had. He wore fine clothes, gave dinners of several courses, paid court to venal beauties. He had also, it should be remembered, to the honour of his heart, though not of his head, a guinea, or five, or ten, according to the state of his purse, ready for any tale of distress, true or false. But it was not in dress or feasting, in promiscuous amours or promiscuous charities, that his chief expense lay. He had been from boyhood a gambler, and at once the most sanguine and the most skilful of gamblers. For a time he put off the day of inevitable ruin by temporary expedients. He obtained advances from booksellers by promising to execute works which he never began. But at length this source of supply failed. He owed more than £2000; and he saw no hope of extrication from his embarrassments. His spirits and health gave way. He was attacked by a nervous fever, which he thought himself competent to treat. It would have been happy for him if his medical skill had been appreciated as justly by himself as by others. Notwithstanding the degree which he pretended to have received on the continent, he could procure no patients. "I do not practise," he once said; "I make it a rule to prescribe only for my friends." "Pray, dear Doctor," said Beaufort, "alter your rule; and prescribe only for your enemies." Goldsmith, now, in spite of this excellent advice, prescribed for himself. The remedy aggravated the malady. The sick man was induced to call in real physicians; and they at one time imagined that they had cured the disease. Still his weakness and restlessness continued. He could get no sleep. He could take no food. "You are worse," said one of his medical attendants, "than you should be from the degree of fever which you have. Is your mind at ease?" "No; it is not," were the last recorded words of Oliver Goldsmith. He died on the 4th of April 1774, in his forty-sixth year. He was laid in the churchyard of the Temple; but the spot was not marked by any inscription and is now forgotten. The coffin was followed by Burke and Reynolds. Both these great men were sincere mourners. Burke, when he heard of Goldsmith’s death, had burst into a flood of tears. Reynolds had been so much moved by the news that he had flung aside his brush and palette for the day. A short time after Goldsmith’s death, a little poem appeared, which will, as long as our language lasts, associate the names of his two illustrious friends with his own. It has already been mentioned that he sometimes felt keenly the sarcasm which his wild blundering talk brought upon him. He was, not long before his last illness, provoked into retaliating. He wisely bestowed himself to his pen; and at that weapon he proved himself a match for all his assailants together. Within a small compass he drew with a singularly easy and vigorous pencil the characters of nine or ten of his intimate associates. Though his little work did not receive his last touches, it must always be regarded as a masterpiece. It is impossible, however, not to wish that four or five likenesses which have no interest for posterity were wanting to that noble gallery, and that their places were supplied by sketches of Johnson and Gibbon, as happy and vivid as the sketches of Burke and Garrick.

Some of Goldsmith’s friends and admirers honoured him with a cenotaph in Westminster Abbey. Nollekens was the sculptor, and Johnson wrote the inscription. It is much to be lamented that Johnson did not leave to posterity a more durable and a more valuable memorial of his friend. A life of Goldsmith would have been an inestimable addition to the Lives of the Poets. No man appreciated Goldsmith’s writings more justly than Johnson; no man was better acquainted with Goldsmith’s character and habits; and no man was more competent to delineate with truth and spirit the peculiarities of a mind in which great powers were found in company with great weaknesses. But the list of poets to whose works Johnson was requested by the booksellers to furnish prefaces ends with Lyttelton, who died in 1773. The line seems to have been drawn expressly for the purpose of excluding the person whose portrait would have most fitly closed the series. Goldsmith, however, has been fortunate in his biographers.

Goldsmith’s life has been written by Prior (1837), by Washington Irving (1846–1849), and by John Forster (1848, 2nd ed. 1854). The diligence of Prior deserves great praise; the style of Washington Irving is always pleasing; but the highest place must, in justice, be assigned to the eminently interesting work of Forster. Subsequent biographies are by William Black (1789), and Austin Dobson (1888, American ed. 1890). The above article by Lord Macaulay has been slightly revised for this edition by Mr Austin Dobson, as regards questions of fact for which there has been new evidence.

GOLDSTÜCKER, THEODOR (1821–1872), German Sanskrit scholar, was born of Jewish parents at Königsberg on the 18th of January 1821, and, after attending the gymnasium of that town, entered the university in 1836 as a student of Sanskrit. In 1856 he removed to Bonn, and, after graduating at Königsberg, he proceeded to Paris; in 1842 he edited a German translation of the Prabodha Chhandas. From 1847 to 1850 he resided at Berlin, where his talents and scholarship were recognized by Alexander von Humboldt, but where his advanced political views caused the authorities to regard him with suspicion. In the latter year he removed to London, where in 1852 he was appointed professor of Sanskrit in University College. He now worked on a new Sanskrit dictionary, of which the first installment appeared in 1856. In 1861 he published his chief work: Pāṇini: his place in Sanskrit literature; and he was one of the founders and chief promoters of the Sanskrit Text Society; he was also an active member of the Philological Society, and of other learned bodies. He died in London on the 6th of March 1872.

As Literary Remains some of his writings were published in two volumes (London, 1879), but his papers were left to the India Office with the request that they were not to be published until 1920.
GOLDWELL, THOMAS (d. 1585), English ecclesiastical, began his career as vicar of Cheriton in 1531, after graduating M.A. at All Souls College, Oxford. He became chaplain to Cardinal Pole and lived with him at Rome, was attainted in 1539, but returned to England on Mary's accession, and in 1555 became bishop of St Asaph, a diocese which he did much to win back to the old faith. On the death of Mary, Goldwell escaped from England and in 1562 became superior of the Theatines at Naples. He was the only English bishop at the council of Trent, and in 1562 was again attainted. In the following year he was appointed vicar-general to Carlo Borromeo, archbishop of Milan. He died in Rome in 1585, the last of the English bishops who had refused to accept the Reformation.

GOLDZIEHER, IGNAZ (1829-1907), Jewish Hungarian orientalist, was born in Stuhlweissenburg on the 22nd of June 1829. He was educated at the universities of Budapest, Berlin, Leipzig and Leiden, and became privat docent at Budapest in 1872. In the next year, under the auspices of the Hungarian government, he began a journey through Syria, Palestine and Egypt, and took the opportunity of attending lectures of Mahomedan sheiks in the mosque of el-Azhar in Cairo. He was the first Jewish scholar to become professor in the Budapest University (1894), and represented the Hungarian government and the Academy of Sciences at numerous international congresses. He received the large gold medal at the Stockholm Oriental Congress in 1889. He became a member of several Hungarian and other learned societies, was appointed secretary of the Jewish community in Budapest. He was made Litt. D. of Cambridge (1904) and LL.D. of Aberdeen (1906). His eminence in the sphere of scholarship is due to his many original investigations on Mahomedan and Mahomedan law, tradition, religion and poetry, in connexion with which he published a large number of treatises, review articles and essays contributed to the collections of the Hungarian Academy.

Among his chief works are: Beiträge zur Literaturgeschichte der Schrifta (1874); Beiträge zur Geschichte der Sprachgelehrsamkeit bei den Mahomedanern (1873); Der Kopfshah der Hermetik und seine geschichtliche Entwickelung (Leipzig, 1876); Eng. trans., M. Martineau, London, 1877; Muhomedanische Studien (Halle, 1889-1890, 2 vols.); Abhandlungen zur arabischen Philologie (Leiden, 1896-1899, 2 vols.); Buch v. Wesen d. Steile (cd. 1907).

GOLETTA [LA GOUFFET], a town on the Gulf of Tunis in 36° 53' N. 10° 19' E., a little south of the ruins of Carthage, and on the north side of the ship canal which traverses the shallow Lake of Tunis and leads to the city of that name. Built on the narrow strip of sand which separates the lake from the gulf, Goletta is defended by a fort and battery. The town contains a summer palace of the bey, the old seraglio, arsenal and custom-house, and many villas, gardens and pleasure resorts, Goletta being a favourite place for sea-bathing. A short canal, from which the name of the town is derived (Arab. Halk-el-Wad, "throat of the canal"), 40 ft. broad and 8 ft. deep, divides the town and affords communication between the ship canal and a dock or basin, 1084 ft. long and 541 ft. broad. An electric tramway which runs along the north bank of the ship canal connects Goletta with the city of Tunis (q.v.). Pop. (1907) about 5000, mostly Jews and Italian fishermen.

Beyond Cape Carthage, 5 m. N. of Goletta, is La Marsa, a summer resort overlooking the sea. The bay has a palace here, and the French resident-general, the British consul, other officials, and many Tunisians have country-houses, surrounded by groves of olive trees.

Before the opening of the ship canal in 1893 Goletta, as the port of Tunis, was a place of considerable importance. The basin at the Goletta end of the canal now serves as a subsidiary harbour to that of Tunis. The most stirring events in the history of the town are connected with the Turkish conquest of the Barbary states. Khair-ed-Din Barbarossa having made himself master of Tunis and its port, Goletta was attacked in 1555 by the emperor Charles V., who seized the pirate's fleet, which was sheltered in the small canal, his arsenal, and 300 brass cannon. The Turks regained possession in 1574. (See Tunisia: History.)

GOLF (in its older forms Goff, Gouff or Goffe, the last of which gives the genuine old pronunciation), a game which probably derives its name from the Ger. kolbe, a club—in Dutch, kolf—which last is nearly in sound identical and might suggest a Dutch origin, 1 which many pictures and other witnesses further support.

History.—One of the most ancient and most interesting of the pictures in which the game is portrayed is the tailpiece to an illuminated Book of Hours made at Bruges at the beginning of the 16th century. The original is in the British Museum. The players, three in number, have but one club apiece. The heads of the clubs are steel or steel covered. They play with a ball each. That which gives this picture a peculiar interest over the many pictures of Dutch schools that portray the game in progress is that most of them show it on the ice, the putting being at a stake. In this Book of Hours they are putting at a hole in the turf, as in our modern golf. It is scarcely to be doubted that the game is of Dutch origin, and that it has been in favour since very early days. Further than that our knowledge does not go. The early Dutch masters play the golf, they painted golf, but they did not write it. It is uncertain at what date golf was introduced into Scotland, but in 1457 the popularity of the game had already become so great as seriously to interfere with the more important pursuit of archery. In March of that year the Scottish parliament "decreted and ordained that wapinshowings be halden be the lords and baronis spirituale and temporale, four times in the zeir; and that the fute-ball and golf be utterly cryt down, and nocht usit; and that the bowe-merkis be maid at ilk paroche kirk a pair of buttis, and schutin be usit ilk Sunday." Fourteen years afterwards, on May 1475, the vigorous Lord Provost Sir William Douglas, by an act "anent wapinshowings," and in 1491 a final and evidently angry humiliation was issued on the general subject, with pains and penalties annexed. It runs thus—" Futeball and Golfe forbidden. Item, it is statute and ordainit that in na place of the realme there be usit fute-ball, golfe, or uther sik unprofitabill sportis," &c. This, be it noted, is an edict of James IV.; and it is not a little curious presently to find the monarch himself setting an ill example to his commons, by practice of this "unprofitable sport," as is shown by various entries in the accounts of the lord high treasurer of Scotland (1503-1506) about 1492. About a century later the game again appears on the surface of history, and it is quite as popular as before. In the year 1592 the town council of Edinburgh "ordains proclamation to be made throw this burgh, that na inhabitants of the samyn be seen at any pastymes within or without the town, upon the Sabbath day, sic as golfe, &c." The following year the edict was re-announced, but with the modification that the prohibition was "in tyme of sermons."

Golf has from old times been known in Scotland as "The Royal and Ancient Game of Golf." Though no doubt Scottish monarchs handled the club before him, James IV. is the first who figures formally in the golfing record. James V. was also very partial to the game distinctly known as "royal"; and there is some scrap of evidence to show that his daughter, the unhappy Mary Stuart, was a golfer. It was alleged by her enemies that, as showing her shameless indifference to the fate of her husband, a very few days after his murder, she "was seen playing golf and Pallmall in the fields beside Seton." 2 That her son, James VI. (afterwards James I. of England), was a golfer, tradition confidently asserts, though the evidence which connects him with the personal practice of the game is slight. Of the interest he took in it we have evidence in his act—already alluded to—" anent golfe ballis," prohibiting their importation, except under certain conditions. 3 From an enactment of James VI. (then James I. of England), bearing date 1618, we find that a considerable importation of golf balls at that time took place from Holland, and as thereby "na smal quantite of golde and silver is transported erty out of his Hienes' kingdom of Scotland" (see letter of His Majesty from Salisbury, the 5th of August 1618), he issues a royal prohibition, at once as a wise economy of the national moneys, and a protection to native industry in the article. From this it might almost seem that the game was at that date still known and practised in Holland.

1 Records of the City of Edinburgh.
2 Inventories of Mary Queen of Scots, preface, p. lxx. (1863).
3 From an enactment of James VI. (then James I. of England), bearing date 1618, we find that a considerable importation of golf balls at that time took place from Holland, and as thereby "na smal quantite of golde and silver is transported erty out of his Hienes' kingdom of Scotland" (see letter of His Majesty from Salisbury, the 5th of August 1618), he issues a royal prohibition, at once as a wise economy of the national moneys, and a protection to
Already there was a chain of links all round the coast, besides numerous inland courses; but since 1880 their increase has been extraordinary, and the number which has been formed in the colonies and abroad is very large also, so that in the Golfers' Year Book for 1906 a space of over 300 pages was allotted to the Club Directory alone, each page containing, on a rough average, six clubs. To compute the average membership of these clubs is very difficult. There is not a little overlapping, in the sense that a member of one club will often be a member of several others; but probably the average may be placed at something like 200 members for each club.

The immense amount of golf-playing that this denotes, the large industry in the making of clubs and balls, in the upkeep of links, in the actual work of club-carrying by the caddies, and in the instruction given by the professional class, is obvious. Golf has taken a strong hold on the affections of the people in many parts of Ireland, and the fashion for golf in England has reacted strongly on Scotland itself, the ancient home of the game, where since 1850 golfers have probably increased in the ratio of forty to one. Besides the industry that such a growth of the game denotes in the branches immediately connected with it, as mentioned above, there is to be taken into further account the visiting population that it brings to all lodging-houses and hotels within reach of a tolerable golf links, so that many a fishing village has risen into a moderate watering-place by virtue of no other attractions than those which are offered by its golf course. Therefore to the Briton, golf has developed from something of which he had a vague idea—as of "curling"—to something in the nature of an important business, a business that can make towns and has a considerable effect on the receipts of railway companies.

Moreover, ladies have learned to play golf. Although this is a crude and brief sentence, it does not state the fact too widely nor too forcibly, for though it is true that before 1885 many played on the short links of St Andrews, North Berwick, Westward Ho and elsewhere, still it was virtually unknown that they should play on the longer courses, which till then had been in the undisputed possession of the men. At many places women now have their separate links, at others they play on the same course as the men. But even where links are set apart for women, they are far different from the little courses that used to be assigned to them. They are links only a little less formidable in their bunkers, a little less varied in their features than those of men. The ladies have their annual championship, which they play on the long links of the men, sometimes on one, sometimes on another, but always on courses of the first quality, demanding the finest display of golfing skill.

The claim that England made to a golfing fellowship with Scotland was conceded very strikingly by the admission of three English greens, first those of Hoylake and of Sandwich, and in 1900 Deal, into the exclusive list of the links on which the open championship of the game is decided. Before England had so fully assimilated Scotland's game this great annual contest was waged at St Andrews, Musselburgh and Prestwick in successive years. Now the ancient green of Musselburgh, somewhat worn out with length of hard and gallant service, and moreover, as a nine-holes course inadequately accommodating the numbers who compete in the championships to-day, has been superseded by the course at Muirfield as a championship arena. While golf had been making itself a force in the southern kingdom, the professional element—men who had learned the game from childhood, had become past-masters, were capable of giving instruction, and also of making clubs and balls and looking after the greens on which golf was played—had at first been taken from the northern side of the Border. But when golf had been started long enough in England for the little boys who were at first employed as "caddies"—in carrying the players' clubs—to grow to sufficient strength to drive the ball and make their master's game better, that the Scotchman who thus began to play in their boyhood some few should develop an exceptional talent for the game. This, in fact, actually happened, and English golfers, both of the amateur

restrictions. Charles L. (as his brother Prince Henry had been!) was devotedly attached to the game. Whilst engaged in it on the links of Leith, in 1642, he made several trips of the Irish rebellion of that year. He had not the energy to finish his match, but returned precipitately and in much agitation to Holyrood. Afterwards, while prisoner to the Scots army at Newcastle, he found his favourite diversion in "the royal game." The King was nowhere treated with more honour than at Newcastle, as he himself confessed, both he and his train having liberty to go abroad and play at golf in the Shield Field, without the walls. Of his son, Charles II., as a golfer, nothing whatever was ascertained, but James II. was a known devotee. After the Restoration, James, then duke of York, was sent to Edinburgh in 1681/2 as commissioner of the king to parliament, and an historical monument of his prowess as a golfer remains there to this day in the "Golfer's Land," as it is still called, 77 Canongate. The duke having been challenged by two English noblemen of his suite, to play a match against them, for a very large stake, along with any Scotch ally he might select, chose as his partner one "Johne Paterson," a shoemaker. The duke and the said Johne won easily, and half of the large stake the duke made over to his humble companion, who therewith built himself the house mentioned above. In 1834 William IV. became patron of the St Andrews Golf Club (St Andrews being then, as now, the most famous seat of the game), and approved of its being styled "The Royal and Ancient Golf Club of St Andrews." In 1837, as further proof of royal favour, he presented to it a magnificent gold medal, which "should be challenged and played for annually"; and in 1838 the queen dowager, Duchess of St Andrews, became patroness of the club, and presented to it a handsome gold medal —"The Royal Adelaide"—with a request that it should be worn by the captain, as president, on all public occasions. In June 1863 the prince of Wales (afterwards Edward VII.) signified his desire to become patron of the club, and in the following September was elected captain by acclamation. His engagements did not admit of his coming in person to undertake the duties of the office, but his brother Prince Leopold (the duke of Albany), having in 1876 done the club the honour to become its captain, twice visited the ancient city in that capacity.

In more recent days, golf has become increasingly popular in a much wider degree. In 1880 the man who travelled about England with a set of golf clubs was an object of some astonishment, almost of alarm, to his fellow-travellers. In those days the commonest of questions in regard to the game was, "You have to be a fine rider, do you not, to play golf?" So confounded was it in the popular mind with the game of polo. At Blackheath a few Scotsmen resident in London had long played golf. In 1864 the Royal North Devon Club was formed at Westward Ho, and this was the first of the seaside links discovered and laid out for golf in England. In 1869 the Royal Liverpool Club established itself in possession of the second English course of this quality at Hoylake, in Cheshire. A golf club was formed in connexion with the London Scottish Volunteers corps, which had its house on the Putney end of Wimbledon Common on Putney Heath; and, after making so much of a start, the progress of the game was slow, though steady, for many years. A few more clubs were formed; the numbers of golfers grew; but it could not be said that the game was yet in any sense popular in England. All at once, for no very obvious reason, the qualities of the ancient Scotch game seemed to strike home, and from that moment its popularity has been wonderfully and increasingly great. The English links that rose into most immediate favour was the fine course of the St George's Golf Club, near Sandwich, on the coast of Kent. To the London golfer it was the first course of the first class that was reasonably accessible, and the fact made something like an epoch in English golf. A very considerable increase, it is true, in the number of English golfers and English golf clubs had taken place before the discovery for golfing purposes of the links at Sandwich.
and the professional classes, have proved themselves so adept at Scotland's game, that the championships in either the Open or the Amateur competitions have been won more often by English than by Scottish players of late years. Probably in the United Kingdom to-day there are as many English as Scottish professional golf players, and their relative number is increasing.

Golf also "caught on," to use the American expression, in the United States. To the American of 1850 golf was largely an unknown thing. Since then, however, golf has become perhaps a greater factor in the life of the upper and upper-middle classes in the United States than it ever has been in England or Scotland. Golf to the English and the Scots meant only one among several of the sports and pastimes that take the man and the woman of the upper and upper-middle classes into the country and the fresh air. To the American of like status golf came as the one thing to take him out of his towns and give him a reason for exercise in the country. To-day golf has become an interest all over North America, but it is in the Eastern States that it has made most difference in the life of the classes with whom it has become fashionable. Westerners and Southerners found more excuses before the coming of golf for being in the open country air. It is in the Eastern States more especially that it has had so much influence in making the people live and take exercise out of doors. In truly a competitive spirit the American woman golfer plays on a perfect equality with the American man. She does not compete in the men's championships; she has championships of her own; but she plays, without question, on the same links. There is no suggestion of relegating her, as a certain cynical writer in the Badminton volume on golf described it, to a waste corner, a kind of "Jews' Quarter," of the links. And the Americans have taken up golf in the spirit of a sumptuous and opulent people, spending money on magnificent clubhouses beyond the finest dreams of the Englishman or the Scot. The greatest success achieved by any American golfer fell to the lot of Mr Walter Travis of the Garden City club, who in 1904 won the British amateur championship.

So much enthusiasm and so much golf in America have not failed to make their influence felt in the United Kingdom. Naturally and inevitably they have created a strong demand for professional instruction, both by example and by precept, and for professional advice and assistance in the laying-out and upkeep of the many new links that have been created in all parts of the States, sometimes out of the least promising material. But, in line with the American custom for every luxury and sport, the Americans have not failed to attract the golfing party that are to the British rate on the scale of the dollar to the shilling, they have attracted many of the best Scottish and English professionals to pay them longer or shorter visits as the case may be, and thus a new opening has been created for the energies of the professional golfing class.

The Game.—The game of golf may be briefly defined as consisting in hitting the ball over a great extent of country, preferably of that sand-hill nature which is found by the sea-side, and finally hitting or "putting" it into a little hole of some 4 in. diameter cut in the turf. The place of the hole is commonly marked by a flag. Eighteen is the recognized number of these holes on a full course, and they are at varying distances apart, from 100 yds. up to anything between a ½ and ¾ m. For the various strokes required to achieve the hitting of the ball over the great hills, and finally putting it into the small hole, a number of different "clubs" has been devised to suit the different positions in which the ball may be found and the different directions in which it is wished to propel it. At the start for each hole the ball may be placed on a favourable position (e.g., "on the green") or be served on the ball (e.g., "sand-bunker") for striking it, but after that it may not be touched, except with the club with which it is hit into the next hole: A "full drive," as the farthest distance that the ball can be hit is called, is about 200 yds. in length, of which some three-fourths will be traversed in the air, and the rest by bounding or running over the ground. It is easily to be understood that when the ball is lying on the turf behind a tall sand-hill, or in a bunker, a differently-shaped club is required for raising it over such an obstacle from that which is needed when it is placed on the tee to start with; and again, that another club is needed to strike the ball out of a cup or out of heavy grass. It is this variety that gives the game its charm.

The British Amateur Championship is decided by a tournament in matches thus played, each defeated player retiring, and his opponent passing on into the next round. In the case of the Open Championship, and in most medal competitions, the scores are differently reckoned—each man's total score (irrespective of his relative merit at each hole) being reckoned at the finish against the total score of the other players in the competition. There is also a species of competition called "bogey" play, in which each man plays against a "bogey" score—a score fixed in advance according to the length of the course; and in the competition relatively to the other players the number of holes that he is to the good or to the bad of the "bogey" score at the end of the round. The player who is most holes to the good, or fewest holes to the bad, wins the competition. It may be mentioned incidentally that golf occupies the almost unique position of being the only sport in which even a single player can enjoy his game, his opponent in this event being "Colonel Bogey"—more often than not a redoubtable adversary.

The links which have been thought worthy, by reason of their geographical positions and their merits, of being the scenes on which the championships are fought out, are, as we have already said, three in Scotland—St Andrews, Prestwick and Muirfield—and three in England—Hoylake, Sandwich and Deal. This brief list is very far from being complete as regards links of first-class quality in Great Britain. Besides those named, there are in Scotland—Carnoustie, North Berwick, Cruden Bay, Nairn, Aberdeen, Dornoch, Troon, Machrihanish, South Uist, Islay, Guilan, Luffness and many more. In England there are—Westward Ho, Bembridge, Littlestone, Great Yarmouth, Brancaster, Seaton Carew, Formby, Lytham, Harlech, Burnham, among the seaside ones; while of the inland, some of them of very fine quality, we cannot even attempt a selection, so large is the list. Of links that have been quite prominent in recent years, Ireland has Portrush, Newcastle, Portsalon, Dollymount and many more of the first class; and there are excellent courses in the Isle of Man, and in the United States many fine courses have been constructed. There is not a British colony or province that does not have its golf course—Australia, India, South Africa, all have their golf championships, which are keenly contested. Canada has had courses at Quebec and Montreal, and many in the United States. Up to 1891, at least, is the oldest established (next to the Blackheath Club), the next oldest being the club at Pau in the Basses-Pyrénées.

The Open Championship of golf was started in 1860 by the Prestwick Club giving a belt to be played for annually under the condition that it should become the property of any who could win it thrice in succession. The following is the list of the champions:

1860. W. Park, Musselburgh 174—at Prestwick.
1861. Tom Morris, sen., Prestwick 163—at Prestwick.
1862. Tom Morris, jun., Musselburgh 166—at Prestwick.
1863. W. Park, Musselburgh 168—at Prestwick.
1865. Tom Morris, jun., Prestwick 164—at Prestwick.
1866. W. Park, Musselburgh 169—at Prestwick.
1867. Tom Morris, sen., St Andrews 170—at Prestwick.
1870. Tom Morris, jun., St Andrews 149—at Prestwick.
1871. Tom Morris, junior, won the belt finally, according to the conditions. In 1871 there was no competition; but by 1872 the three clubs of St Andrews, Prestwick and Musselburgh had subscribed £100 which was to be played for over the course of each subscribing club successively, but should not have been awarded to the champion of the winner. In later years the course at Muirfield was substituted for that at Musselburgh, and Hoylake and Sandwich were admitted to the list of championships. It was decided to put up two rounds, or thirty-six holes, determined the championship, but from 1892 the result has been determined by the play of 72 holes.
After the interregnum of 1871, the following were the champions:—

1872. Tom Morris, jun., St Andrews
1873. Mr. John Ball, St Andrews
1874. Mungo Park, Musselburgh
1875. Willie Park, Musselburgh
1876. Bob Martin, St Andrews
1877. Jamie Anderson, St Andrews
1878. Willie Grant, Musselburgh
1878. Bob Ferguson, Musselburgh
1879. Bob Ferguson, Musselburgh
1880. W. Ferme, Dumfries
1881. Jack Soutoune, Musselburgh
1882. Bob Martin, St Andrews
1883. D. Brown, Musselburgh
1884. Willie Has Grant, Musselburgh
1885. Jack Burns, Warwick
1886. Willie Park, jun., Musselburgh
1887. Mr John Ball, jun., Hoylake
1888. Hugh Kirkaldy, St Andrews
1889. Mr. H. H. Hilton, Hoylake
1890. W. Auchterlonie, St Andrews
1891. J. Taylor, Winchester
1892. H. Taylor, Winchester
1893. H. Vardon, Scarborough
1894. Mr. H. H. Hilton, Hoylake
1895. H. Vardon, Yorkshire
1896. H. Vardon, Scarborough
1897. H. Taylor, Richmond
1898. J. Braid, Romford
1899. H. Vardon, Hoylake
1900. H. Vardon, Canton
1901. J. White, Sunningdale
1902. B. Heath, St Andrews
1903. J. Braid, Walton Heath
1904. Arnaud Massey, La Boulie
1905. B. Braid, Walton Heath
1906. H. Taylor, Richmond
1907. J. Braid, Walton Heath
1908. B. Braid, Walton Heath
1909. J. Braid, Walton Heath
1910. J. Braid, Walton Heath
1911. Mr. John Ball, St Andrews
1912. Mr. John Ball, St Andrews
1913. Mr. John Ball, St Andrews
1914. Mr. John Ball, St Andrews
1915. Mr. John Ball, St Andrews

The Amateur Championship is of far more recent institution.

1886. Mr Horace Hutchinson at St Andrews
1887. Mr Horace Hutchinson at Hoylake
1888. Mr. John Ball at Prestwick
1889. Mr. J. E. Lidzay at St Andrews
1890. Mr. John Ball at Hoylake
1891. Mr. J. E. Lidzay at St Andrews
1892. Mr. John Ball at Sandbach
1893. Mr. P. Anderson at Prestwick
1894. Mr. John Ball at Hoylake
1895. Mr. L. Balfour-Melville at St Andrews
1896. Mr. F. G. Tait at Sandbach
1897. Mr. J. T. Allan at Muirfield
1898. Mr. John Ball at Hoylake
1899. Mr. John Ball at Prestwick
1900. Mr. H. H. Hilton at Sandbach
1901. Mr. H. H. Hilton at St Andrews
1902. Mr. F. Hutchings at Hoylake
1903. Mr. R. M. Bell at Muirfield
1904. Mr. W. J. Travis at St Andrews
1905. Mr. A. G. Barry at St Andrews
1906. Mr. J. Robb at Hoylake
1907. Mr. John Ball at St Andrews
1908. Mr. E. A. Lassen at Sandbach
1909. Mr. Robert Maxwell at Muirfield
1910. Mr. John Ball at Hoylake

The Ladies' Championship was started in 1893.

1893. Lady M. Scott at St Andrews
1894. Lady M. Scott at Littlestone
1895. Lady M. Scott at Portrush
1896. Miss E. C. Orr at Hoylake
1897. Miss E. C. Orr at Gullane
1898. Miss L. Thompson at Yarmouth
1899. Miss L. Thompson at Newcastle
1900. Miss R. K. Adair at Westward Ho
1901. Miss M. A. Graham at Aberdovv
1902. Miss M. Hezlet at Deal
1903. Miss M. Hezlet at Portrush
1904. Miss L. Dod at Troon
1905. Miss B. Thompson at Cromer
1906. Miss B. Thompson at Burnham
1907. Miss M. Titterton at Newcastle(Co. Down)
1908. Miss M. Titterton at St Andrews
1909. Miss D. Campbell at Birkdale
1910. Miss D. Campbell at Westward Ho

There have been some slight changes of detail and arrangement as time has gone on, in the rules of the game (the latest edition of the Rules should be consulted). A new class of golfer has arisen, requiring a code of rules framed rather more exactly than the older code. The Scottish golfer, who was "teethed" on a golf club, as Mr. Andrew Lang has described it, imbued all the traditions of the game with his natural sustenance. Very few rules sufficed for him. But when the Englishman, and still more the American (less in touch with the traditions), began to play golf as a new game, then they began to ask for a code of rules that should be lucid and illuminating on every point—an ideal perhaps impossible to realize. It was found, at least, that the code put forward by the Royal and Ancient Club of St Andrews did not realize it adequately. Nevertheless the new golfers were very loyal indeed to the club that had ever of old held this position of authority. The Royal and Ancient Club was appealed to by English golfers to step into the place, analogous to that of the Marylebone Cricket Club in cricket, that they were both willing and anxious to give it. It was a place that the Club at St Andrews did not in the least wish to occupy, but the honour was thrust so insistently upon it, that there was no declining. The latest effort to meet the demands for some more satisfactory legislation on the thousand and one points that continually must arise for decision in course of playing a game of such variety as golf, consists of the amendment of the statement of the rules, called "Rules of Golf Committee." Its members all belong to the Royal and Ancient Club; but since this club draws its membership from all parts of the United Kingdom, this restriction is quite consistent with a very general representation of the views of north, south, east and west—from Westward Ho and Sandwich to Dornoch, and all the many first-rate links of Ireland—on the committee. Ireland has, indeed, some of the best links in the kingdom, and yields to neither Scotland nor England in enthusiasm for the game. This committee, after a general revision of the rules into the form in which they now stand, consider every month, either by meeting or by correspondence, the questions that are sent up to it by clubs or by individuals; and the committee's answers to these questions have the force of law until they have come before the next general meeting of the Royal and Ancient Club at St Andrews, which may confirm or may reject them at will. The ladies of Great Britain manage otherwise. They have a Golfing Union which settles questions for them; but since this union itself accepts as binding the answers given by the Rules of Golf Committee, they really arrive at the same conclusions. It is not possible, in the view of the American Union, governing the play of men and women alike in the States, really act differently. The Americans naturally reserve to themselves freedom to make their own rules, but in practice they conform to the legislation of Scotland, with the exception of a more drastic definition of the status of the amateur player, and certain differences as to the clubs used.

A considerable modification has been effected in the implements of the game. The tendency of the modern wooden clubs is to be short in the head as compared with the clubs of, say, 1880 or 1885. The advantage claimed (probably with justice) for this shape is that it masses the weight behind the point on which the ball is struck. Better material in the wood of the club is a consequence of the increased demand for these articles and the increased competition among their makers. Whereas under the old conditions a few workers at the few greens then in existence were enough to supply the golfing wants, now there is a very large industry in golf club and ball making, which not only employs workers in the local club-makers' shops all the kingdom over, but is an important branch of the commerce of the stores and of the big patent leather-covering firms, both in Great Britain and in the United States. By far the largest modification in the game since the change to gutta-percha balls from balls of leather-covering stuffed with feathers, is due to the American invention of the india-rubber cased balls. Practically it is an American invention that it is still regarded, although the British law courts decided, after a lengthy trial (1905), that there had been "prior users" of the principle of the balls' manufacture, and therefore that the patent of Mr Haskell, by whose name the
first balls of the kind were called, was not good. It is singular to remark that in the first introduction of the gutta-percha balls, superseding the leather and feather compositions, they also were called by the name of their first maker, "Gourlay." The general mode of manufacture of the rubber-cored ball, which is now everywhere in use, is, interiorly, a hard core of gutta-percha or some other such substance; round this is wound, by machinery, India-rubber thread or strips at a high tension, and over all is an outer coat of gutta-percha. Some makers have tried to dispense with the kernel of hard substance, or to substitute for it kernels of some fluid or gelatinous substance, but in general the above is a sufficient, though rough, description of the mode of making all these balls. Their superiority over the solid gutta-percha lies in their superior resiliency. The effect is that they go much more lightly off the club. It is not so much in the tee-shots that this superiority is observed, as in the second shots, when the ball is lying badly; balls of the rubber-cored kind, with their greater liveliness, are more easy to raise in the air from a lie of this kind. They also go remarkably off the iron clubs, and thus make the game easier by placing the player within an iron shot of the hole at a distance where he would have to use a wooden club if he were playing with a solid gutta-percha ball. They also tend to make the game more easy by the fact that if they are at all mis-hit they go much better than a gutta-percha ball similarly inaccurately struck. As a slight set-off against these qualities, the ball, because of the greater liveliness, is not quite so good for the short game as the solid ball; but on the whole its advantages distinctly overbalance its disadvantages. When these balls were first put on the market they were sold at two shillings each and even, when the supply was quite unequal to the demand, at a greater deal higher price, rising to as much as a guinea a ball. But the normal price, until about a year after the decision in the British courts of law affirming that there was no patent in the balls, was always two shillings for the best quality of ball. Subsequently there was a reduction down to one shilling for the balls made by many of the manufacturing companies, though in 1910 the rise in the price of rubber sent up the cost. The rubber-cored ball does not go out of shape so quickly as the gutta-percha solid ball and does not show other marks of ill-usage with the club so obviously. It has had the effect of making the game a good deal easier for the second- and third-class players, favouring especially those who were short drivers with the old gutta-percha ball. To the best players it has made the least difference, nevertheless those who were best with the old ball are also best with the new; its effect has merely been to bring the second, third and fourth best closer to each other and to the best.

Incidentally, the question of the expenses of the game has been touched on in this notice of the new balls. There is no doubt that the balls themselves tend to a greater economy, not only because of their own superior durability but also because, as a consequence of their greater resiliency, they are not nearly so hard on the clubs, and the clubs themselves being perhaps made of better material than used to be given to their manufacture, the total effect is that a man's necessary annual expenditure on them is very small indeed even though he plays pretty constantly. Four or five rounds are not more than the average of golfers will make an India-rubber cored ball last them, so that the outlay on the weapons is very moderate. On the other hand the expenditure of the clubs on their courses has increased and tends to increase. Demands are more insistent than they used to be for a well kept course, for perfectly mown greens, renewed teeing grounds and so on, and probably the modern golfer is a good deal more luxurious in his clubhouse wants than his father used to be. This means a big staff of servants and workers on the green, and to meet this a rather heavy subscription is required. Such a subscription as five guineas added to a ten or fifteen guineas,entrance fee is not uncommon, and even this is very heavy compared with the subscriptions of some of the clubs in the United States, where twenty dollars a year, or twenty pounds of our money, is not unusual. But on the whole golf is a very economical pastime, as compared with almost any other sport or pastime which engages the attention of Britons, and it is a pastime for all the year round, and for all the life of a man or woman.

Glossary of Technical Terms used in the Game.

Addressing the Ball.—Putting oneself in position to strike the ball.
All Square.—Term used to express that the score stands level, neither to being a hole up.
Baff.—To strike the ground with the club when playing, and so lose the ball unduly.
Baffy.—A short wooden club, with laid-back face, for lofting shots.
Bake.—The number of times which a good average player should take to each hole. This imaginary player is usually known as "Colonel Bogey," and plays a fine game.
Brassy.—A wooden club with a brass sole.
Bulge.—A driver in which the face bulges into a convex shape. The head is shorter than in the older-fashioned driver.
Bunker.—A sand-pit.

The holes remaining after one side has become more holes up than remain for play.

Caddie.—The person who carries the clubs. Diminutive of "cad" ; cf. haddie (from Fr. caddet).
Club.—The iron-headed club that is capable of the farthest drive of any of the clubs with iron heads.

Cup.—A depression in the ground causing the ball to lie badly.
Dead.—A ball is said to be "dead" when so near the hole that the caddie can hit it in and out of the hole in one stroke. A ball is said to "fall dead" when it pitches with hardly any run.
Dip.—A piece of turf cut out in the act of playing, which, be it noted, should always be replaced before the play moves on.
Dormy.—One side is said to be "dormy" when it is as many holes to the good as remain to be played—so that it cannot be beaten.
Driver.—The longest driving club, used when the ball lies very well and a long shot is needed.

Foolish.—Any very badly missed or bungled stroke.
Fore.—A cry of the front. It is a short drive.
Foursome.—A match in which four persons engage, two on each side playing alternately with the same ball.

Green.—(a) The links as a whole; (b) the "putting-greens" around the holes.
Grip.—(a) The part of the club-shaft which is held in the hands while playing; (b) the grasp itself—e. g., "a firm grip," "a loose grip," are common expressions.

Half-Sport.—A shot played with something less than a full swing.
Halved.—A hole is "halved" when both sides have played it in the same number of strokes. A round is "halved" when each side has won and lost the same number of holes.
Handicap.—The strokes which a player receives either in match play or competition.

Hanging.—Said of a ball that lies on a slope inclining downwards in regard to the direction in which it is wished to drive.

Hazard.—A general term for bunker, whin, long grass, roads and all kinds of bad ground.

Heel.—To hit the ball on the "heel" of the club, i.e. the part of the club which faces the left, and so send the ball to the right, with the same result as from a slice.

Honour.—The privilege (which its holder is not at liberty to decline) of striking off first from the tee to the green.
Iron.—An iron-headed club intermediate between the cleek and lofting mashie. There are driving irons and lofting irons according to the purposes for which they are intended.

Loft.—(a) The angle of the club-head with the shaft (e. g., a "flat lie," "an upright lie"); (b) the position of the ball on the ground (e. g., "a good lie," "a bad lie").

Like, The.—The stroke which makes the player's score equal to his opponent's in course of playing a hole.

Like-as-we-Lie.—Said when both sides have played the same number of strokes.

Line.—The direction in which the hole towards which the player is progressing lies with reference to the present position of his ball.

Mashie.—An iron club with a short head. The lofting mashie has the blade much laid back, for playing a short lofting shot. The driving mashie has the blade less laid back, and is used for longer, less lofted shots.

Match-Play.—Play in which the score is reckoned by holes won and lost.

Medal-Play.—Play in which the score is reckoned by the total of strokes taken on the round.

Niblick.—A short stiff club with a short, laid back, iron head, used for putting the ball out of a very bad lie.
Odd, The.—A stroke more than the opponent has played.
Press.—To strive to hit harder than you can hit with accuracy.
Put.—To hit the ball with a pulling movement of the club, so as to make it curve to the right.
Putt.—To play the short strokes near the hole (pronounced as in "put").

Putter.—The club used for playing the short strokes near the hole. Some have a wooden head, some an iron head.
GOLIAD—GOLIARD

Rub-of-the-Green.—Any chance deflection that the ball receives as it goes along.
Run Up.—To send the ball low and close to the ground in approaching the hole—opposite to lofting it up.
Scratch Player.—Player who receives no odds in handicap competitions.
Slice.—To hit the ball with a cut across it, so that it flies curved to the right.
Slence.—(a) The place on which the player has to stand when putting a ball, "a good stance," is a common expression; (b) the position relative to each other of the player's feet.
Stymie.—When one ball lies in a straight line between another and the hole the ball is said to "be a stymie to" the other, from an old Scottish word given by Jamieson to mean "the faintest form of anything." The idea probably was, the "stymie" only left you the "faintest form" of the hole to aim at.
Teec.—The part of sand upon which the ball is generally placed for the first drive to each hole.
Teesing-Ground.—The place marked as the limit, outside of which it is not permitted to drive the ball off. This marked-out ground is also sometimes called "the tee." Top.—To hit the ball above the centre, so that it does not rise much from the ground.
Up.—A player is said to be "one up," "two up," &c., when he is so many holes to the good of his opponent.
Wrist-Shot.—A shot less in length than a half-shot, but longer than a putt.

BIBLIOGRAPHY.—The literature of the game has grown to some considerable bulk. For many years it was practically comprised in the fine work by Mr Robert Clark, Golf: A Royal and Ancient Game, together with a series of books on the game by Mr C. B. Forbes and Mr Forgan respectively, and the Golfsana Miscellanea of Mr Stewart. A small book by Mr Horace Hutchinson, named Hints on Golf, was very shortly followed by a much more important work by Sir Walter Simpson, The Modern Amateur Golfer, which still stands, with few exceptions, the Russia. The Badminton Library book on Golf attempted to collect into one volume the most interesting historical facts known about the game, with the help of a dozen or advice to learners, and, on similar didactic lines, books have been written by Mr H. C. S. Everard, Mr Garden Smith and W. Park, the professional player. Mr H. J. Whigham, sometime amateur champion golfer of the United States, has given us a book about the game in that country, The Book of Golf and Golfers, compiled, with assistance, by Mr Horace Hutchinson, is in the first place a picture-gallery of famous golfers in their respective attitudes of play. Taylor, Vardon and Braid have each contributed a volume of instruction, and Mr G. W. Bland has published a book with admirable photographs of players in action, called Great Golfers: their Methods at a Glance. A work intended for the use of green committees is among the volumes of the Country Library of Sport. Much interesting lore is contained in the Golfing Annual, in the Golfer's Year Book and in the pages of Golf, which has now become Golf Illustrated, a weekly paper devoted to the game. Among works that have primarily a local interest, but that contain much of historical value about the game, may be cited the Golf Book of East Lothian, by the Rev. John Kerr, and the Chronicle of Blackheath Golfers, by Mr W. E. Hughes. (H. G. H.)

GOLIAD, an unincorporated village and the county-seat of Goliad county, S.A., on the N. bank of the San Antonio river, 85 m. S.E. of San Antonio. Pop. (1900) about 1700. It is served by the Galveston, Harrisburg & San Antonio railway (Southern Pacific System). Situated in the midst of a rich farming and stock-raising country, Goliad has flour mills, cotton gins and cotton-seed oil mills. Here are the interesting ruins of the old Spanish mission of La Bahia, which was removed to this point from the Guadalupe river in 1747. During the struggle between Mexico and Spain the Mexican leader Bernardo Gutiérrez (1778–1814) was besieged here. The name Goliad, probably an abbreviation of Goliad, the Biblical name, was first used about 1829. On the outbreak of the Texas War of Liberation Goliad was garrisoned by a small force of Mexicans, who surrendered to the Texans in October 1835, and on the 20th of December a preliminary "declaration of independence" was published here, antedating by several months the official Declaration issued at Old Washington, Texas, on the 2nd of March 1836. In 1836, when Santa Anna began his advance against the Texan posts, Goliad was occupied by a force of about 350 Americans under Colonel James W. Fannin (c. 1800–1836), who was driven off the Coletto Creek while attempting to carry out orders to withdraw from Goliad and to unite with General Houston; he surrendered after a sharp fight (March 19–20) in which he inflicted a heavy loss on the Mexicans, and was marched back with his force to Goliad, where on the morning of the 27th of March they were shot down by Santa Anna's orders. Goliad was nearly destroyed by a tornado on the 19th of May 1863.

GOLIARD, a name applied to those wandering students (vagantes) and clerks in England, France and Germany, during the 12th and 13th centuries, who were better known for their rioting, gambling and intemperance than for their scholarship. The derivation of the word is uncertain. It may come from the Lat. gula, gluttony (Wright), but was connected by them with a mythical "Bishop Goliad," also called "archipèlo" and "primas"—especially in Germany—in whose name their satirical poems were mostly written. Many scholars have accepted Büdinger's suggestion (Über einige Reste der Vagantentposie in Österreich, Vienna, 1834) that the title of Golias goes back to the letter of St Bernard to Innocent II., in which he referred to Abelard as Goliath, thus connecting the goliards with the keen-witted student adherents of that great medieval critic. Giesebrecht and others, however, support the derivation of goliard from goliard, a gay fellow, leaving "Golias" as the imaginary "patron" of their fraternity.

Spiegel has ingeniously disentangled something of a biography of an archipèlo who flourished mainly in Burgundy and at Salzburg from 1160 to beyond the middle of the 13th century; but the proof of the reality of this individual is not convincing. It is doubtful, too, if the jocular references to the rules of the "gild" of goliards should be taken too seriously, though their apting of the "orders" of the church, especially their contrasting them with the methods of church synods. Their satires were almost uniformly directed against the church, attacking even the pope. In 1227 the council of Trèves forbade priests to permit the goliards to take part in chanting the service. In 1229 they played a conspicuous part in the disturbances at the university of Paris, in connexion with the intrigues of the papal legate. During the century which followed they formed a subject for the deliberations of several church councils, notably in 1228 when it was ordered that "no clerks shall be jongleurs, goliards or buffoons," and in 1300 (at Cologne) when they were forbidden to play cards or engage in the indulgence traffic. This legislation was only effective when the "privileges of clergy" were withdrawn from the goliards. Those historians who regard the middle ages as completely dominated by ascetic ideals, regard the goliard movement as a protest against the spirit of the time. But it is rather indicative of the wide diversity in temperament among those who crowded to the universities in the 13th century, and who found in the privileges of the cleric some advantage and attraction in the student life. The goliard poems are as truly "medieval" as the monastic life which they despised; they are the truly overtone of the section of humanity. Yet their criticism was most keenly pointed, and marks a distinct step in the criticism of abuses in the church.

Along with these satires went many poems in praise of wine and riotous living. A remarkable collection of them, now at Munich, from the monastery at Benedictbeuren in Bavaria, was published by Schmeller (3rd ed., 1853) under the title Carmina Burana. Many of these, which form the main part of song-books of German students to-day, have been delicately translated by John Addington Symonds in a small volume, Wine, Women and Song (Leipzig, 1872). As Symonds has said, they form a prelude to the Renaissance. The poems of "Bishop Golias" were later attributed to Walter Mapes, and have been published by Thomas Wright in The Latin Poems commonly attributed to Walter Mapes (London, 1841).

The word "goliard" itself outlived these turbulent bands which had given it birth, and passed over into French and English literature of the 14th century in the general meaning of jongleur or minstrel, quite apart from any clerical association. It is thus used in Piers Plowman, where, however, the goliard still rhymes in Latin, and in Chaucer.

See, besides the works quoted above, M. Haenzer, Goliatricichung und die Satire im 13ten Jahrhundert in England (Leipzig, 1905); Spiegel, Die Vaganten und ihr "Orden" (Spies, 1892); Hubatsch, Die lateinischen Vagantenlieder des Mittelalters (Götzic, 1870), and the article in La grande Encyclopédie. All of these have bibliographical apparatus.
GOLIATH—GOLITSIUN, V. V.

GOLIATH, the name of the giant by slaying whom David achieved renown (1 Sam. xvii.). The Philistines had come up to make war against Saul and, as the rival camps lay opposite each other, this warrior came forth day by day to challenge to single combat. Only David ventured to respond, and armed with a sling and pebbles he overcame Goliath. The Philistines, seeing their champion killed, lost heart and were easily put to flight. The giant's arms were placed in the sanctuary, and it was his father Elhanan who took them. Thus the shaft of his spear (1 Sam. xxi. 1-9). From another passage we learn that Goliath, of Gath, "the shaft of whose spear was like a weaver's beam," was slain by a certain Elhanan of Bethlehem in one of David's conflicts with the Philistines (2 Sam. xxi. 18-22)—the parallel to 1 Chron. xx. 5, avoids the contradiction by reading the "brother of Goliath." But this old popular story has probably preserved the more original tradition, and if Elhanan is the son of Dodo in the list of David's mighty men (2 Sam. xlii. 9, 24), the resemblance between the two names may have led to the transference. The narratives of David and Goliath are apt to be exploited by means of which he gained the favour of Saul, Jonathan and Israel, but the absence of all reference to his achievement in the subsequent chapters (1 Sam. xxi. 11, xxix. 3) is evidence of the relatively late origin of a tradition which in course of time became one of the best-known incidents in David's life (Ps. cxvii., LXX. title, the apocryphal Ps. cli., Eccles. xivii. 4).

See DAVID; SAMUEL (BOOKS) and especially Cheyne, Aids and Devout Study of Criticism, pp. 80 sqq., 125 sqq. In the old Egyptian romance of Sinuhet (ascribed to about 2000 B.C.), the story of the slaying of the Bedouin hero has several points of resemblance with that of David and Goliath. See L. R. Paton, Hist. of Syr, and Pal. p. 661; A. Jeremiás, Das A.T. im Lichte d. alien Orientis, 2 ed. pp. 299, 491; A. R. S. Kennedy, Century Bible; Samuel, p. 122, argues that David's Philistine adversary, Baalzebub, was originally nameless, in 1 Sam. xvii. he is named only in v. 4.

GOLITSIUN, BORIS ALEKSYEViCH (1654–1714), Russian statesman, came of a princely family, claiming descent from Prince Gedimiu of Lithuania. Earlier members of the family were Mikhail (d. c. 1552), a famous soldier, and his great-grandson Vasily Vasilevich (d. 1619), who was sent as ambassador to Poland to offer the Russian crown to Prince Ladislaus. Boris became court chamberlain in 1676. He was one of Tsar Peter's chief supporters when, in 1689, Peter resisted the usurpations of his elder sister Sophia, and the head of the loyal council which assembled at the Truitsa monastery during the crisis of the struggle. Golitsuin was the prince who suggested taking refuge in that strong fortress and won over the boyars of the opposite party. In 1690 he was created a boyar and shared with Lev Narushin, Peter's uncle, the conduct of home affairs. After the death of the tsaritsa Natalia, Peter's mother, in 1694, his influence increased still further. He accompanied Peter to the White Sea (1694–1695); took part in the Azov campaign (1695); and was one of the triumvirates who ruled Russia during Peter's first foreign tour (1697–1698). The Astrakhan rebellion (1706), which affected all the districts under his government, shook Peter's confidence in him, and seriously impaired his position. In 1707 he was superseded in the Volga provinces by Andrei Matveyev. A year before his death he entered a monastery. Golitsuin was a typical representative of Russian society of the end of the 17th century in its transition from barbarism to civilization. In many respects he was far in advance of his age. He was highly educated, spoke Latin with graceful fluency, frequented the society of scholars and had his children carefully educated according to the best European models. Yet this eminent, this superior personage was an habitual drunkard, an uncouth savage who intruded upon the hospitality of wealthy foreigners, and was not ashamed to seize upon any dish he took a fancy to, and send it home to his wife. It was his reckless drunkenness which ultimately ruined him in the estimation of Peter the Great, despite his previous inestimable services.

See S. Solovev, History of Russia (Russ.), vol. xiv. (Moscow, 1885); R. N. Bain, The First Romanovs (London, 1905). (R. N. B.)

GOLITSIUN, DMITRY MIKHAILOVICH (1665–1737), Russian statesman, was sent in 1697 to Italy to learn "military affairs"; in 1704 he was appointed to the command of an auxiliary corps. In Poland against Charles XII.; from 1711 to 1718 he was governor of Byelogorod. In 1718 he was appointed president of the newly erected Kammer Kollegium and a senator. In May 1723 he was implicated in the disgrace of the vice-chancellor Shafirov and was deprived of all his offices and dignities, which he only recovered through the mediation of the empress Catherine I. After the death of Peter the Great, Golitsuin became the recognized head of the Conservative party which had never forgiven Peter for putting away Eudoxia and marrying the plebeian Martha Skavronskaya. But the reformers, as represented by Alexander Menshikov and Peter Tolstoi, prevailed; and Golitsuin remained in the background till the fall of Menshikov, 1727. During the last years of Peter II. (1728–1730), Golitsuin was the most prominent statesman in Russia and his high aristocratic theories had full play. On the death of Peter II. he conceived the idea of limiting the autocracy by subordinating it to the authority of the supreme privy council, of which he was president. He drew up a form of constitution which Anne of Courland, the newly elected Russian empress, was forced to sign at Mittau before being permitted to proceed to St Petersburg. Anne lost no time in repudiating this constitution, and never forgave its authors. Golitsuin was left in peace, however, and lived for the most part in retirement, till 1736, when he was arrested on suspicion of being concerned in the conspiracy of his son-in-law Prince Constantine Cantimir. This, however, was mere pretext, it was for his anti-monarchical sentiments that he was really prosecuted. A court, largely composed of his antagonists, condemned him to death, but the empress reduced the sentence to lifelong imprisonment in the Great Mosque of Alexander and confiscation of all his estates. He died in his prison on the 14th of April 1737, after three months of confinement.

See R. N. Bain, The Pupils of Peter the Great (London, 1897). (R. N. B.)

GOLITSIUN, VASILIY VASILEVICH (1643–1714), Russian statesman, spent his early days at the court of Tsar Alexius where he gradually rose to the rank of boyar. In 1676 he was sent to the Ukraine to keep in order the Crimean Tatars and took part in the Chigirin campaign. Personal experience of the inconveniences and dangers of the prevailing system of prelacy, the so-called myestichesivo, or rank priority, which had paralysed the Russian armies for centuries, induced him to propose its abolition, which was accomplished by Tsar Theodore III. (1678). The May revolution of 1682 placed Golitsuin at the head of the Posolsky Prikaz, or ministry of foreign affairs, and during the regency of Sophia, sister of Peter the Great, whose lover he became, he was the principal minister of state (1682–1690) and "keeper of the great seal," a title bestowed upon him by the tsars to distinguish him from Athonas Ordovin-Nashchokin and Artamon Matveyev. In home affairs his influence was insignificant, but his foreign policy was distinguished by the peace with Poland in 1683, whereby Russia at last recovered Kiev. By the terms of the same treaty, he acceded to the grand league against the Porte, but his two expeditions against the Crimean (1689 and 1689), "the First Crimean War," were unsuccessful and made him extremely unpopular. Only with the utmost difficulty could Sophia get the young tsar Peter to decorate the defeated commander-in-chief as if he had returned a victor. In the civil war between Sophia and Peter (August–September 1689), Golitsuin half-heartedly supported his mistress and shared her ruin. His life was spared owing to the intercession of his cousin Boris, but he was deprived of his boyardom, his estates were confiscated and he was banished successively to Kargopol, Mezen and Kologora, where he died on the 21st of April 1714. Golitsuin was unusually well educated. He understood German and Greek as well as his mother-tongue, and could express himself fluently in Latin. He was a great friend of foreigners, who generally alluded to him as "the great Golitsuin." His brother Mikhail (1674–1730) was a celebrated soldier, who is best known for his campaign of Finland (1714–1721), where his admirable qualities earned the remembrance of the people whom he had conquered. And Mikhail's son Alexander (1718–
GOLIUS—GOLTZ, B.

226

GOLIUS (1572-1653) was a diplomat and soldier, who rose to be field-marshal and governor of St. Petersburg. See R. N. Bain, The First Romanovs (London, 1905); A. Brückner, Furst Goltz (Leipzig, 1887); S. Solovev, History of Russia (Moscow, 1858 &c.). (R. N. B.)

GOLIUS or (Gom.), JACOBUS (1596-1667), Dutch Orientalist, was born at the Hague in 1596, and studied at the university of Leiden, where in Arabic and other Eastern languages he was the most distinguished pupil of Erpenius. In 1622 he went out with the Dutch embassy to Morocco, and on his return he was chosen to succeed Erpenius (1624). In the following year he set out on a Syrian and Arabian tour from which he did not return until 1629. The remainder of his life was spent at Leiden where he held the chair of mathematics as well as that of Arabic. He died on the 28th of September 1667.

His most important work is the Lexicon Arabico-Latinum, fol., Leiden, 1653, which, based on the Silah of Al-Jahrawi, was superseded by the corresponding work of Freytag. Among his earlier publications may be mentioned editions of various Arabic texts (Oeconomia quadrat Alis, imperatoris Musulmin), et Carmen Togriopolitae doxicissimae, nec non dissertatio quaedam Aben Symae, 1629; and Ahmediis Arabisidas vitae et rerum gestarum Timuri, qui vulgo Tamer, lanes dicitur, historia, 1636). In 1656 he published a new edition, with additions, of the Rhetorica Arabica of Erpenius. After his death, there was found among his papers a Dictionarium Persico-Latinum which was published, with additions, by Edmund Cuspinianus in 1671. Golius also edited and annotated the astronomical treatise of Alfragan (Muhammadis, filii Keirii Ferganensis, qui vulgo Alfraganus dicitur, elementa astronomiae Arabice et Latine, 1669).

GOLNOW, a town of Germany, in the Prussian province of Pomerania, on the right bank of the Ihna, 14 m. N.E. of Stettin, with which it has communication by rail and steamers. Pop. (1895) 8539. It possesses two Evangelical churches, a synagogue and some small manufactures. Golnow was founded in 1190, and was raised to the rank of a town in 1268. It was for a time a Hanse town, and came into the possession of Prussia in 1720, having belonged to Sweden since 1648.

GOLOSH, or GALOSH (from the Fr. galoche, Low Lat. galopedia, a wooden shoe or clog; an adaptation of the Gr. kalapódhos, a diminutive formed of kála, wood, and ποδ, foot), originally a wooden shoe or patten, or merely a wooden sole fastened to the foot by a strap or cord. In the middle ages "golosh" was a general term for a boot or shoe, particularly one with a wooden sole. In modern usage, it is an outer shoe worn in bad weather to protect the inner one, and keep the feet dry. Goloshes are now almost universally made of rubber, and in the United States they are known as "rubbers" simply, the word golosh being rarely if ever used. In the bootmakers' trade, a "golosh" is the piece of leather, of a make stronger than, or different from that of the "uppers," which runs around the bottom part of a boot or shoe, just above the sole.

GOLOVIN, FEDOR ALEKSIEVICH, Count (d. 1726), Russian statesman, born, like so many of his countrymen in later times, the business of a ruler in the Far East. During the regency of Sophia, sister of Peter the Great, he was sent to the Amur to defend the new Muscovite fortress of Albasin against the Chinese. In 1689 he concluded with the Celestial empire the treaty of Nerchinsk, by which the line of the Amur, as far as its tributary the Gorbitas, was retroceded to China because of the impossibility of seriously defending it: in Peter's grand embassy to the West in 1697 Golovin occupied the second place immediately after Lefort. It was his chief duty to hire foreign sailors, and provide the Cape of Good Hope necessary for the construction and complete equipment of a fleet. On Lefort's death, in March 1699, he succeeded him as admiral-general. The same year he was created the first Russian count, and was also the first to be decorated with the newly-instituted Russian order of St Andrew. The conduct of foreign affairs was at the same time entrusted to him, and from 1699 to his death he was "the premier minister of the tsar." Golovin's first achievement as foreign minister was to supplement the treaty of Carlowitz, by which peace with Turkey had only been secured for three years, by concluding with the Porte a new treaty at Constantiople (June 13, 1700), by which the term of the peace was extended to thirty years and, besides other concessions, the Azov district and a strip of territory extending thence to Kuban were ceded to Russia. He also controlled, with consummate ability, the operations of the brand-new Russian diplomaticists at the various foreign courts. His superiority over all his Muscovite contemporaries was due to the fact that he was already a statesman, in the modern sense, while they were still learning the elements of statesmanship. His death was an irreparable loss to the tsar, who wrote upon the despatch announcing it, the words "Peter filled with grief." See R. N. Bain, The First Romanovs (London, 1905). (R. N. B.)

GOLOVVIN, GAVRIIL IVANOVICH (1660-1734), Russian statesman, was attached (1677), while still a lad, to the court of the tsarevitch Peter, afterwards Peter the Great, with whose mother Natalia he was connected, and vigilantly guarded him during the disquieting period of the regency of Sophia, sister of Peter the Great (1682-1689). He accompanied the young tsar abroad on his first foreign tour, and worked by his side in the dockyards of Saardam. In 1706 he succeeded Golovin in the direction of foreign affairs, and was created the first Russian grand-chancellor on the field of Poltava (1709). Golovkin held the office for twenty-five years. In the reign of Catherine I. he became vizir of the Grand Duchy of Finland, and was the chief conduct of affairs during this and the succeeding reigns. The empress also entrusted him with her last will whereby she appointed the young Peter II. her successor and Golovkin one of his guardians. On the death of Peter II. in 1730 he declared openly in favour of Anne, duchess of Courland, in opposition to the aristocratic Dolgorukis and Golitsins, and his determined attitude on behalf of autocracy was the chief cause of the failure of the proposed constitution, which would have converted Russia into a limited monarchy. Under Anne he was a member of the first cabinet formed in Russia, but had less influence in affairs than the Ostermann and Münnich. In 1709 he was created a count of the Holy Roman empire, and in 1710 a count of the Russian empire. He was one of the wealthiest, and at the same time one of the stingiest, magnates of his day. His ignorance of any language but his own made his intercourse with foreign ministers very inconvenient.

See R. N. Bain, The Pupils of Peter the Great (London, 1897). (R. N. B.)

GOLOVIN, VASILY MIKHAILOVICH (1726-1831), Russian vice-admiral, was born on the 20th of April 1776 in the village of Gulyanskiy in the province of Ryazan, and received his education at the Cronstadt naval school. From 1801 to 1806 he served as a volunteer in the English navy. In 1807 he was commissioned by the Russian government to survey the coasts of Kamchatka and of Russian America, including also the Kurile Islands. In 1810 he was made commodore and took part in the Holland mission to the Cape of Good Hope, and was appointed the 19th of October 1809, arrived in Kamchatka. In 1810, whilst attempting to survey the coast of the island of Kunashiri, he was seized by the Japanese, and was retained by them as a prisoner, until the 13th of October 1813, when he was liberated, and in the following year he returned to St Petersburg. Soon after this the government planned another expedition, which had for its object the circumnavigating of the globe by a Russian ship, and Golovnin was appointed to the command. He started from St Petersburg on the 7th of September 1817, sailed round Cape Horn, and landed in Jamaica. His voyage round the world, published at St Petersburg in five volumes in 1843, with maps and charts, and a biography of the author by N. Grech.

GOLTZ, BOGUMIL (1801-1870), German humorist and satirist, was born at Warsaw on the 20th of March 1801. After attending the classical schools of Marienwerder and Königsberg, he learnt farming on an estate near Thorn, and in 1821 entered the university of Breslau as a student of philosophy. But he
soon abandoned an academic career, and, after returning for a while to country life, retired to the small town of Golub, where he devoted himself to literary studies. In 1845 he settled at Thorn, "the home of Copernicus," where he died on the 12th of November 1870. Golitz is best known to literary fame by his Buch der Dichter und Denker (4th ed. Berlin, 1875), in which, after the style of Jean Paul, and Adalbert Stifter, but with a more modern realism, he gives a charming and idyllic description of the impressions of his own childhood. Among his other works must be noted Ein Jugendleben (1852); Der Mensch und die Leute (1853); Zur Charakteristik und Naturgeschichte der Frauen (1859); Zur Geschichte und Charakteristik des deutschen Genius (1864), and Die Weltkugel und die Lebensweise (1866).

Goltz's works have not been collected, but a selection will be found in Reclain's Universalbibliothek (ed. by P. Stein, 1901 and 1906). See O. Roquette, Zur Genesung, 1894.

GOLTZ, COLMAR, FREIHERR VON DER (1843— ), Prussian soldier and military writer, was born at Biekenfeld, East Prussia, on the 12th of August 1843, and entered the Prussian infantry in 1861. In 1864 he entered the Berlin Military Academy, but was temporarily withdrawn in 1866 to serve in the Austrian war, in which he was wounded at Trautenau. In 1867 he joined the topographical section of the general staff, and at the beginning of the Franco-German War of 1870-71 was attached to the staff of Prince Frederick Charles. He took part in the battles of Vionville and Gravelotte, and in the siege of Metz. After its fall he served under the Red Prince in the campaign of the Loire, including the battles of Orleans and Le Mans. He was appointed in 1873 professor at the military school at Potsdam, and the same year was promoted captain and placed in the historical section of the general staff. It was then he wrote Die Operationen der II. Armee bis zur Kapitulation von Metz und Die Sieben Tage von Le Mans, both published in 1873. In 1874 he was appointed to the staff of the 6th division, and while so employed wrote Die Operationen der II. Armee an der Loire und Lion Gambetta and seine Armeen, published in 1875 and 1876 respectively. The latter was translated into French the same year, and both are impartially written. The views expressed in the latter work led to his being sent back to regimental duty for a time, but it was not long before he returned to the military history section. In 1878 von der Goltz was appointed lecturer in military history at the military academy at Berlin, where he remained for five years and attained the rank of major. He published, in 1883, Rosbach und Jena (new and revised edition, Von Rosbach bis Jena und Arnsberge, 1906), Das Volk in Waffen (English translation The Nation in Arms), both of which quickly became military classics, and during his military career contributed many articles to the military journals. In June 1883 his services were lent to Turkey to reorganize the military establishments of the country. He spent twelve years in this work, the result of which appeared in the Greco-Turkish War of 1897, and he was made a pasha and in 1895 a muskir or field-marshall. On his return to Germany in 1896 he became a lieutenant-general and commander of the 5th division, and in 1898, head of the Engineer and Pioneer Corps and Inspector-general of fortifications. In 1900 he was made general of infantry and in 1902 commander of the I. army corps. In 1907 he was appointed inspector-general of the newly created sixth army inspection established at Berlin, and in 1908 was given the rank of colonel-general (Generaldirector).

In addition to the works already named and frequent contributions to military periodical literature, he wrote Kriegsführung (1895, later edition Krieg und Heerführung, 1895) and Krieg und Heerführung (1894); Ein Aufenthalt in Macedonien (1894); Anatolische Ausflüge (1896); a map and description of the environs of Constantinople; Von Jena bis Pr. Eylau (1897), a more important historical work, carrying on the story of Rosbach and Jena to the peace of Tilsit, &c.

GOLTZIUS, HENDRIK (1528-1617), Dutch painter and engraver, was born in 1528 at Münichreuth, in the duchy of Jülich. After studying painting on glass for some years under his father, he was taught the use of the burin by Dirk Volkertsz Coornhert, a Dutch engraver of mediocre attainment, whom he soon surpassed, but who retained his services for his own advantage. He was also employed by Philip Galle to engrave a set of prints of the history of Lucretia. At the age of twenty-one he married a widow somewhat advanced in years, whose money enabled him to establish at Haarlem an independent business; but his unpleasant relations with her affected his health that he found it advisable in 1590 to make a tour through Germany to Italy, where he acquired an intense admiration for the works of Michelangelo, which led him to surpass that master in the grotesqueness and extravagance of his designs. He returned to Haarlem considerably improved in health, and laboured there at his art till his death, on the 1st of January 1617. Goltzius ought not to be judged chiefly by the works he valued most, his eccentric imitations of Michelangelo. His portraits, though mostly miniatures, are master-pieces of their kind, both on account of their exquisite finish, and as fine studies of individual character. Of his larger heads, the life-size portrait of himself is probably the most striking example. His "master-pieces," so called from their being attempts to imitate the style of the old masters, have perhaps been overpraised. In his command of the burin Goltzius is not surpassed even by Dürer; but his technical skill is often unequally aided by higher artistic qualities. Even, however, his eccentricities and extravagances are greatly counterbalanced by the beauty and freedom of his execution. He began painting at the age of forty-two, but none of his early pieces of that branch of his art which are in the imperial collection at Vienna—display any special excellences. He also executed a few pieces in chiaroscuro.

His prints amount to more than 300 plates, and are fully described in Bartsch's Peintre-graveur, and Weigel's supplement to the same work.

GOLUCHOWSKI, AGENOR, COUNT (1840— ), Austrian statesman, was born on the 25th of March 1849. His father, descended from an old and noble Polish family, was governor of Galicia. Entering the diplomatic service, the son was in 1878 appointed attached to the Austrian embassy at Berlin, where he became secretary of legation, and hence he was transferred to Paris. After rising to the rank of counsellor of legation, he was in 1887 made minister at Bucharest, where he remained till 1893. In these positions he acquired a great reputation as a firm and skilful diplomatist, and on the retirement of Count Kalnoky in May 1893 was chosen to succeed him as Austro-Hungarian minister for foreign affairs. The appointment of a Pole caused some surprise in view of the importance of Austrian relations with Russia (then rather strained) and Germany, but the choice was justified by events. In his speech of that year to the delegations he declared the moral espousal of the Triple Alliance, and in particular the closest intimacy with Germany, to be the keystone of Austrian policy; at the same time he dwelt on the traditional friendship between Austria and Great Britain, and expressed his desire for a good understanding with all the powers. In pursuance of this policy he effected an understanding with Russia, by which neither power was to exert any separate influence in the Balkan peninsula, and thus removed a long-standing cause of friction. This understanding was formally ratified during a visit to St. Petersburg on which he accompanied the emperor in April 1897, during which visit he was establishing the European concert during the Armenian troubles of 1896, and again resisted isolated action on the part of any of the great powers during the Cretan troubles and the Greco-Turkish War. In November 1897, when the Austro-Hungarian flag was insulted at Mersina, he threatened to bombard the town if instant repairation were not made, and by his firm attitude greatly enhanced Austrian prestige in the East. In his speech to the delegations in 1898 he dwelt on the necessity of expanding Austria's mercantile commerce, and of raising the fleet to a strength which, while not vying with the fleets of the great naval powers, would ensure respect for the Austrian flag wherever his interests needed protection. He also hinted at the necessity for European combination to resist American competition. The understanding with Russia in the matter of the Balkan States temporarily endangered friendly relations with Italy,
who thought her interests threatened, until Goluchowski guaranteed in 1586 the existing order. He further encouraged a good understanding with Italy by personal conferences with the Italian foreign minister, Tittoni, in 1904 and 1905. Count Lamsdorff visited Vienna in December 1902, when arrangements were made for concerted action in imposing on the sultan reforms in the government of Macedonia. Further steps were taken after Goluchowski’s interview with the tsar at Mürzsteg in 1903, and two civil agents representing the countries were appointed for two years to ensure the execution of the promised reforms. This period was extended in 1905, when Goluchowski was the chief mover in forcing the Porte, by an international naval demonstration in the Bosporus, to promise the final emancipation of the Palatinate and connect the forms of government in Constantinople, the Balkans, and the Adriatic with those in the Danube, the Po, and the Rhine. At the conference assembled at Algeciras to settle the Morocco Question, Austria supported the German position, and after the close of the conferences the emperor William II. telegraphed to Goluchowski: “You have proved yourself a brilliant second on the dwelling ground and you may feel certain of like services from me in similar circumstances.” This pledge was redeemed in 1908, when Germany’s support of Austria in the Balkan crisis proved conclusive. By the Hungarians, however, Goluchowski was hated; he was suspected of having inspired the emperor’s opponents in their campaign to drive the Hungarian army, and was made responsible for the slight offered to the Magyar deputation by Francis Joseph in September 1905. So long as he remained in office there was no hope of arriving at a settlement of a matter which threatened the disruption of the Dual monarchy, and on the 11th of October 1906 he was forced to resign.

GOMAL, or GUMAL, the name of a river of Afghanistan, and of a mountain pass on the Dera Ismail Khan border of the North-West Frontier Province of British India. The Gomal river, one of the most important rivers in Afghanistan, rises in the unexplored regions to the south-east of Ghazni. Its chief tributary is the Zhob. Within the limits of British territory the Gomal forms the boundary between the North-West Frontier Province and Baluchistan, and more or less between the Pathan and Baluch races. The Gomal pass is the most important pass on the Indian frontier between the Khyber and the Bolan. It connects Dera Ismail Khan with the Gomal valley in Afghanistan, and has formed for centuries the outlet for the povindah trade. Until the year 1890 this pass was almost unknown to the Anglo-Indian official; but in that year the government of India decided that, in order to maintain the safety of the railway as well as to perfect communication between Quetta and the Punjab, the Zhob valley should, like the Bori valley, be brought under British protection and control, and the Gomal pass should be opened. After the Waziristan expedition of 1894 Wana was occupied by British troops in order to dominate the Gomal and Waziristan; but on the formation of the North-West Frontier Province in 1901 it was decided to replace these troops by the South Waziristan militia, who now secure the safety of the pass.

GOMARUS, FRANZ (1563-1641), Dutch theologian, was born at Bruges on the 30th of January 1563. His parents, having embraced the principles of the Reformation, emigrated to the Palatinate in 1578, in order to enjoy freedom to profess their new faith, and they sent their son to be educated at Strassburg under Johann Sturm (1507-1589). He remained there three years, and then went in 1586 to Neustadt, whither the professors of Heidelberg had been driven by the elector-palatine because they were not Lutherans. Here his teachers in theology were Zacharius Ursinus (1534-1583), Hieronymus Zanchius (1590-1650), and Daniel Tossanus (1541-1602). Crossing to England towards the end of 1582, he attended the lectures of John Rainolds (1549-1607) at Oxford, and those of William Whiter (1548-1593) at Cambridge. He graduated at Cambridge in 1584, and then went to Heidelberg, where the faculty had been by this time re-established. He was pastor of a Reformed Dutch church in Frankfurt from 1587 till 1593, when the congregation was dispersed by persecution. In 1594 he was appointed professor of theology at Leiden, and before going thither received from the university of Heidelberg the degree of doctor. He taught quietly at Leiden till 1603, when Jakobus Arminius came to be one of his colleagues in the theological faculty, and began to teach Pelagian doctrines and to create a new party in the university. Gomarus immediately set himself earnestly to oppose these views in his classes at college, and was supported by Johann B. Bogermann (1570-1637), who afterwards became professor of theology at Franeker. Arminius “sought to make election dependent upon faith, whilst they sought to enforce absolute predestination as the rule of faith, according to which the whole Scriptures are to be interpreted” (J. A. Dorner, History of Protestant Theology, i. p. 417). Gomarus then became the arch-athority of Arminianism, and was the first from that circumstance came to be known as Gomarists. He engaged in a personal dispute with Arminius in the assembly of the estates of Holland in 1608, and was one of five Gomarists who met five Arminians or Remonstrants in the same assembly of 1609. On the death of Arminius shortly after this time, Konrad Vorstius (1560-1622), who sympathized with his views, was appointed to succeed him, in spite of the keen opposition of Gomarus and his friends; and Gomarus took his defeat so ill that he resigned his post, and went to Middleburg in 1611, where he was made a professor at the Reformed church, and taught theology and Hebrew in the newly founded Illustre Schule. From this place he was called in 1614 to a chair of theology at Saumur, where he remained four years, and then accepted a call as professor of theology and Hebrew to Groningen, where he stayed, till his death on the 11th of January 1641. He took a leading part in the synod of Dort, assembled in 1618 to judge of the doctrines of Arminius. He was a man of ability, enthusiasm and learning, a considerable Oriental scholar, and also a keen controversialist. He took part in revising the Dutch translation of the Bible, was present at Dort in 1618, and after his death a book by him, called the Lyra Davidis, was published, which sought to explain the principles of Hebrew metre, and which created some controversy at the time, having been opposed by Louis Cappel. His works were collected and published in one volume folio, in Amsterdam in 1645. He was succeeded at Groningen in 1643 by his pupil Samuel Marsues (1590-1673).

GOMBERVILLE, MARIN LE ROY, SIEUR DU PARC ET DE (1600-1674), French novelist and miscellaneous writer, was born at Paris in 1600. At fourteen years of age he wrote a volume of verse, as a young man. Drame sur l’histoire and at twenty-two a pastoral, La Carillette, which is really a novel. The persons in it, though still disguised as shepherds and shepherdesses, represent real persons for whose identification the author himself provides a key. This was followed by a more ambitious attempt, Polexandre (5 vols. 1632-1637). The hero wanders through the world in search of the island home of the princess Alcidiana. It contains much history and geography; the travels of Polexandre extending to such unexpected places as Benin, the Canary Islands, Mexico and the Antilles, and incidentally we learn all that was then known of Mexican history. Cythère (4 vols.) appeared in 1630-1642, and in 1651 the Jeune Alcidiana, intended to undo any harm the earlier novels may have done, for Gomberville became a Jansenist and spent the last twenty-five years of his life in pious retirement. He was one of the earliest and most energetic members of the Academy. He died in Paris on the 14th of June 1674.

GOMER, the biblical name of a race appearing in the table of nations (Gen. x. 2), as the “eldest son” of Japheth and the “father” of Ashkenaz, Riphath and Togarach; and in Ezek. xxxviii. 6 a companion of the “sons of Gog” (Gen. xii. 13, 19); Gomer and Togarach being credited with “horses.” E. V., “bands” or “armies.” The “sons” of Gomer are probably tribes of north-east Asia Minor and Armenia, and Gomer is identified with the Cimmerians. These are referred to in cuneiform inscriptions under the Assyrian name gimirmir (gimmir) as raiding Asia Minor from the north and north-east of the Black

1 ηρΑγοφ, a word peculiar to Ezekiel, Clarendon Press Heb. Lex.
Sea, and overrunning Lydia in the 7th century B. C. (see Kimber, Scythia, Lydia). They do not seem to have made any permanent settlements, unless some such are indicated by the fact that the Armenians called Cappadocia Ganir. It is, however, suggested that this name is borrowed from the Old Testament. 1

The name Gomez (Gomer bath Diblaim) was also borne by the unfaithful wife of Hosea, whom he pardoned and took back (Hosea 1: 3). Hosea uses these incidents as symbolic of the sin, punishment and redemption of Israel, but there is no need to regard Gomez as a purely imaginary person.

(W. H. Be.)

GOMERA, an island in the Atlantic Ocean, forming part of the Spanish archipelago of the Canary Islands (q. v.). Pop. (1900) 15,358; area 144 sq. m. Gomez lies 20 m. W.S.W. of Tenerife. Its greatest length is about 29 m. The coast is precipitous and the interior mountainous, but Gomez has the most wind and is the best watered of the group. The inhabitants are very poor. Dromedaries are bred on Gomez in large numbers. San Sebastian (1817) is the chief town and a port. It was visited by Columbus on his first voyage of discovery in 1492.

GOMEZ, DIOGO (Diogo) (fl. 1440-1452), Portuguese seaman, explorer and writer. We first trace him as a cavaleiro of the royal household; in 1440 he was appointed receiver of the royal customs. In 1445 he was captain of a Carina (just dos causos or galera) of the fleet which left Portugal on the 5th of March 1482 he was confirmed in the last-named office. He wrote, especially for the benefit of Martin Behaim, a Latin chronicle of great value, dealing with the life and discoveries of Prince Henry the Navigator, and divided into three parts: (1) De primo inventione Guinea; (2) De insulis primo inventis in mare (sic) Occidentis; (3) De inventione insulorum de Azores. This chronicle contains the only contemporary account of the rediscovery of the Azores by the Portuguese in Prince Henry's service, and is also noteworthy for its clear description of the prince's method of operation, and commercial purpose in exploration. For, on the one hand, the infante sent out his caravels to search for new lands (ad quaerendas terras) from his wish to know the more distant parts of the western ocean, and in the hope of finding islands or terra firma beyond the limits laid down by Ptolemy (ultra descriptionem Tolomieti); on the other hand, his information as to the native trade from Tunis to Timbuktu and the Gambia helped to inspire his persistent exploration of the Western African coast—

"to seek those lands by way of the sea. Chart and quadrant were used, improved, and in the 1440s, the Gama voyage under the Cape Verde Islands; Henry, at the time of Diogo's first voyage, was in correspondence with an Arab merchant who kept him informed upon events even in the Gambia hinterland; and, before the discovery of the Senegal and Cape Verde in 1445, Gomez' royal patron had already gained reliable information of some route to Timbuktu. In the first part of his chronicle Gomez tells how, no long time after the disastrous expedition of the Danish nobleman " Vallarte " (Adalbert) in 1448, he was sent out in command of three vessels along the West African coast, accompanied by one Jacob, an Indian interpreter, to be employed in the event of reaching India. After passing the Rio Grande, beyond Cape Verde, strong currents checked his course; his officers and men feared that they were approaching the extremity of the ocean, and he put back to the Gambia. He ascended this river a considerable distance, to the negro town of " Cantor," whither natives came from " Kukin " and Timbuktu for trade; he gives elaborate descriptions of the negro world he had now penetrated, refers to the Sierra Leone (" Sierra Loa ") Mountains, sketches the course of this range, and says much of Kukin (in the upper basin of the river), the centre of the West African gold trade, and the region of merchants and caravans from Tunis, Fez, Cairo and " all the land of the Saracens." Mahomedanism was already dominant at the Cambria estuary, but Gomez seems to have won over at least one important chief, with his court, to Christianity and Portuguese allegiance. Another African voyage, apparently made in 1462, two years after Henry

1 A. Jeremias, Das A.T. im Lichte des aliens Orient, pp. 145 f. the Navigator's death (though assigned by some to 1460), resulted in a fresh discovery of the Cape Verde Islands, already found by Cacadosto (q. v.). To the island of Santiago Gomez, like his Venetian forerunner, claims to have given its present name. His narrative is a leading authority on the last illness and death of Prince Henry, as well as on the life, achievements and purposes of the latter; here alone is recorded what appears to have been the earliest of the navigator's exploring ventures, that which under João de Tostao reached Grand Canary in 1415.

GOMEZ DE AVELLANEDA, GERTRUDIS (1814-1873), Spanish dramatist and poet, was born at Puerto Príncipe (Cuba) on the 23rd of March 1814, and removed to Spain in 1836. Her Poetas líricos (1841), issued with a laudatory preface by Gallego, made a most favourable impression and were republished with additional poems in 1857.

The dramatist named Pedro Sabater, became a widow within a year, and in 1853 married Colonel Domingo Verdugo. Meanwhile she had published Sab (1839), Guatimozín (1846), and other novels of no great importance. She obtained, however, a series of successes on the stage with Alfonso Munio (1844), a tragedy in the new romantic manner; with Suáel (1849), a biblical drama indirectly suggested by Alférez; and with Baltasar (1858), a piece which bears some resemblance to Byron's Sardanapalus. Her comedy with the world had not diminished her natural piety, and, on the death of her second husband, she found so much consolation in religion that she had thoughts of entering a convent. She died at Madrid on the 2nd of February 1873, full of mournful forebodings as to the future of her adopted country. It is impossible to agree with Villemain that "le génie de don Luis de Léon et de sainte Thérèse a reparu sous le voile funèbre de Gomez de Avellaneda," for she has neither the monk's mastery of poetic form nor the nun's sublime simplicity of soul. She has a grandiose tragical vision of life, a vigorous eloquence rooted in pietistic pessimism, a dramatic gift effective in isolated acts or scenes; but she is deficient in constructive vigour and in intellectual force, and her lyrics, though gay with melancholy beauty, or the tenderness of resigned devotion, too often lack human passion and sympathy. The edition of her Obras literarias (5 vols., 1860-1871), still incomplete, shows a scrupulous care for minute revision uncommon in Spanish writers; but her emendations are seldom happy. But she is interesting as a link between the classic and romantic schools of poetry, and, whatever her artistic shortcomings, she has no rivals of her own sex in Spain during the 19th century.

GOMM, SIR WILLIAM MAYNARD (1794-1873), British soldier, was connected in 1812 with Foot as captain of the 29th in recognition of the services of his father, Lieut.-Colonel William Gomm, who was killed in the attack on Guadaloupe (1764). He joined his regiment as a lieutenant in 1799, and fought in Holland under the duke of York, and subsequently was with Pulteney's Ferrol expedition. In 1803 he became Captain, and shortly afterwards qualified as a staff officer at the High Wycombe military college. On the general staff he was with Cathcart at Copenhagen, with Wellington in the Peninsula, and on Moore's staff at Corunna. He was also on Chatham's staff in the disastrous Walcheren expedition of 1809. In 1810 he rejoined the Peninsula and in 1813 was appointed a staff officer, and took part in all the battles of 1810, 1811 and 1812, winning his majority after Fuentes d'Onor and his lieutenant-colonelcy at Salamanca. His careful reconnaissances and skilful leading were invaluable to Wellington in the Vittoria campaign, and to the end of the war he was one of the
most trusted men of his staff. His reward was a transfer to the Coldstream Guards and the K.C.B. In the Waterloo campaign he served on the staff of the 5th British Division. From the time until 1839 he was employed on home service, becoming colonel in 1829 and major-general in 1837. From 1839 to 1842 he served with the troops in Jamaica. He became lieutenant-general in 1846, and was sent out to be commander-in-chief in India, arriving only to find that his appointment had been cancelled in favour of Sir Charles Napier, whom, however, he eventually succeeded (1850–1855). In 1854 he became general and in 1868 field marshal. In 1872 he was appointed constable of the Tower, and he died in 1875. He was twice married, but had no children. His Letters and Journals were published by F. C. Carr-Gomm in 1881. Five "Field Marshal Gomm" scholarships were afterwards founded in his memory at Keble College, Oxford.

GOMPERZ, SAMUEL (1850— ), American labour leader, was born in London on the 27th of January 1850. He was put to work in a shoe-factory when ten years old, but soon became apprenticed to a cigar-maker, removed to New York in 1863, became a prominent member of the International Cigar-makers' Union, was its delegate at the convention of the Federation of Organized Trade and Labor Unions of the United States and Canada, later known as the American Federation of Labor, of which he became first president in 1882. He was successively re-elected up to 1895, when the opposition of the Socialist Labor Party, then attempting to incorporate the Federation into itself, secured his defeat; he was re-elected in the following year. In 1894 he became editor of the Federation's organ, The American Federationist.

GOMPERZ, THEODOR (1832— ), German philosopher and classical scholar, was born at Brunn on the 29th of March 1832. He studied at Brunn and at Vienna under Herman Bonitz. Graduating at Vienna in 1867 he became Privatdozent, and subsequently professor of classical philology (1873). In 1881, when he was elected a member of the Academy of Science. He received the degree of Doctor of Philosophy honoris causa from the university of Königsberg, and Doctor of Literature from the universities of Dublin and Cambridge, and became correspondent for several learned societies. His principal works are: Demosthenes der Staatsmann (1864), Philodemos de ira uber (1864), Traumerei und Zauberbi (1866), Herodotische Studien (1865–1866), Beitrage zur Kritik und Erklarung griech. Schriftsteller (7 vols., 1875–1900), Neue Bruchstuecke Epikurs (1878), Die Bruchstuecke des Aristoteles (1879), Die griech. Tragiker, und Golfs neueste griechische Manier (1878), Herodotische Studien (1881). Ein bisher unbekanntes griech. Schriftsystem (1884), Zu Philodems Buechern von der Musik (1885), Uber den Abschluss des herodotischen Geschichtswerkes (1886), Platoniische Aufsatze (3 vols., 1887–1905), Zur Heraklits Lehre und den Uberresten seines Werkes (1887), Zu Aristoteles' Poetik (2 parts, 1888–1896), Uber die Charaktere Theophrasts (1888), Nachleue zu den Bruchstucken der griech. Tragiker (1888), Die Apologie der Heilkunst (1890), Philodem und die athenschen Schriften der herodotischen Bibliothek (1891), "Die Schrift vom Staatszwergen der Athenner" (1893), Die jüngst entdeckten Uberreste einer der Platonischen Philoiten entstammenden Pyramydrolle (1892), Aus der Hekale des Kallimachos (1893), Essays und Erinnerungen (1905). He supervised a translation of J. S. Mill's complete works (12 vols., Leipzig, 1860–1880), and wrote a life (Vienna, 1889) of Mill. His Griechische Denker: Geschichte der antiken Philosophie (vols. i. and ii., Leipzig, 1893 and 1902) was translated into English by L. Magnus (vol. I., 1901).

GONCHAROV ("borderers"), descendants of a very old cross between the Hottentots and the Kafrirs, on the "ethnical divide" between the two races, apparently before the arrival of the whites in South Africa. They have been always a despised race and regarded as outcasts by the Bantu peoples. They were threatened with extermination during the Kafrir wars, but were protected by the British. At present they live in settled communities under civil magistrates without any tribal organization, and in some districts could be scarcely distinguished from the other natives but for their broken Hottentot-Dutch-English speech.

GONÇALVES DIAS, ANTONIO (1823–1864), Brazilian lyric poet, was born near the town of Caxias, in Maranhão. From the University of Coimbra, in Portugal, he returned in 1845 to his native province, well-equipped with legal lore, but the literary tendency which was strong within him led him to try his fortune in Brazil. He was elected to the Brazilian Senate, and when in 1846 he was called to the press, ventured to appear as a dramatist, and in 1846 established his reputation by a volume of poems—Primeros Cantos—which appealed to the national feelings of his Brazilian readers, were remarkable for their autobiographic impress, and by their beauty of expression and rhythm placed their author at the head of the lyric poets of his country. In 1848 he followed up his success by Segundos Cantos e setllhas de Prél Antônio, in which, as the title indicates, he puts a number of the pieces in the mouth of a simple old Dominican friar; and in the following year, in fulfilment of the duties of his new post as professor of Brazilian history in the Imperial College of Pedro II. at Rio de Janeiro, he published an edition of Berredo's Annaes historicos de Maranhao and added a sketch of the migrations of the Indian tribes. A third volume of poems, which appeared with the title of Ultimos Cantos in 1851, was practically the poet's farewell to the service of the muse, for he spent the next eight years engaged under government patronage in studying the state of public instruction in the north and the educational institutions of Europe. On his return to Brazil in 1860 he was appointed a member of an expedition for the exploration of the province of Ceará, was forced in 1862 by the state of his health to try the effects of another visit to Europe, and died in September 1864, the vessel that was carrying him being wrecked off his native shores. While in Germany he published at Leipzig a complete collection of his lyrical poems, which went through several editions, the four first cantos of an epic poem called Os Tymbiras (1852) and a Dicionario da lingua Tupy (1858).

A complete edition of the works of Dias has made its appearance as a 4 vol. set by Bernardo de Jesus da Silva, Dicionario bibliografico portugue, viii. 157; Soteros dos Reis, Curso de literatura portugueza e brasileira, i. (Maranhao, 1868). José Verissimo, Estudos de literatura brasileira, segunda serie (Rio, 1901).

GONCHAROV, IVAN ALEXANDROVICH (1812–1891), Russian novelist, was born 6/18 July 1812, being the son of a rich merchant in the town of Simbirsk. At the age of ten he was placed in one of the gymnasiums at Moscow, from which he passed, though not without some difficulty on account of his ignorance of Greek, into the Moscow University. He read many French works of fiction, and published a translation of one of the novels of Eugene Sue. During his university career he devoted himself to the study of law, during his vacations spending some time among his fellow-students. He was first employed as secretary to the governor of Simbirsk, and afterwards in the ministry of finance at St Petersburg. Being absorbed in bureaucratic work, Goncharov paid no attention to the social questions then ardently discussed by such men as Herzen, Aksakov and Bielinski. He began his literary career by publishing translations from Schiller, Goethe and English novelists. His first original work was Obukhovennaya Istoria, "A Common Story" (1847). In 1856 he sailed to Japan as secretary to Admiral Putiatin for the purpose of negotiating a commercial treaty, and on his return to Russia he published a description of the voyage under the title of "The Frigate Pallada." His best work is Oblomov (1857), which exposed the laziness and apathy of the smaller landed gentry in Russia anterior to the reforms of Alexander II. Russian critics have pronounced this work to be a faithful characterization of Russia and the Russians. Dobrolyubov said of it, "Oblomofka [the country-seat of the Oblomovs] is our fatherland: something of Oblomov is to be found in every one of us." Peessar, another celebrated critic, declared that "Oblomovism," as Goncharov called the sum total of qualities with which he invested the hero of his story, "is an illness fostered by the nature of the Slavonic character and the life of Russian society." In 1858 Goncharov was appointed a censor, and in 1868 he published another novel called Obreen. He was not a voluminous writer, and during the latter part of his life produced nothing of any importance. His death occurred on 15/27 September 1891.
GONCOURT—GONDAL

GONCOURT, DE, a name famous in French literary history. Edmond Louis Antoine Huot de Goncourt was born at Nancy on the 26th of May 1822, and died at Champrosay on the 16th of July 1896. Jules Alfred Huot de Goncourt, his brother, was born in Paris on the 17th of December 1830, and died in Paris on the 20th of June 1870.

Writing always in collaboration, until the death of the younger, it was their ambition to be not merely novelists, inventing a new kind of novel, the historic novel; not merely historians, but the historians of a particular century, and of what was intimate and what is unknown in it; to be also disinterested, indeed innovating, critics of art, but of a certain section of art, the 18th century, in France and Japan; and also to collect pictures and bibelots, always of the French and Japanese 18th century. Their histories (Portraits intimes du XVIIIe siècle (1857), La Femme au XVIIIe siècle (1862), La du Barry (1858), &c.) are made entirely out of documents, autograph letters, scraps of costume, engravings, songs, the unconscious self-revelations of the time; their three volumes on L'Art du XVIIIe siècle (1859-1875) deal with Watteau and his followers in the same scrupulous, minute enlightening way, with all the detail of unpublished documents; and when they came to write novels, it was with a similar attempt to give the inner, undiscovered, minute truths of contemporary existence, the intimité of life. The same morbidly sensitive noting of the inédit, of whatever came to them from their own sensations of things and people around them, gives its curious quality to the nine volumes of the Journal, 1857-1866, which will perhaps, the truest and most poignant chapter of human history that has ever been written. Their novels, Sœur Philomène (1861), Rendez Maupeou (1864), Germinie Lacerteux (1865), Manette Salomon (1866), Madame Bovary (1857), and, by Edmond alone, La Fille Elise (1878), Les Frères Zemmour (1879), La Faustine (1883), Chérin (1884), are, however, the work by which they will live as artists. Learning something from Flaubert, and teaching almost everything to Zola, they invented a kind of novel, and their novels are the result of a new vision of the world, in which the very element of sight is dere priority, as in a picture of Monet. Seen through the nerves, in this conscious abandon ment to the tricks of the eyesight, the world becomes a thing of broken patterns and conflicting colours, and uneasy movement. A novel of the Goncourts is made up of an infinite number of details, set side by side, every detail equally prominent. While a novel of Flaubert, for all its detail, gives above all things an impression of unity, a novel of the Goncourts deliberately dispenses with unity in order to give the sense of the passing of the life, and the heat and form of its moments as they pass. It is written in little chapters, sometimes no longer than a page, and each chapter is a separate little world, though some suggest a single strike or sensation which seems to throw sudden light on the picture of a soul. To the Goncourts humanity is as pictorial a thing as the world it moves in; they do not search further than "the physical basis of life," and they find everything that can be known of that unknown force written visibly upon the sudden faces of little incidents, little expressive moments. The soul, to them, is a series of moods, which succeed one another, certainly without any of the too arbitrary logic of the novelist who has conceived of character as a series of preconceived moods. Their novels stand out all, but picture-galleries, hung with pictures of the momentary aspects of the world. French critics have complained that the language of the Goncourts is no longer French, no longer the French of the past; and this is true. It is their distinction—the finest of their inventions—that, in order to render new sensations, they invented a new language. (A. S.)

In his will Edmond de Goncourt left his estate for the endowment of an academy of literature. The members of the academy was entitled MM. Alphonse Daudet and Léon Hennique. The society was to consist of ten members, each of whom was to receive an annuity of 6000 francs, and a yearly price of 5000 francs was to be awarded to the author of some work of fiction. Eight of the members of the new academy were nominated in the will. They were: Alphonse Daudet, J. K. Huysmans, Léon Hennique, Octave Mirbeau, the two brothers J. H. Rosny, Gustave Geffroy and Paul Margueritte. On the 10th of January 1903, after much litigation, the academy was constituted, with Elémir Bourges, Lucien Descaves and Léon Daudet as members in addition to those nominated in de Goncourt's will, the place of Alphonse Daudet having been left vacant by his death in 1897.

On the brothers de Goncourt see the Journal des Goncourt already cited; also M. A. Bellon (afterwards Lowndes) and M. L. Shedlock, Editors of Jules de Goncourt and Louis de Goncourt, their Journals (1865); Alidor Delzant, Les Goncourt (1886) which contains a valuable bibliography; Lettres de Jules de Goncourt (1888), with preface by H. Céard; R. Dounie, Portraits d'auteurins (1892); Paul Doumer, Gousseaux et le roman de la planète (1886); Émile Zola, Les Romanciers naturalistes (1881), &c.

GONDA, a town and district of British India, in the Fyzabad division of the United Provinces. The town is 28 m. N.W. of Fyzabad, and is an important junction on the Bengal & North-Western railway. The site on which it stands was originally a jungle, in the centre of which was a cattle-field (Gontha or Gohok), where the cattle were enclosed at night as a protection against wild beasts, and from this the town derives its name. Pop. (1901) 15,811. The cantonments were abandoned in 1863.

The district of Gonda has an area of 2835 sq. m. It consists of a vast chain with very slight undulations, studded with groves of mango trees. The surface consists of a rich alluvial deposit which is naturally divided into three great belts known as the tarai or swampy tract, the uparar or uplands, and the tarhar or wet lowlands, all three being marvellously fertile. Several rivers flow through the district, but only two, the Gogra and Rapti, are of any commercial importance, the first being navigable throughout the year, and the latter during the rainy season. The country is dotted with small lakes, the water of which is largely used for irrigation. On the outskirts of the town an immense area of land is being progressively occupied by European officers under the scheme of settlement. The town was then a small village, and the first European officer to arrive was Mr. Gray, who opened the town to immigration as far as it lay between the river and the railway. Immigration has been very rapid, and the town is now a large and thriving place. It has an important railway station, and is the centre of an extensive trade in cotton goods and other manufactured articles. The district is traversed by the main line and three branches of the Bengal & North-Western railway.

GONDAZ, a native state of India, in the Kathiawar political agency of Bombay, situated in the centre of the peninsula of Kathiawar. Its area is 1024 sq. m.; pop. (1901) 162,850. The estimated gross revenue is about £300,000, and the tribute £7000. Grain and cotton are the chief products. The chief, whose title is Thakur Sahib, is a Jadeja Rajput, of the same clan as the Rao of Cutch. The Thakur Sahib, Sir Bhagvat Sinjhi (b. 1865), was educated at the Rajkot college, and afterwards graduated in arts and medicine at the university of Edinburgh. He published (in English) a Journal of a Visit to England and A Short History of Arvon Medical Science. In 1892 he received the honorary degree of D.C.L. of Oxford University. He was created K.C.I.E. in 1887 and G.C.I.E. in 1897. The state has long been conspicuous for its progressive administration. It is traversed by a railway connecting it with Bhunaagar, Rajkot and the sea-board. The town of Gondal is 23 m. by rail S. of Rajkot; pop. (1901) 19,592.

GONDAR, properly Guendar, a town of Abyssinia, formerly the capital of the Amharic kingdom, situated on a basaltic ridge some 7500 ft. above the sea, about 21 m. N.E. of Lake Tsana, a splendid view of which is obtained from the castle. Two streams, the Angereb and the Lenti, flow from the ridge, and meeting below the town, pass onwards to the lake. In the early years of the 20th century the town was much decayed, numerous ruins of castles, palaces and churches indicating its former importance. It was never a compact city, being divided into districts separated from each other by open spaces. The chief quarters were those of the Abun-Bed or bishop, the Etchge-Bed or chief of the monks, the Debra Berhan or Church of the Light, and the Gemp or castle. There was also a quarter for the Mahommedans. Gondar was a small village when at the beginning of the 16th century it was chosen by the Negus Syenach (Seged I.) as the capital of his kingdom. His son Asfildas, or Alem-Seged (1633-1667), was the builder of the castle which bears his name. Later emperors built other castles and palaces, the latest in date being
that of the Negus Yesu II. This was erected about 1736, at which time Gondar appears to have been at the height of its prosperity. Thereafter it suffered greatly from the civil wars which raged in Abyssinia, and was more than once sacked. In 1868 it was much injured by the emperor Theodore, who did not spare either the castle or the churches. After the defeat of the Abyssinians at Debra Sin in August 1887, Gondar was looted and fired by the dervishes under AbuAnga. Although they held the town but a short time they inflicted very great damage, destroying many churches, further damaging the castles and carrying off much treasure. The population, estimated by James Bruce in 1770 at 10,000 families, had dwindled in 1895 to about 7000. Since the pacification of the Sudan by the British (1896-1898) there has been some revival of trade between Gondar and the regions of the Blue Nile. Among the inhabitants are numbers of Mahomedans, and there is a settlement of Falashas. Cotton, cloth, gold and silver ornaments, copper wares, fancy articles in bone and ivory, excellent saddles and shoes are among the products of the local industry.

Unlike any other buildings in Abyssinia, the castles and palaces of Gondar resemble, with some modifications, the medieval fortresses of Europe, the style of architecture being the result of the presence in the country of numbers of Portuguese. Thus the Abyssinians were expelled by Fasilides, but his castle was built, by Indian workmen, under the superintendence of Abyssinians who had learned something of architecture from the Portuguese adventurers, helped possibly by Portuguese still in the country. The castle has two storeys, is 90 ft. by 84 ft., has a square tower and circular domed towers at the corners. The most extensive ruins are a group of royal buildings enclosed in a wall. These ruins include the palace of Yesu II, which has several fine chambers. Christian Levantines were employed in its construction and it was decorated in part with Venetian mirrors, &c. In the same enclosure is a small castle attributed to Yesu I. The exterior walls of the castles and palaces named are little damaged and give to Gondar a unique character among African towns. Of the forty-four churches, all in the circular Abyssinian style, which are said to have formerly existed in Gondar or its immediate neighbourhood, Major Powell-Cotton found only one intact in 1900. This church contained some well-executed native paintings of St George and the Dragon, The Last Supper, &c. Among the religious observances of the Christians is that of bathing in large crowds in the Gala, on the Feast of the Baptism, and again, though in more orderly fashion, on Christmas day.

GONDOKORO, a government station and trading-place on the east bank of the upper Nile, in 4° 54' N., 34° 45' E. It is the headquarters of the Northern Province of the British Uganda protectorate, is 1070 m. by river S. of Khartum and 350 m. N.N.W. in a direct line of Entebbe on Victoria Nyanza. The station, which is very unhealthy, is at the top of a cliff 25 ft. above the river-level. Besides houses for the civil and military authorities and the lines for the troops, there are a few huts inhabited by Bari, the natives of this part of the Nile. The importance of Gondokoro lies in the fact that it is within a few miles of the limit of navigability of the Nile from Khartum up stream. From this point the journey to Uganda is continued overland.

Gondokoro was first visited by Europeans in 1841-1842, when expeditions sent out by Mehmet Ali, pasha of Egypt, ascended the Nile as far as the foot of the rapids above Gondokoro. It soon became an ivory and slave-trading centre. In 1851 an Austrian Roman Catholic mission was established here, but it was abandoned in 1856. It was at Gondokoro that J. H. Speke and J. A. Grant, descending the Nile after their discovery of its source, met, on the 15th of February 1862, Mr (afterwards Sir) Samuel Baker and his wife who were journeying up the river. In 1871 Baker, then governor-general of the equatorial provinces of Egypt, established a military post at Gondokoro which he named Ismailis, after the Khedive. Baker made this post his headquarters, but in 1879 (afterwards General) Gordon, who succeeded him in 1874, abandoned the station on account of its unhealthy site, removing to Lado. Gondokoro, however, remained a trading-station. It fell into the hands of the Mahdists in 1885. After the destruction of the Mahdist power in 1898 Gondokoro was occupied by British troops and has since formed the northernmost post on the Nile of the Uganda protectorate (see SUDBAN; NILE; and UGANDA).

GONDOMAR, DIEGO SARMIENTO DE AGUÑA, Count of (1560-1626), Spanish diplomatist, was the son of Garcia Sarmiento de Sotomayor, corregidor of Granada, and governor of the Canary Islands, by his marriage with Juana de Acuña, an heiress. Diego Sarmiento, their eldest son, was born in the parish of Gondomar, in the bishopric of Tuy, Galicia, Spain, on the 1st of November 1567. He inherited wide estates both in Galicia and in Old Castile. In 1583 he was appointed by Philip II. to the military command of the Portuguese frontier and sea coast of Galicia. He is said to have taken an active part in the repulse of an English coast-raid in 1585, and in the defence of the country during the unsuccessful English attack on Corunna in 1589. In 1593 he was named corregidor of Toro. In 1603 he was sent from court to Vigo to superintend the distribution of the treasure brought from America by two galleons which were driven to take refuge at Vigo, and on his return was named a member of the board of finance. In 1609 he was again employed on the coast of Galicia, this time to repel a naval attack made by the Dutch. Although he held military commands, and administrative posts, his habitual residence was at Valladolid, where he owned the Casa del Sol and was already collecting his fine library. He was known as a courtier, and apparently as a friend of the favourite, the duke of Lerma. In 1612 he was chosen as ambassador in England, but did not leave to take up his appointment till May 1613.

His reputation as a diplomatist is based on his two periods of service in England from 1613 to 1618 and from 1619 to 1622. The excellence of his latinity pleased the literary tastes of James I., whose character he judged with remarkable insight. He flattered the king's love of books and of peace, and he made skilful use of his desire for a matrimonial alliance between the prince of Wales and a Spanish Infanta. The ambassador's task was to keep James from aiding the Protestant states against Spain and the house of Austria, and to avert English attacks on Spanish possessions in America. His success made him odious to the anti-Spanish and puritan parties. The active part he took in promoting the execution of Sir Walter Raleigh aroused particular animosity. He was attacked in pamphlets, and the dramatist Thomas Middleton made him a principal person in the strange political play A Game of Chess, which was suppressed by order of the council. In 1617 Sarmiento was created count of Gondomar. In 1618 he obtained leave to come home for his health, but was ordered to return by way of Flanders and France with a diplomatic mission. In 1619 he returned to London, and remained till 1622, when he was allowed to retire. On his return he was named a member of the royal council and governor of one of the king's palaces, and was appointed to a complimentary mission to Vienna. Gondomar was in Madrid when the prince of Wales—afterwards Charles I.—made his journey there in search of a wife. He died at the house of the ambassador of Castile, near Haro in the Rioja, on the 2nd of October 1626.

Gondomar was twice married, first to his niece Beatrix Sarmiento, by whom he had no children, and then to his cousin Constanza de Acuña, by whom he had four sons and three daughters. The hatred he aroused in England, which was shown by constant jeers at the intestinal complaint from which he suffered for years, was the best tribute to the zeal with which he served his own master. Gondomar collected, both before he came to London and during his residence there, a very fine
library of printed books and manuscripts. Orders for the arrangement, binding and storing of his books in his house at Valladolid take a prominent place in his voluminous correspondence. In 1785 the library was ceded by his descendant and representative, the marqués of Mejía, King Charles III., and is now in the Royal Library at Madrid. A portrait of Gondomar, attributed to Valazquez, was formerly at Stowe. It was mezzotinted by Robert Cooper.

AUTHORITIES.—Gondomar's missions to England are largely dealt with in S. R. Gardiner's History of England (London, 1883–1884). In Spanish, Don Pascual de Gayangos wrote a useful and descriptive introduction to a publication of a few of his letters—Cinco Cartas politico-literarias de Don Diego Sarmiento de Acuña, Conde de Gondomar, issued at Madrid 1869 by the Sociedad de Bibliófilos of the Spanish Academy; and there is a life in English by F. H. Lyon (1910).

GONDOPHARES, or GONDOPHERES, an Indo-Parthian king who ruled over the Kabul valley and the Punjab. By means of his coins his accession may be dated with practical certainty at A.D. 21, and his reign lasted for some thirty years. He is notable for his association with St Thomas in early Christian tradition. The legend is that India fell to St Thomas, who showed unwillingness to start until Christ appeared in a vision and ordered him to serve King Gondophares and build him a palace. St Thomas accordingly went to India and suffered martyrdom there. This legend is not incompatible with what is known of the chronology of Gondophares' reign.

GONDCANA, the historical name for a large tract of hilly country in India which roughly corresponds with the greater part of the present Central Provinces. It is derived from the aboriginal tribe of Gonds, who still form the largest element in the population and who were at one time the ruling power. From the 12th to as late as the 18th century three or four Gond dynasties reigned over this region with a degree of civilization that seems surprising when compared with the existing condition of the people. They built large walled cities, and accumulated immense treasures of gold and silver and jewels. On the whole, they maintained their independence fairly well against the Mahomedans, being subject only to a nominal submission and occasional payment of tribute. But when the Mahatta invaders appeared, soon after the beginning of the 18th century, the Gond kingdoms offered but a feeble resistance and the aboriginal population fled for safety to the hills. Gondwana was thus included in the dominions of the Bhosra raja of Nagpur, from whom it finally passed to the Maratha in 1853.

The Gonds, who call themselves Koitur or "highlanders," are the most numerous tribe of Dravidian race in India. Their total number in 1901 was 2,886,919, of whom nearly two millions were enumerated in the Central Provinces, where they form 20% of the population. They have a language of their own, with many dialects, which is intermediate between the two great Dravidian languages, Tamil and Telugu. It is unwritten and has no literature, except a little provided by the missionaries. More than half the Gonds in the Central Provinces have now abandoned their own dialects, and have adopted Aryan forms of speech. This indicates the extent to which they have become Hinduized. The higher class among them, called Raj Gonds, have been definitely admitted into Hinduism as a pure cultivating caste; but the great majority still retain the animistic beliefs, ceremonial observances and impure customs of food which are common to most of the aboriginal tribes of India.

GONFALON (the late French and Italian form, also found in other Romanic languages, of gonfalon, which is derived from the O.H. Ger. gansfano, gund, war, and fano, flag, cf. Mod. Ger. Fahne, banner), a banner in Malachite or standard of the middle ages. It took the form of a small pennon attached below the head of a knight's lance, or when used in religious processions and ceremonies, or as the banner of a city or state or military order, it became a many-streamered rectangular ensign, frequently swinging from a cross-bar attached to a pole. This is the most frequent use of the word. The title of "gonfalonier," the bearer of the gonfalon, was in the middle ages both military and civil. It was borne by the counts of Vexin, as leaders of the men of Saint Denis, and when the Vexin was incorporated in the kingdom of France the title of Gonfalonier of Saint Denis passed to the kings of France, who thus became the bearers of the "gonfalon," as the banner of St Denis was called. "Gonfalonier" was the title of civic magistrates of various degrees of authority in many of the city republics of Italy, notably of Florence, Sienna and Lucca. At Florence the functions of the office varied. At first the gonfaloniers were the leaders of the various military divisions of the inhabitants. In 1203 was created the office of gonfalonier of justice, who carried out the orders of the signory. By the end of the 14th century the gonfalonier was the chief of the signory. At Lucca he was the chief magistrate of the republic. At Rome two gonfaloniers must be distinguished, that of the church and that of the Roman people; both offices were conferred by the pope. The first was usually granted to sovereigns, who were bound to defend the church and lead her armies. The second bore a standard with the letters S.P.Q.R. on any enterprise undertaken in the name of the church and the people of Rome, and also at ceremonies, processions, &c. This was granted by the pope to distinguished families. Thus the Cesarii held the office till the end of the 17th century. The Pamphili held it from 1686 till 1764.

GONGORA Y ARGOTE, LUIS DE (1561–1627), Spanish lyric poet, was born at Cordova on the 11th of July 1561. His father, Father Góngora Argote, was the subdeacon of the cathedral of Cordova; he adopted the surname of his mother, Leonora de Góngora, who

---

2 "Alte Metallrommeln aus Südost-Asien" (Leipzig, 1902), Bd. 1, Text; Bd. ii, Tafeln.
was descended from an ancient family. At the age of fifteen he entered as a student of civil and canon law at the university of Salamanca; but he obtained no academic distinctions and was content with an ordinary pass degree. He was already known as a poet in 1585 when Cervantes praised him in the Galatea; in this same year he took minor orders, and shortly afterwards was nominated to a canonry at Cordova. About 1605–1606 he was ordained priest, and thenceforth resided principally at Valladolid. His contemporaries remark, he "noted and stabbed at everything with his satirical pen." His circle of admirers was now greatly enlarged; but the acknowledgment accorded to his singular genius was both slight and tardy. Ultimately indeed, through the influence of the duke of Sandoval, he obtained an appointment as honorary chaplain to Philip III., but even this slight honour he was not permitted long to enjoy. In 1626 a severe illness, which seriously impaired his memory, compelled his retirement to Cordova, where he died on the 24th of May 1627. An edition of his poems was published almost immediately after his death by Juan Lopez de Vicaula; the frequently reprinted edition by Hoze did not appear till 1633. The collection consists of numerous sonnets, odes, ballads, songs for the guitar, and of certain larger poems, such as the Soledades and the Polifemo. Too many of them exhibit that tortuous elaboration of style (estilo culto) with which the name of Gongora is inseparably associated; but though Gongora has been justly censured for affected Latinisms, unnatural transpositions, strained metaphors and frequent obscurity, it must be admitted that he was a man of rare genius,—a fact cordially acknowledged by those of his contemporaries who were most capable of judging. It was only in the hands of those who imitated Gongora's style without inheriting his genius that culturasimo became absurd. Besides his lyrical poems Gongora is the author of a play entitled Las Fírmases de Isabel and of two incomplete dramas, the Comedia venatoria and El Doctor Carlino. The only satisfactory edition of his works is that published by R. Foulché-Delboe in the Bibliotheca Hispanica.

**Goniometer** (from Gr. γωνία, angle, and μέτρον, measure), an instrument for measuring the angles of crystals; there are two kinds—the contact goniometer and the reflecting goniometer. Nicolas Steno in 1669 determined the interfacial angles of quartz crystals by cutting sections perpendicular to the edges, plane angles of the sections being then the angles between the faces which are perpendicular to the sections. The earliest instrument was the contact goniometer devised by Carangeot in 1783.

The **Contact Goniometer** (or Hand-Goniometer).—This consists of two metal rules pivoted together at the centre of a graduated semi-circle (fig. 1). The instrument is placed with its plane perpendicular to an edge between two faces of the crystal to be measured, and the rules are brought into contact with the faces; this is best done by holding the crystal up against the light with the edge in the line of sight. The angle between the rules, as read on the graduated circle, gives the angle between the two crystal faces. In the two-circle goniometer the radius of the circle, then gives the angle between the two crystal faces. In the two-circle goniometer, consisting of jointed arms and protractors made of cardboard or celluloid.

![Fig. 1.—Contact Goniometer.](image1)

The Reflecting Goniometer.—This is an instrument of far greater precision, and is always used for the accurate measurement of the angles when small crystals with bright faces are available. As a rule, the smaller the crystal, the more even are its faces, and when these are smooth and bright they reflect sharply defined images of a bright object. By turning the crystal about an axis parallel to the edge between two faces, the image reflected from a second face may be brought into the same plane position as the first face; the angle through which the crystal has been rotated, is determined by a graduated circle to which the crystal is fixed, is the angle between the normals to the two faces.

Several forms of instruments depending on this principle have been devised, the earliest being the vertical-circle goniometer of W. H. Wollaston, made in 1800. This consists of a circle $m$ (fig. 2), graduated to degrees of arc and reading with the vernier $h$ to minutes, which turns with the milled head $t$ about a horizontal axis. The crystal is attached with wax (a mixture of bees-wax and pitch) to the holder $q$, and by means of the pivoted arcs it may be adjusted so that the edge between two faces (a zone-axis) is parallel, and coincident with, the axis of the instrument. The crystal-holder and adjustment-arms, together with the milled head $s$, are carried on an axis which passes through the hollow axis of the graduated circle, and may thus be rotated independently of the circle. In use, the goniometer is placed directly opposite to a window, with its axis parallel to the horizontal window-bars, and as far distant as possible. The eye is placed quite close to the crystal, and the image of an upper window-pane is reflected in what is termed a tailor's mirror or dust glass. This is done by turning the milled head $s$, the reading of the graduated circle having previously been observed. Without moving the eye, the milled head $i$, together with the crystal, is then rotated until the image from a second face is brought into the same position; the difference between the first and second readings of the graduated circle will then give the angle between the normals of the two faces.

Several improvements have been made on Wollaston's goniometer. The adjustment-arms have been modified; a mirror of black glass fixed to the stand beneath the crystal gives a reflected image of the signal, with which the reflectors of the circle on which the crystal can be more conveniently made to coincide; a telescope provided with cross-wires gives greater precision in the direction of the reflected rays of light; and with the telescope a collimator has sometimes been used.

A still greater improvement was effected by placing the graduated circle in a horizontal position, as in the instrument of E. Malus (1810), F. C. von Riese (1829) and J. Babinet (1839). Many forms of single-circle and double-circle goniometers have been constructed; they are provided with a telescope and collimator, and in construction are essentially the same as a spectrometer, with the addition of arrangements for adjusting and centring the crystal. The instrument shown in fig. 3 is made by R. Fues of Berlin. It has four concentric axes, which enable the crystal-holder $A$, together with the adjustment-arms $B$ and centring-slides $D$, to be raised or lowered, or to be rotated independently of the circle $H$; further, either the crystal-holder or the telescope $T$ may be rotated with the circle, while the other

![Fig. 2.—Vertical-Circle Goniometer.](image2)

![Fig. 3.—Horizontal-Circle Goniometer.](image3)
remains fixed. The crystal is placed on the holder and adjusted so that the edge (zone-axis) between two faces is coincident with the axis of the instrument. This forms the first stage of the process. The slit of the collimator C, and the image of the slit (signal) reflected from the crystal face is viewed in the telescope. The clamp a and slow-motion screw F enable the image to be brought into the center of the field of view. Rotation of the circle with respect to the vernier is read through the lens. The crystal and the circle are then rotated together until the image from a second face is brought into the field of view. The rotation of the stage which has been turned is the angle between the normals to the two faces. While measuring the angles between the faces of crystals the telescope remains fixed by the clamp B, while the crystal is rotated. This may be used as a refractometer or refractometer for determining, by the method of minimum deviation, the indices of refraction of an artificially cut prism or of a transparent crystal when the faces are suitably inclined to one another.

With a one-circle goniometer, such as described above, it is necessary to mount and re-adjust the crystal afresh for the measurement of each zone of faces (i.e., each set of faces intersecting in parallel edges); with very small crystals this operation takes a considerable time, and the minute faces are not readily identified again. Further, in certain cases, it is not possible to measure the angles between the faces nor to determine the position of small faces which do not lie in prominent zones on the crystal. These difficulties have been overcome by the use of a two-circle goniometer or theodolite-goniometer which as a whole is a vertical goniometer and goniometer head. The first two-circle was first employed by W. H. Miller in 1874. Special forms have been designed by E. S. Fedorov (1889), V. Goldschmidt (1893), S. Czapski (1893) and F. Stoeber (1898), which differ mainly in the optical system. In the vertical goniometer the crystal is set up and adjusted once for all, with the axis of a prominent zone parallel to the axis of either the horizontal or the vertical circle. As a rule, only in this zone do the angles between the faces of the same zone and the other faces, which need be observed only once, be fixed by the simultaneous readings of the two circles. These readings, corresponding to the polar distance and azimuth, or latitude and longitude readings of astronomical telescopes, must be plotted on a projection before the symmetry of the crystal is apparent; and laborious calculations are necessary in order to determine the indices of the faces and the angles between the faces of the same zone and the other faces of the crystal, or to test whether any three faces are accurately in a zone.

These disadvantages are overcome by adding still another graduated circle to the instrument, with its axis perpendicular to the axis of the vertical circle, thus forming a three-circle goniometer. With such an instrument measurements may be made in any zone or between any two faces without re-adjusting the crystal; further, the troublesome calculations are avoided, and, indeed, the instrument may be used for solving spherical triangles. Different forms of three-circle goniometers have been designed by G. F. H. Smith (1899 and 1904), E. S. Fedorov (1899 and 1904), and J. F. C. Rushworth (1900). Each instrument is equipped with a - two-, or three-circle goniometer for the measurement of the interfacial angles of crystals, and a refractometer for determining refractive indices by the prismatic method and the Abbe method. A thin, light crystal, usually a polymer, is fitted with accessory optical apparatus which enables it to be used for examining a crystal in parallel or convergent polarized light and for measuring the optic axial angle.

Apart from the instrument just described, the goniometer is devised for certain purposes; for instance, the inverted horizontal-circle goniometer of H. A. Miers (1903) for measuring crystals during their growth in the mother-liquid. A. E. Tutton (1894) has combined a goniometer with lapidaries' appliances for cutting section-plates and prisms from crystals accurately in any desired direction. The instrument is commonly employed for measuring the optic axial angle of biaxial crystals is really a combination of a goniometer with a polariscopic. For the optical investigation of minute crystals under the microscope, various forms of stage-goniometer with one, two or three graduated circles and with microscope attachments and cross-wires and a rotating graduated stage serves the purpose of a goniometer for measuring the plane angles of a crystal face or section, being the same in principle as the contact goniometer.

For fuller descriptions of goniometers reference may be made to the text-books of Crystallography and Mineralogy, especially to P. H. Groth, Physikalische Kristallographie (4th ed., Leipzig, 1905).

GONTAUT—GONZAGA

GONTAUT, MARIE JOSEPHINE LOUISE, DUCHESSE DE (1773-1857), was born in Paris on the 3rd of August 1773, daughter of Augustin François, comte de Montaut-Navalles, who had been governor of Louis XVI, and his two brothers when children. The count of Provence (afterwards Louis XVIII.) and his wife stood sponsors to Joséphine de Montaut, and she shared the lessons given by Madame de Genlis to the Orleans family, with whom her mother broke off relations after the outbreak of the Revolution. Mother and daughter emigrated to Coblenz in 1792; thence they went to Rotterdam, and finally to England, where Joséphine married the marquis Charles Michel de Gontaut-Saint-Blacard. They returned to France at the Restoration, and resumed their place at court. Madame de Gontaut became lady-in-waiting to Caroline, duchess of Berry, and, on the birth of the princess Louise (Mlle d'Artois, afterwards duchess of Parma), governor to the children of France. Next year the birth of Henry, duke of Bordeaux (afterwards known as the comte de Chambord), added to her charge the heir of the Bourbons. She remained faithful to his cause all her life. Her husband died in 1822, and in 1827 she was created duchesse de Gontaut. She followed the exiled royal family in 1830 to Holyrood Palace, and then to Prague, but in 1834, owing to differences with Pierre Louis, duc de Blacas, who thought her comparatively liberal views dangerous to the prince and princess, she received a brusque congé from Charles X. Her twin daughters, Joséphine (1796-1844) and Charlotte (1796-1818), married respectively Ferdinand de Chabot, prince de Léon and afterwards duc de Rohan, and François, comte de Bouron-Busat. She herself wrote in her old age some naïve memoirs, which throw an odd light on the pretensions of the "gouverness of the children of France." She died in Paris in 1857.

See her Memoirs (Eng. ed., 2 vols. 1894), and Lettres intimes (1893).

GONVILLE, EDMUND, VISCOUNT (d. 1537), founded Gonville Hall, Cambridge, England, is thought to have been the son of William de Givonville, and the brother of Nicholas Gonville. In 1320 he was rector of Thelnetham, Suffolk, and steward there for William, earl Warren and the elder of his two sons. Six years later he was rector of Rushworth, and in 1342 rector of Terington St John and commissioner for the marshlands of Norfolk. In this year he founded and endowed a collegiate church at Rushworth, suppressed in 1541. The foundation of Gonville Hall at Cambridge was effected by a charter granted by Edward III. In 1348, the King, in recognition of Rushworth's opposition to the Black Death, passed to him and his issue a house of 10 rooms, with his wife the Blessed Virgin, but was usually known as Gonnell or Gonville Hall. Its original site was in Free-school Lane, where Corpus Christi College now stands. Gonville apparently wished it to be devoted to training for theological study, but after his death the foundation was completed by William Bateman, bishop of Norwich and founder of Trinity Hall, on a different site and with considerably altered statutes. (See also Carus, John.)

GONZAGA, an Italian princely family named after the town where it probably had its origin. Its known history begins with the 13th century, when Luigi I. (1267-1366), after fierce struggles supplanted his brother-in-law Rinaldo (nicknamed Passerino) Bonacolsi as lord of Mantua in August 1328, with the title of captain-general, and afterwards of vicar-general of the empire, adding the designation of count of Mirandola and Concordia, which fief the Gonzagas held from 1328 to 1354. In July 1335 his son Guido, with the help of Filippino and Feltrino Gonzaga, wrested Reggio from the Scaligeri and held it until 1371. Luigi was succeeded by Guido (d. 1396); the latter's son Luigi II. came next in succession (d. 1395), and then Giovann Francesco I. (d. 1497), who, although at one time allied with the treacherous Gian Galeazzo Visconti, incurred the latter's enmity and all but lost his estates and his life in consequence; eventually he joined the Florentines and Bolognese, enemies of Visconti. He promoted commerce and wisely developed the prosperity of his dominions. His son Giov. Francesco II. (d. 1444) succeeded him under the regency of his uncle Carlo Malatesta and the protection of the Venetians. He became a famous general, and was rewarded for his services to the emperor Sigismund with the title of marques of Mantua for himself and his descendants (1432), an investiture which legitimized the usurpation of the house of Gonzaga. His son Luigi III. ("il Turco" (d. 1478) likewise became a celebrated soldier, and was also a learned and liberal prince, a patron of literature and the arts. His son Federigo I. (d. 1484) followed in his father's footsteps, and served under various foreign sovereigns, including Bona of Savoy and Lorenzo de' Medici; subsequently he upheld the rights of the house of
Este against Pope Sixtus IV, and the Venetians, whose ambitious
claims were a menace to his own dominions of Ferrara and Maranza.
His son Giovanni Francesco III (d. 1510) continued the
military traditions of the family, and commanded the allied
Italian forces against Charles VIII. at the battle of Forono;
he afterwards fought in the kingdom of Naples and in Tuscany,
until captured by the Venetians in 1509.
On his liberation he
adopted a more peaceful and conciliatory policy, and with the
help of his wife, the famous Isabella d'Este, he promoted the
fine arts and letters, collecting pictures, statues and other works
of art with intelligent discrimination. He was succeeded by his
son Federigo II. (d. 1540), captain-general of the papal forces.
After the death of the Emperor Maximilian, he declared for the
possessions of the house of Austria, married his daughter to
the emperor Charles V., raised his title to that of duke of Mantua in
1530; in 1536 the emperor decided the controversy for
the succession of Monferrato between Federigo and the house of
Savoy in favour of the former. His son Francesco I. succeeded
him, and, being a minor, was placed under the regency of his
uncle Cardinal Ercole; he was accidentally drowned in 1550,
leaving his possessions to his brother Guglielmo.
The latter was an extravagant spendthrift, but having subdued a revolt in Monferrato was presented with that territory by the emperor Maximilian, in consideration of his death in battle, at the siege of the town of Mussel in 1551.
His son Vincenzo I. (d. 1612), who was more addicted to amusements than to warfare. Then followed in succession his sons Francesco II. (d. 1612), Ferdinando (d. 1626), and Vincenzo II. (d. 1627), three incapable and dissolute princes. The last named appointed as his successor Charles, the son of Henriette, the heiress of the French family of Nevers-Rethel, who was only able to take possession of the ducal throne after a bloody struggle; his
dominions were laid waste by foreign invasions and he himself
was reduced to the sorest straits. He died in 1627, leaving his possessions to his grandson Charles (Carlos E.) under the regency
of the latter's mother Maria Gonzaga, which lasted until 1647.
Charles died in consequence of his own profligacy and was
succeeded by his son Ferdinando Charles (Ferdinando Carlo), who
was likewise for some years under the regency of his mother
Isabella of Austria. Ferdinando Charles, another extravagant
and dissolute prince, acquired the county of Guastalla by
marriage in 1678, but lost it soon afterwards; he involved his
country in useless warfare, with the result that in 1706 Austria
annexed the duchy. On the 5th of July of the same year he
died in Venice, and with him the Gonzagas of Mantua came to an
end.
Of the cadet branches of the house one received the lordship of
Bozolo, another the counties of Novellara and Bagnolo, a
third, of which the founder was Ferrante I. (d. 1557), retained
the county of Guastalla, raised to a duchy in 1621, and came to an
end with the death of Giuseppe Maria on the 16th of August
1746.

GONZAGA, THOMAZ ANTONIO (1744-1809), Portuguese
poet, was a native of Oporto and the son of a Brazilian-born
judge. He spent a part of his boyhood at Bahia, where his
father was disembarcador of the appeal court, and returning to
Portugal he went to the university of Coimbra and took his law
degree at the age of twenty-four. He remained on there for
some years and compiled a treatise of natural law on regalist lines,
dedicating it to Pombal, but the fall of the marquis led him to
leave Coimbra and become a candidate for a magistracy, and in
1782 he obtained the posts of ouvidor and proceder of the goods
and absent persons at Villa Rica in the province of Minas
Gerais in Brazil. In 1786 he was named disembarcador of the
appeal court at Bahia, and three years later, as he was about to
marry a young lady of position, D. Maria de Seixas Brandão, the
Maridio of his verses, he suddenly found himself arrested on the
charge of being the principal author of a Republican conspiracy in
Minas.
Conducted to Rio, he was imprisoned in a fortress and
interrogated, but constantly asserted his innocence. However,
his friendship with the conspirators compromised him in the eyes
of his absolutist judges, who, on the ground that he had known
of the projected revolt, were about to condemn him to perpetual
exile in Angola, with the confiscation of his property.
Later, this penalty was commuted into one of ten years of exile
to Mozambique, with a death sentence if he should return to America.
After having spent three years in prison, Gonzaga sailed in May
1792 for Mozambique and shortly after his arrival a violent fever
almost ended his life. A wealthy Portuguese gentleman, married
to a lady of colour, charitably received him into his house, and
when the poet recovered, he married his young daughter who
had nursed him through the attack. He lived in exile until
his death, when the Portuguese government exiled him to Brazil
in 1809-1811. He died at Bahia in 1812.
Leaving aside the sentimental and moral qualities of his verse,
his personal character is best described by the following epigram,
inscribed in his own handwriting in a copy of the "Lettre de
Parnasse" sent to him by his friends:
"Poëtes! qui préferez la gloire, ou la vertu?
Gonzaga, je préfère la vertu, et puis la gloire.
"Mon âme est noble, ma pensée est pure,
Mon cœur a rien de commun avec le sot.
"Mon âme est noble, ma pensée est pure,
Mon cœur a rien de commun avec le sot.
"Mon âme est noble, ma pensée est pure,
Mon cœur a rien de commun avec le sot.
"Mon âme est noble, ma pensée est pure,
Mon cœur a rien de commun avec le sot."
diocese of Calahorra. His name is to be met with in a number of documents between the years 1237 and 1246. He wrote upwards of 13,000 verses, all on devotional subjects. His best work is a life of St Oria; others treat of the life of St Millan, of St Dominic of Silos, of the Sacrifice of the Mass, the Martyrdom of St Laurence, the visible signs preceding the Last Judgment, the Praises of Our Lady, the Miracles of Our Lady and the Lamentations of the Virgin on the Passion of her Son. He writes in the common tongue, the roman paladin, and his claim to the name of poet rests on his use of the cuaderna via (single-rhymed quatrains, each verse being of fourteen syllables). Sometimes, however, he takes the more modest title of juglar (jongleur), when claiming payment for his poems. His literary attainments are not great, and he lacks imagination and animation of style, but he has a certain eloquence, in speaking of the Virgin and the saints a certain charm, while his verse bears at times the imprint of a passionate devotion, recalling the lyrical style of the great mystics. There is, however, a very strong popular element in his writings, which explains his long vogue. The great majority of his legends of the Virgin are obviously borrowed from the collection of a Frenchman, Gautier de Cointi; but he has succeeded in making this material entirely his own by reason of a certain consciousness and a realism in detail which make his work far superior to the tedious and colourless narrative of his model.

His Poesias are in the Biblioteca de autores españoles of Riva- deneyra, vol. viii. (1864); La Vida de San Domingo de Silos has been edited by J. D. Fritzgerald (Paris, 1901); see the Bibliothèque de l'Ecole des Hautes Études, part 143, on F. Gonzalez de Ramon; Madrid, 1860); N. Hergueta, "Documentos referentes a Gonzalo de Berceo," in the Revista de archivos, (3rd series, Feb.-March, 1904, pp. 178-179). (F. A.)

GOOCH, SIR DANIEL, Bart. (1816-1889), English mechanical engineer, was born at Bedlington, in Northumberland, on the 16th of August 1816. At the age of fifteen, having shown a taste for mechanics, he was engaged to work in the ironworks at Monmouthshire. In 1834 he went to Warrington, where, at the Vulcan foundry, under Robert Stephenson, he acquired the principles of locomotive design. Subsequently, after passing a year at Dundee, he was engaged by the Stephensons at their Gateshead works, where he seems to have conceived that predilec- tion for the broad gauge for which he was afterwards distinguished, through having to design some engines for a 6-foot gauge in Russia and noticing the advantages it offered in allowing greater space for the machinery, &c., as compared with the standard gauge favoured by Stephenson North. In 1837, on I. K. Brunel's recommendation, he was appointed locomotive superintendent to the Great Western railway at a time when the engines possessed by the railway were very poor and inefficient. He soon improved this state of affairs, and gradually provided his employers with locomotives which were unsurpassed for general excellence and economy of working. One of the most famous, the "Lord of the Isles," was a warded a gold medal at the Great Exhibition of 1851, and, when, thirty years afterwards, it was withdrawn from active service it had run more than three-quarters of a million miles, all with its original boiler. In 1864 he left the Great Western and interested himself in the problem of laying a telegraph cable across the Atlantic. At this time the "Great Eastern" was in the hands of the bondholders, of whom he himself was one of the most important, and it occurred to him that she might advan- tageously be utilized in the enterprise. Accordingly, at his instance she was chartered by the Telegraph Construction Company, of which also he was a director, and in 1865 was employed in the attempt to lay a cable, Gooch himself super- intending operations. The cable, however, broke in mid-ocean, and the attempt was a failure. Next year it was renewed with more success, for not only was a new cable safely put in place, but the older one was picked up and spliced, so that there were two complete lines between England and America. For this achieve- ment Gooch was created a baronet. Meanwhile the Great Western railway had fallen on evil days, being indeed on the verge of bankruptcy, when in 1866 the directors appealed to him to accept the chairmanship of the board and undertake the rehabilitation of the company. He agreed to the proposal, and was so successful in restoring its prosperity that in 1859, at the last meeting over which he presided, a dividend was declared at the rate of 7½%. Under his administration the system was greatly enlarged and consolidated by the absorption of various smaller lines, such as the Bristol and Exeter and the Cornish railways; and his appreciation of its strategic value caused him to be a strenuous supporter of the construction of the Severn Tunnel. His death occurred on the 15th of October 1889 at his residence, Clewer Park, near Windsor.

GOOD, JOHN MASON (1764-1827), English writer on medical, religious and classical subjects, was born on the 25th of May 1764 at Epping, Essex. After attending a school at Romsey kept by his father, the Rev. Peter Good, who was a Nonconformist minister, he was, at about the age of fifteen, apprenticed to a surgeon-apothecary at Gosport. In 1783 he went to London to prosecute his medical studies, and in the autumn of 1784 he began to practise as a surgeon at Sudbury in Suffolk. In 1793 he removed to London, where he entered into partnership with a surgeon and apothecary. But the partnership was soon dissolved, and to increase his income he began to devote attention to literary pursuits. Besides contributing both in prose and verse to the Analytical and Critical Reviews and the British and Monthly Magazines, and other periodicals, he wrote a large number of works relating to medical and religious subjects. In 1794 he became a member of the British Pharmaceutical Society, and in that connexion, and especially by the publication of his work, A History of Medicine (1795), he did much to effect a greatly needed reform in the profession of the apothecary. In 1820 he took the diploma of M.D. at Marischal College, Aberdeen. He died at Shepperton, Middlesex, on the 2nd of January 1827. Good was not only well versed in classical literature, but was acquainted with the principal European languages, and also with Persian, Arabic and Hebrew. His works were dedicated by himself; but their style is dull and tedious. His poetry never rises above pleasant and well-versed commonplace. His translation of Lucretius, The Nature of Things (1805-1807), contains elaborate philological and ex- planatory notes, together with parallel passages and quotations from European and Asiatic authors.

GOOD FRIDAY (probably "God's Friday"), the English name for the Friday before Easter, kept as the anniversary of the Crucifixion. In the Greek Church it has been or is known as πασχα [στουρύωμος], παρασκήνι, παρασκευή μεγάλη ή έγκ, στουότα αν τα σωστα, a name related to the verb σταφατεια, and among the Latins the names of most frequent occurrence are Paschae, Paschae, Dies Dominicae Passionis, Paracese, Feria Sexta Paschae, Feria Sexta Major in Hierusalem, Dies Absolutions. It was called Long Friday by the Anglo-Saxons 1 and Danes, possibly in allusion to the length of the services which marked the day. In Germany it is sometimes designated Stiller Freitag (compare Greek Εκσιδιαμα Δρακτος; Latin, hedomas inofficiosa, non laboriosa), but more commonly Chastrieg. The etymology of this last name has been much disputed, but there seems now to be little doubt that it is derived from the Old High German perch, meaning suffering or mourning.

The origin of the custom of a yearly commemoration of the Crucifixion is somewhat obscure. It may be regarded as that among Jewish Christians it almost imperceptibly grew out of the old habit of annually celebrating the Passover on the 14th of Nisan, and of observing the "days of unleavened bread" from the 1st to the 21st of that month. In the Gentile churches, on the other hand, it seems to be well established that originally no yearly cycle of festivals was known at all. (See EASTER.)

In its earliest observance, the day was marked by a specially rigorous fast, and also, on the whole, by a tendency to greater simplicity in the services of the church. Prior to the 4th century there is no evidence of non-celebration of the eucharist on Good Friday; but after that date the prohibition of communion

1 See Johnson's Collection of Ecclesiastical Laws (vol. i., anno 957): "Housel ought not to be hallowed on Long Friday, because Christ suffered for us on that day."
became common. In Spain, indeed, it became customary to close the churches altogether as a sign of mourning; but this practice was condemned by the council of Toledo (633). In the Roman Catholic Church the Good Friday ritual at Athens observed is marked by many special features, most of which can be traced back to a date at least prior to the close of the 8th century (see the Ordo Romanus in Muratori's Liturg. Rom. Vet.). The altar and officiating clergy are draped in black, this being the only day on which that colour is permitted. Instead of the epistle, sun-dry passages from Hosea, Habakkuk, Exodus and the Psalms are read. The gospel for the day consists of the history of the Passion as recorded by St John. This is often sung in plain-chaunt by three priests, one representing the "narrator," and another the various incidents of the passion, which singing of this is followed by bidding prayers for the peace and unity of the church, for the pope, the clergy, all ranks and conditions of men, the sovereign, for catechumens, the sick and afflicted, heretics and schismatics, Jews and heathen. Then follows the "adoration of the cross" (a ceremony derived from the church of Jerusalem and said to date back to near the time of Helena's "invention of the cross"); the hymns Pange lingua and Vexilla regis are sung, and then follows the "Mass of the Presanctified." The name is derived from the fact that it is celebrated with elements consecrated the day before, and sung, without theWinning of the chalice, the bread, and the wine, and is divided into three parts: prayer, adoration, and benediction. The first part of the Mass, which has been the subject of much discussion, is similar to the "ordo" of the sixth century, and was, in fact, in the ordinary of the various monastic orders, and the benediction of the wine, which is not, however, obligatory, is omitted in some places. The final part is the benediction of the consecrated elements which is given to all the faithful. The second part consists of the adoration of the cross, and the third of the benediction of the consecrated elements.

GOODRICH, SAMUEL GRISWOLD (1793-1860), American author, better known under the pseudonym of "Peter Parley," was born, the son of a Congregational minister, at Ridgefield, Connecticut, on the 16th of August 1793. He was largely self-educated, became an assistant in a country store at Danbury, Conn., in 1808, and at Hartford, Conn., in 1811, and from 1816 to 1822 was a bookseller and publisher at Hartford. He visited Europe in 1823-1824, and in 1826 removed to Boston, where he continued in the publishing business, and from 1828 to 1842 he published an illustrated annual, the Token, to which he was a frequent contributor both in prose and verse. A selection from these contributions was published in 1841 under the title Sketches from a Student's Window. The Token also contained some of the earliest works of N. P. Willis, Henry W. Longfellow and Lydia Maria Child. In 1847 he established Mary's Museum, which he continued to edit till 1854. In 1827 he began, under the name of "Peter Parley," his series of books for the young, which embraced geography, biography, history, science and miscellaneous tales. Of these he was the sole author of only a few, but in 1857 he wrote that he was "the author and editor of about 170 volumes," and that about seven millions had been sold. In 1857 he published Recollections of a Lifetime, which contains a list of both the works originally published and of the spurious works published under his name. By his writings and inventions he amassed a large fortune. He was chosen a member of the Massachusetts House of Representatives in 1836, and of the state Senate in 1837, his competitor in the last election being Alexander H. Everett, and in 1851-1853 he was consul at Paris, where he remained till 1855, taking advantage of his stay to have several of his works translated into French. After his return to America he published, in 1859, Illustrated History of the Animal Kingdom. He died, in New York, on the 9th of May 1860.

His brother, CHARLES AUGUSTUS GOODRICH (1790-1863), a Congregational clergyman, published various ephemeral books, and helped to compile some of the "Peter Parley" series.

GOODRICH, or GOODRICK, THOMAS (d. 1554), English ecclesiastic, was a son of Edward Goodrich of East Kirby, Lincolnshire, and was educated at Corpus Christi College, Cambridge, afterwards becoming a fellow of Jesus College in the same university. He was among the divines consulted about the legality of Henry VIII.'s marriage with Catherine of Aragon, became a royal chaplain about 1530, and was consecrated bishop of Ely in 1539. He was ordered to "Challenge the Act and Institution," helped in 1537 to draw up the Institution of a Christian Man (known as the Bishops' Book), and translated the Gospel of St John for the revised New Testament. On the accession of Edward VI. in 1547 the bishop was made a privy councillor, and took a conspicuous part in public affairs during the reign. "A busy secular spirited man," as Burnet calls him, he was equally opposed to the zealots of the "old" and the "new religion." He assisted to compile the First Prayer Book of Edward VI., was one of the commissioners for the trial of Bishop Gardiner, and in January 1551-1552 succeeded Rich as lord high chancellor. This office he continued to hold during the nine days' reign of "Queen Jane" (Lady Jane Grey); but he continued to make his peace with Queen Mary, confirmed to the restored religion, and, though deprived of the chancellorship, was allowed to keep his bishopric until his death on the 10th of May 1554.

See the Dict. Nat. Belg., where further authorities are cited.

GOODSIR, JOHN (1814-1867), Scottish anatomist, born at Anstruther (Fife), on the 20th of March 1814, was the son of John Goodsir, and grandson of Dr John Goodsir of Largo. He was educated at the burgh and grammar-schools of his native place and at the university of St Andrews. In 1830 he was apprenticed to a surgeon-dentist in Edinburgh, where he studied anatomy under Robert Knox, and in 1835 he joined his father in practice at Anstruther. Three years later he communicated to the British Association a paper on the pulp and sacs of the human teeth, his researches on the whole process of dentition.
GOODWILL—GOODWIN, T.

being at this time distinguished by their completeness; and about the same date, on the nomination of Edward Forbes, he was elected to the famous coterie called the "Universal Brotherhood of the Friends of Truth," which comprised artists, scholars, naturalists and others, whose relationship became a potent influence in directing him towards marine zoology, but from anatomy, pathology and morphology formed his chief study. In 1840 he moved to Edinburgh, where in the following year he was appointed conservator of the museum of the College of Surgeons, in succession to William Macgillivray. Much of his reputation rested on his knowledge of the anatomy of tissues. In his lectures in the theatre of the college in 1842-1843 he evidenced the largeness of his observation of cell-life, both physiologically and pathologically, insisting on the importance of the cell as a centre of nutrition, and pointing out that the organism is subdivided into a number of departments. R. Virchow recognized his indebtedness to these discoveries by dedicating his Cellular Pathologie to Gooddis, as "one of the earliest and most acute observers of cell-life." In 1843 Gooddis obtained the post of curator in the university of Edinburgh; the following year he was appointed demonstrator of anatomy, and in 1845 curator of the entire museum. A year later he was elected to the chair of anatomy in the university, and devoted all his energies to anatomical research and teaching.

Human myology was his strong point; no one had laboured harder at the dissecting-table; and he strongly emphasized the necessity of practice as a means of research. He believed that anatomy, physiology and pathology could never be properly advanced without daily consideration and treatment of disease. In 1848 he became a fellow of the Royal College of Surgeons, and in the same year he joined the Highland and Agricultural Society, acting as chairman of the veterinary department, and advising on strictly agricultural matters. In 1847 he delivered a series of systematic lectures on the comparative anatomy of the invertebrata; and, about this period, as member of an aesthetic society, he added to the latter domain his doctrine of beauty, the aesthetics of the ugly, of smell, the approbation or disapprobation of sounds, &c. Owing to the failing health of Professor Robert Jameson, Gooddis was induced to deliver the course of lectures on natural history during the summer of 1853.

The lectures were long remembered for their brilliancy, but the infinite amount of thought and exertion which they cost broke down the health of the lecturer. Gooddis, nevertheless, persevered in his labours, writing in 1855 on organic electricity, in 1856 on morphological subjects, and afterwards on the structure of organized forms. His speculations in the latter domain gave birth to his theory of a triangle as the mathematical figure upon which nature had built up both the organic and inorganic worlds, and he hoped to complete this triangle theory of formation and law as the greatest of his works. In his lectures on the skull and brain he held the doctrine that symmetry of brain had more to do with the higher faculties than bulk or form. He died at Wardie, near Edinburgh, on the 6th of March 1867, in the same cottage in which his friend Edward Forbes died. His anatomical lectures were remarkable for their solid basis of fact; and no one in Britain took so wide a field for survey or marshalled so many facts for anatomical tabulation and synthesis.

GOODWILL, in the law of property, a term of somewhat vague significance. It has been defined as every advantage which has been acquired in carrying on a business, whether connected with the premises in which the business has been carried on, or with the name of the firm by which it has been conducted (Churtten v. Douglas, 1850, Johns, 174). Goodwill may be either professional or trade. Professional goodwill usually takes the form of the recommendation by a retiring professional man, doctor, solicitor, &c., to his clients of the successor or purchaser coupled generally with an undertaking not to compete with him. Trade goodwill varies with the nature of the business with which it is connected, but there are two rights which, whatever the nature of the business may be, are invariably associated with it; viz., the right of the purchaser to represent himself as the owner of the business, and the right to restrain competition. For it is this right which gives value to goodwill of a business is property, and the proper duty must be paid on the conveyance of such. (See also PARTNERSHIP; PATENTS.)

GOODWIN, JOHN (c. 1594-1669), English Nonconformist divine, was born in Norfolk and educated at Queens' College, Cambridge, where he was elected fellow in 1617. He was vicar of St Stephen's, Coleman Street, London, from 1633 to 1645, when he was elected by parliament for his attacks on Presbyterianism, especially in his Omophax (1644). He thereupon established an independent congregation, and put his literary gifts at Oliver Cromwell's service. In 1649 he justified the proceedings of the army against the parliament ("Pride's Purge") in a pamphlet Might and Right Well Met, and in 1649 defended the proceedings against Charles I. (to whom he had offered spiritual advice) in T. Aerophilicus. At the Restoration this tract, with some that Milton had written to Monk in favour of a republic, was publicly burnt, and Goodwin was ordered into custody, though finally indemnified. He died in 1665. Among his other writings are Anti-Cavalierism (1642), a translation of the Strasigmata Satanae of Giacomo Aconcio, the Elizabethan advocate of toleration, tracts advocating a Fifth-Monarchy, his "Triumph" of Baptists, and Redemption Redeemed, containing a thorough discussion of... election, reprobation and the perseverance of the saints (1651, reprinted 1840). Goodwin's strongly Arminian tendencies brought him into conflict with Robert Baillie, professor of divinity of Glasgow, George Kendall, the Calvinist prebendary of Exeter, and John Owen (p.v.), who replied to Redemption Redeemed in The Doctrine of the Saints' Perseverance, paying a high tribute to his opponent's learning and controversial skill.

Goodwin answered all three in the Triumviri (1658). John Wesley in later days held him in much esteem and published an Abrupt Defence of... in 1774, and William Cobbett, in his Golden Fleece, a work on justification that had originally appeared in 1642.

Life by T. Jackson (London, 1839).

GOODWIN, NATHANIEL CARL (1857- ), American actor, was born in Boston on the 25th of July 1857. While clerk in a large shop he studied for the stage, and made his first appearance in 1873 in Boston in Stuart Robson's company as the newsboy in Joseph Bradford's Law. He made an immediate success by his imitations of popular actors. A hit in the burlesque Black-eyed Swan led to his taking part in Rice and Goodwin's Evangeline in the same year, and his success continued. It was as an转入 the domain..." (d. 1887), an English actress with whom he played in B. E. Woolf's Hobbies. It was not until 1889, however, that Nat Goodwin's talent as a comedian of the "legitimate" type began to be recognized. From that time he appeared in a number of plays designed to display his driely humorous method, such as Brander Matthews' and George H. Jessop's A Gold Mine, Henry Guy Carleton's A Gilded Fool and Ambition, Clyde Fitch's Nathan Hale, H. V. Esmond's When we were Twenty-one, &c. Till 1903 he was associated in his performances with his third wife, the actress Maxine Elliott (b. 1873), whom he married in 1898; this marriage was dissolved in 1908.

GOODWIN, THOMAS (1600-1680), English Nonconformist divine, was born at Rollesby, Norfolk, on the 5th of October 1600, and was educated at Christ's College, Cambridge, where in 1616 he graduated B.A. In 1619 he removed to Catharine Hall, where in 1620 he was elected fellow. In 1625 he was licensed a preacher of the university; and three years afterwards he became lecturer of Trinity Church, to the vicarage of which he was presented by the king in 1632. Worried by his bishop, who was zealous adherent of Laud, he resigned all his preferments and left the university in 1634. He lived for some time in London, where in 1638 he married the daughter of an alderman; but in the following year he withdrew to Holland, and for some time was pastor of a small congregation of English merchants and refugees at Arnhem. Returning to London soon after Laud's impeachment by the Long Parliament, he ministered for some years to the
GOODWIN, W. W.—GOODYEAR

Independent congregation meeting at Paved Alley Church, Lime Street, in the parish of St Dunstan's-in-the-East, and rapidly rose to considerable eminence as a preacher; in 1643 he was chosen a member of the Westminster Assembly, and at once identified himself with the Congregational party, generally referred to in contemporary documents as "the dissenting brethren." He frequently preached by appointment before the Commons, and in January 1650 his talents and learning were rewarded by the House with the presidency of Magdalene College, Oxford, a post which he held until the Restoration. He rose into high favour with the protector, and was one of his intimate advisers, attending him on his death-bed. He was also a commissioner for the inventory of the Westminster Assembly, 1650, and for the approbation of preachers, 1653, and together with John Owen (q.v.) drew up an amended Westminster Confession in 1675. From 1660 until his death on the 23rd of February 1680 he lived in London, and devoted himself exclusively to theological study and to the pastoral charge of the Fetter Lane Independent Church.

The works published by Goodwin during his lifetime consist chiefly of sermons printed by order of the House of Commons; but he was also associated with Philip Nye and others in the preparation of certain works. Of his collected works (1676), a posthumous edition, which include expositions of the Epistle to the Ephesians and of the Apocalypse, were published in five folio volumes between 1681 and 1704, and were reprinted in twelve 8vo volumes (Edin., 1866–1866). Characterized as "abundant yet unsolved reasoning, remarkable at once for the depth and for the narrowness of their observation and spiritual experience, often admirably thorough in their workmanship, yet in style emphatic and dry, both at home and abroad," they remedy the defects of the special school of religious thought to which they belong. Calamy's estimate of Goodwin's qualities may be quoted as both friendly and just. "He was a considerable scholar and an eminent divine, and had a very happy facility in descanting upon Scripture so as to bring forth surprising remarks, which yet generally tended to illustration." A memoir, derived from his own papers, by his son (Thomas Goodwin, "the younger," 1650–1710?), Independent minister at London and Pinner, and author of the History of the Reign of Henry V.), is prefixed to the fifth volume of his collected works; as a "patriarch and Atlas of Independentcy" he is also noticed by Mayhew (The Ancient and Modern History of the Church of England, 1844). An account of his life and works, from Addison's point of view, of the austere and somewhat fanatical president of Magdalene is preserved in No. 494 of the Spectator.

GOODWIN, WILLIAM WATSON (1831– ), American classical scholar, was born in Concord, Massachusetts, on the 9th of May 1831. He graduated at Harvard in 1851, studied in Germany, was tutor in Greek at Harvard in 1856–1860, and Eliot professor of Greek there from 1860 until his resignation in 1901. He became an overseer of Harvard in 1883. In 1852–1853 he was a member of the faculty of the American School of Studies at Athens. Goodwin edited the Panegyricus of Isocrates (1864) and Demosthenes On The Crown (1901); and assisted in preparing the seventh edition of Liddell and Scott's Greek–English Lexicon. He revised an English version by several writers of Plutarch's Morals (5 vols., 1871; 6th ed., 1880), and published the Greek text with literal English version of Aeschylus' Agamemnon (1906) for the Harvard production of that play in June 1906. As a teacher he did much to raise the tone of classical reading from that of a mechanical exercise to literary study. But his most important work was his Syntax of the Moods and Tenses of the Greek Verb (1860), of which the seventh revised edition appeared in 1877 and another (enlarged) in 1890. This was "based in part on Madvig and Krüger," but, besides making accessible to American students the works of these continental grammarians, it presented original matter, including a "radical innovation in the classification of conditional sentences," notably the "distinction between particular and general suppositions." Goodwin's Greek Grammar (elementary edition, 1870; enlarged 1879) was followed in 1855 by a second edition, and in 1884 a third edition, supervised by Goodwin, was published by American schools the Grammar of His Hereditary Language. Both the Moods and Tenses and the Grammar in later editions are largely dependent on the theories of Gildersleeve for additions and changes. Goodwin also wrote a few elaborate syntactical studies, to be found in Harvard Studies in Classical Philology, the twentieth volume of which was dedicated to him upon the completion of fifty years as an alumnus of Harvard and forty-one years as Eliot professor.

GOODWIN SANDS, a dangerous line of shoals at the entrance to the Strait of Dover from the North Sea, about 6 m. from the Kent coast of England, from which they are separated by the anchorage of the Downs. For this they form a shelter. They are partly exposed at low water, but the sands are shifting, and in spite of lights and bell-buoys the Goodwins wrongly predict the scene of wrecks, while attempts to erect a lighthouse or beacon have failed. Tradition finds in the Goodwins the remnant of an island called Lomea, which belonged to Earl Godwine in the first half of the 11th century, and was afterwards submerged, when the funds devoted to its protection were diverted to build the church steeple at Tenterden (q.v.). Four lightships mark the limits of the sands, and also signal by rockets to the lifeboat stations on the coast when any vessel is in distress on the sands. Perhaps the most terrible catastrophe recorded here was the wreck of thirteen ships of war during a great storm in November 1793.

GOODWOOD, a mansion in the parish of Boxgrove, in the Chichester parliamentary division of Sussex, England, 4 m. N.E. of Chichester. It was built from designs of Sir William Chambers with additions by Wyatt, after the purchase of the property by the first duke of Richmond in 1720. The park is in a hilly district, and is enriched with magnificent trees of many varieties, including some huge cedars. It is a building containing a Roman slab recording the construction of a temple to Minerva and Neptune at Chichester. There is mention of a British tributary prince named Cogidubnus, who perhaps served also as a Roman official. A reference to early Christianity in Britain has been erroneously read into this inscription. On the racecourse a famous annual meeting, dating from 1802, is held in July. The parish church of SS. Mary and Blaise, Boxgrove, is almost entirely a rich specimen of Early English work.

GOODYEAR, CHARLES (1800–1860), American inventor, was born at New Haven, Connecticut, on the 29th of December 1800, son of Aaron Goodyear (himself a maker of farm implements) and a pioneer in the manufacture of hardware in America. The family removed to Naugatuck, Conn., when Charles was a boy; he worked in his father's button factory and studied at home until 1816, when he apprenticed himself to a firm of hardware merchants in Philadelphia. In 1821 he returned to Connecticut and entered into a partnership with his father at Naugatuck, which continued till 1830, when it was terminated by business reverses. Already he was interested in an attempt to discover a method of treatment by which India-rubber could be made into merchandizable articles that would stand extremes of heat and cold. To the solution of this problem the next ten years of his life were devoted. With ceaseless energy and unwavering faith in the successful outcome of his labours, in the face of repeated failures and hampered by poverty, which several times led him to a debtor's prison, he persevered in his endeavours. For a time he seemed to have succeeded with a treatment (or "cure") of the rubber with aqua foris. In 1836 he secured a contract for the manufacture by this process of mail bags for the U.S. government, but the rubber fabric was useless at high temperatures. In 1837 he met and worked with Nathaniel Hayward (1808–1865), who had been an employee of a rubber factory in Roxbury and had made experiments with sulphur mixed with rubber. Goodyear bought from Hayward the right to use this imperfect process. In 1839, by dropping on a hot stove some indiarubber mixed with sulphur, he discovered accidentally the process for the vulcanization of rubber. Two years more passed before he could find any one who had faith enough in his discovery to invest money in it. At last, in 1844, by the help of an introduction, his first patent was granted, and in the subsequent years more than sixty patents were granted to him for the application of his original process to various uses. Numerous infringements had to be fought in the courts, the decisive victory coming in 1852 in the case of Goodyear v. Day, in which his rights were defended by Daniel Webster and opposed by Rufus Choate. In 1852 he went to England, where articles made under his patents had been displayed at the International Exhibition of 1851, but he
was unable to establish factories there. In France a company for the manufacture of vulcanized rubber by his process failed, and in December 1855 he was arrested and imprisoned for debt in Paris. Owing to the expense of the litigation in which he was engaged and to bad business management, he profited little from his inventions. He died in New York City on the 1st of July 1860. He wrote an account of his discovery entitled Gumm-Elastic and its Varieties (2 vols., New Haven, 1853-1855).

See also B. K. Peirce, Trials of an Inventor, Life and Discoveries of Charles Goodyear (New York, 1866); James Parton, Famous Americans of Recent Times (Boston, 1867); and Herbert L. Terry, India Rubber and its Manufacture (New York, 1897).

GOOGE, BARNABE (1540-1594), English poet, son of Robert Googe, recorder of Lincoln, was born on the 11th of June 1540 at Alvingham, Lincolnshire. He studied at Christ's College, Cambridge, and at New College, Oxford, where he did not choose to have taken a degree at either university. He afterwards removed to Staple Inn, and was attached to the household of his kinsman, Sir William Cecil. In 1563 he became a gentleman pensioner to Queen Elizabeth. He was absent in Spain when his poems were sent to the printer by a friend, L. Blundeston. Googe then gave his consent, and they appeared in 1563 as Eglog, Epitaphes, and Sonettes. There is extant a curious correspondence on the subject of his marriage with Mary Darrell, whose father refused Googe's suit on the ground that she was bound by a previous contract. The matter was decided by the intervention of Sir William Cecil, the bishop of Lincoln, and the marriage took place in 1564 or 1565. Googe was provost-marshall of the court of Connaught, and some twenty letters of his in this capacity are preserved in the record office. He died in February 1594. He was an ardent Protestant, and his poetry is coloured by his religious and political views. In the third "Eglog," for instance, he laments the decay of the old nobility and the rise of a new aristocracy of wealth, and he gives an indignant account of the sufferings of his co-religionists under Mary. The other eclogues deal with the sorrows of earthly love, looking up to a better world, in which the heavenly love is extolled. The volume includes epitaphs on Nicholas Grimald, John Bale and on Thomas Phaer, whose translation of Virgil Googe is uncritical enough to prefer to the versions of Surrey and of Gavin Douglas. A much more charming pastoral than any of those contained in this volume, "Phyllida was a lady maid" (Tottel's Miscellany) has been ascribed to Barnabe Googe. He was one of the earliest English pastoral poets, and the first who was inspired by Spanish romance, being considerably indebted to the Diana Enumorada of Montemayor. His other works include a translation from Marcellus Palingenius (said to be an anagram for Pietro Angelo Manzolini) of a satirical Latin poem, Zodiaicus vitae (Venice, 1531?), in twelve books, under the title of The Zoedyke of Life (1573); also The English Keene, or reign of Antichrist (1570), translated from Thomas Kirchmayer or Naegorius; The Spiritual Husbandrie from the same author, printed with the last; Foure Booke of Husbandrie (1577), collected by Corinna des Brassbachis; and The Proverbs of ..., Lopes de Mendosa (1579).

GOOLE, a market town and port in the Ogoscold cross-parliamentary division of the West Riding of Yorkshire, England, at the confluence of the Don and the Ouse, 24 m. W. by S. from Hull, served by the North Eastern, Lancashire & Yorkshire, Great Central and Asholme joint railways. Pop. of urban district (1901) 16,576. The town owes its existence to the construction of the Knottingley canal in 1836 by the Aire and Calder Navigation Company, after which, in 1839, Goole was made a bonding port. Previously it had been an obscure hamlet. The port was administratively combined with that of Hull in 1885. It is 47 m. from the North Sea (mouth of the Humber), and a wide system of inland navigation opens from it. There are eight docks supplied with timber ponders, quays, warehouses and other accommodation. The depth of water is 21 or 22 ft. at high water, spring tides. Chief exports are coal, stone, woolen goods and machinery; imports, butter, fruit, indigo, logwood, timber and wool. Industries include the manufacture of alum, sugar, rope and agricultural instruments, and iron-foundry. Shipbuilding is also carried on, and there is a large dry dock and a patent slip for repairing vessels. Passenger steamship services are worked in connexion with the Lancashire & Yorkshire railway to Amsterdam, Antwerp, Bruges, Copenhagen, Rotterdam and other north European ports. The handsome church of St John the Evangelist, with a lofty tower and spire, dates from 1844.

GOOSE (a common Teut. word, O. Eng. ges, pl. ges, Ger. Gans, O. Norse gad, from Aryan root, ghons, whence Sans. hamsa, Lat. anser (for hanger), Gr. γάτη, &c.), the genus Anseridae, introduced into Western Europe by the Romans and by the Normans, has been preserved by the family Anatidae of modern ornithologists, which are mostly larger than ducks and less than swans. Technically the word goose is reserved for the female, the male being called gander (A.-S. gandra).

The most important species of goose, and the type of the genus Anser, is undoubtedly that which is the origin of the well-known domestic race (see Poulter), the Anser ferox or A. cinerus of most naturalists, commonly called in English the grey or grey lag¹ goose, a bird of exceedingly wide range in the Old World, apparently breeding where suitable localities are in most European countries from Lapland to Spain and Bulgaria. Eastwards it extends to China, but does not seem to be known in Japan. It is the only species indigenous to the British Islands, and in former days bred abundantly in the English Fen-country, where the young were caught in large numbers and kept in a more or less reclaimed condition with the vast flocks of tame-bred geese that at one time formed so valuable a property to the dwellers in and around the Fens. It is impossible to determine when the wild grey lag goose ceased from breeding in England, but it certainly did so towards the end of the 18th century, for observations (Rural Sports iii. 287) of its having obtained two broods in one season. In Scotland this goose continues to breed sparingly in several parts of the Highlands and in certain of the Hebrides, the nests being generally placed in long heather, and the eggs seldom exceeding five or six in number. It is most likely the birds reared here that are from time to time obtained in England, for at the present day the grey lag goose, though once so numerous, is, and for many years has been, the rarest species of those that habitually resort to the British Islands. The domestication of this species, as Darwin remarks (Animals and Plants under Domestication, p. 187), is of very ancient date, and yet scarcely any other animal that has been tamed for so long a period, and bred so largely in captivity, has varied so little. It has increased greatly in size and fecundity, but almost the only change in plumage is that tame geese commonly lose the browner and darker tints of the wild bird, and are more or less marked with white—being often indeed wholly of that colour.¹ The most generally recognized breeds of domestic geese are those to which the distinctive names of Emden and Toulouse are applied; but a singular breed, said to have come from Sevastopol, was also introduced into Europe about the year 1856. In this the upper plumage is elongated, curled and spirally twisted, having their shaft transparent, and so thin that it often splits into fine filaments, which, remaining free for an inch or more, often coalesce again;² while the quills are abracted, so that the birds cannot fly.

¹ The meaning and derivation of this word lag had long been a puzzle until Skeat suggested (Ibis, 1870, p. 301) that it signified late, last, or slow, as in leggad, a loiterer, laggar, a laggard, or laglock, a clock that is behind. At the same time the suffix -lag in lagen, lagnions, lagenus, lagenii, lagenarum, lagenidium, &c., denoting posteriority of teeth (as the last to appear), and laglock, a clock that is behind time. Thus the grey lag goose is the grey goose which in England when the name was given was not migratory, but gregarious, and supposed to be a wild species at the time when they betook themselves to their northern breeding quarters. In connexion with this word, however, must be noticed the curious fact mentioned by Rowley (Orn. Miscell., iii. 213), that the feathers of tame geese in Lincolnshire are urged by their drivers with the cry of "lag-em, lag-em."² From the times of the Romans white geese have been held in great estimation, and, hence, though they seldom find their way into the practice of plucking geese alive, continued for so many centuries, has not improbably also helped to perpetuate this variation, for it is well known to many bird-keepers that a white feather is often produced in place of one of the natural colours that has been pulled out.

² In some English counties, especially Norfolk and Lincoln, it was no uncommon thing formerly for a man to keep a stock of a thousand goose, each of which might be reckoned to rear on an
The other British species of typical geese are the bean-geese (A. s. variegata), the pink-footed (A. brachyrhynchus) and the white-fronted (A. albifrons). On the continent of Europe, but not yet recognized as occurring in Britain, is a small form of the last (A. brachyrhynchus) which is known to breed in Lapland. All these, for the sake of discrimination, may be divided into two groups—

(1) those having the “nail” at the tip of the bill white, or of a very pale flesh colour, and (2) those in which this “nail” is black. To the former belong the grey lag goose, as well as A. albifrons and A. erythropus, and to the latter the other two.

A. albifrons and A. erythropus, which differ little but in size, the latter being not much bigger than a mallard (Anas boschas),—may be readily distinguished from the grey lag goose by their bright orange legs and their mouse-coloured upper wing-coverts, to say nothing of their very conspicuous white face and the broad black bars which cross the belly, though the last two characters are occasionally observable to some extent in the grey lag goose, which has the bill and legs flesh-coloured, and the upper wing-coverts of a bluish-grey. Of the second group, with the black “nail,” A. s. variegata has the bill long, black at the base and orange in the middle; the feet are also orange, and the upper wing-coverts mouse-coloured. In A. albifrons and A. erythropus, while A. brachyrhynchus has the bill short, bright pink in the middle, and the feet also pink, the upper wing-coverts being nearly of the same bluish-grey as in the grey lag goose. Eastern Asia possesses in A. gr. var. a third species of this group, which chiefly differs from A. s. variegata in its larger size. In North America there is only one species typical of goose, and that belongs to the white-“nail” group. It very nearly resembles A. albifrons, but is larger, and has been described as distinct under the name of A. gambeli. Central Asia and India possess in the bar-headed goose (A. indicus) a bird easily distinguished from any of the foregoing by the character implied by its English name; but it is certainly somewhat abnormal, and, indeed, under the name of Eulobis, has been separated from the genus Anser, which has no other member indigenous to the Indian Region, nor any at all to the Ethiopian, Australian or Neotropical Regions.

America possesses by far the greatest wealth of Anserine forms. Besides others, presently to be mentioned, its northern portions are the home of all the species of snow-geese belonging to the genus Chen. The first of these is C. hyperboreus, the snow-geese proper, a bird of large size, and when adult of a pure white, except the primaries, which are black. This has long been deemed a visitor to the Old World, and sometimes in considerable numbers, but the later discovery of a smaller form, C. albatus, scarcely differing except in size, throws some doubt on the older records, especially since examples which have been obtained in the British Islands undoubtedly belong to this lesser bird, and it would be satisfactory to have the occurrence in the Old World of the true C. hyperboreus placed on a surer footing. So nearly allied to the species last named as to have been often confounded with it, is the blue-winged goose, C. coeulescens, which is said never to attain a snowy plumage. Then we have a very small species, long ago described as distinct by Samuel Hearne, the Arctic traveller, but until 1861 discredited by ornithologists. Its distinctness has now been fully recognized, and it has received, somewhat unjustly, the name of C. rossi. Its face is adorned with numerous papillae, whence it has been removed by Elliot to a separate genus, Esonhemus, and for the same reason it has long been known to the European residents in the fur countries as the “horned wavey”—the last word being a rendering of a native name, Wave, which signifies goose. Finally, average seven goslings. The flocks were regularly taken to pasture and water, just as sheep are, and the man who tended them was called the gooseherd, corrupted into gossard. The birds were placed five times in the year, and in autumn the flocks were driven to London or other large markets. They travelled at the rate of about a mile an hour, and would get over nearly 10 m. in the day, for the reason the geese thrive better than the French. The ordinary spelling bernacle seems to be wrong, if we may judge by analogy with the French Bernache. In both words the e should be sounded as a.

The southern portions of the New World are inhabited by about half a dozen species of goose not nearly akin to the foregoing, and separated as the genus Chlorisphen. The most noticeable of them are the rock or kelp goose, C. antarctica, and the Canada goose, C. magellana (the only one of these which are really white and not grey). Formerly erroneously associated with the birds of this group comes one which belongs to the northern hemisphere, and is common to the Old World as well as to the New. It contains the geese which have received the common names of bernacle or brent, and the scientific appellations of Bernicla and Branta—for the use of either of which much may be said by nomenclaturists. All the species of this section are distinguished by their general dark sooty colour, relieved in some by white of greater or less purity, and by way of distinction from the members of the genus Anser, which are known as greys, being called by fowlers black goose. Of these, the best known both in Europe and North America is the brent-geese—the Anas bernicla of Linnaeus, and the B. torta of many modern writers—a truly marine bird, seldom (in Europe at least) quilling, salt-water, and coming southwards in vast flocks towards autumn, frequenting bays and estuaries on the British coasts, where it lives chiefly on sea-grass (Zostera marina). It is known to breed in Spitsbergen and in Greenland. A form which is by some ornithologists deemed a good species, and called by them B. nigricans, occurs chiefly on the Pacific coast of North America. In it the black of the neck, which in the common brent terminates just above the breast, extends over most of the lower parts. The true bernacle-geese, the B. leucopsis of most authors, is but a casual visitor to North America, but is said to breed in Iceland, and occasionally in Norway. Its usual incunabula, however, still form one of the puzzles of the ornithologist, and the difficulty is not lessened by the fact that it will breed freely in semi-captivity, while the brent-geese will not. From the latter the bernacle-geese is easily distinguished by its larger size and white cheeks. Hutchinson’s goose (B. Hutchinsii) seems to be its true representative in the New World. In this the face is dark, but a white crescentic or triangular patch extends from the throat on either side upwards behind the eye. Almost exactly similar in coloration to the last, but greatly superior in size, and possessing 18 rectrices, while all the foregoing have but 16, is the common wild goose of America, B. canadensis, which, for more than two centuries has been introduced into Europe, where it propagates so freely that it has been included by nearly all the ornithologists of this quarter of the globe as a member of its fauna. An allied form, by some deemed a species, is B. leucopareia, which ranges over the western part of North America, and, though having 18 rectrices, is distinguished by a white collar round the lower part of the neck. The most diverse species of this group of geese are the beautiful B. ruficolis, a native of north-eastern Asia, which occasionally strays to western Europe, and has been obtained more than once in Britain, and that which is peculiar to the Hawaiian archipelago, B. sandvicensis.

The largest living goose is that called the Chinese, Guiana or swan-geese, Cygnus cygnoides, and this is the stock whence the domestic geese of several eastern countries have sprung. It may often be seen in English parks, and it is found to cross readily with the common tame goose, the offspring being fertile,
and Blyth has said that these crosses are very abundant in India. The true home of the species is in eastern Siberia or Mongolia. It is distinguished by its long smooth neck, marked dorsally by a chocolate streak. The reclamed form is usually distinguished by the knob at the base of the bill, but the evidence of many old specimens shows that this has been changed in the wild race. Of this bird there is a perfectly white breed.

We next have to mention a very curious form, Cercopis nonae-kolllandiae, which is peculiar to Australia, and is a more terrestrial type of goose than any other now existing. Its short, decurved bill and green cere give it a very peculiar expression, and its almost uniform grey plumage, bearing rounded black spots, is also remarkable. It bears captivity well, breeding in confinement, but is now seldom seen. It appears to have been formerly very abundant in many parts of Australia, from which it has of late been exterminated. Some of its peculiarities seem to have been still more exaggerated in a bird that is wholly extinct, the Cnemorhizus calcitrans of New Zealand, the remains of which were described in full by Sir R. Owen in 1873 (Trans. Zool. Society, ix. 253). Among the first portions of this singular bird that were found were the tibiae, presenting an extraordinary development of the patella, which, united with the shank-bone, gave rise to the generic name applied. For some time the affinities of the owner of this wonderful structure was in doubt, but all hesitation was dispelled by the discovery of a nearly perfect skeleton, now in the British Museum, which proved the bird to be a goose, of great size, and unable, from the shortsness of its wings, to fly. In correlation with this loss of power may also be noted the dwindling of the keel of the sternum. Generally, however, its osteological characters point to an affinity to Cercopis, as was noticed by Dr Hector (Trans. New Zool. Institute, vi. 76-84), who first determined its Anserine character.

Birds of the genera Cheleapex (the Egyptian and Orinoco geese), Plectropterus, Sarcosornis, Clamydopterus, and some others, are commonly called geese. It seems uncertain whether they should be grouped with the Anserinae. The males of all, like those of the above-mentioned genus Chloephaga, appear to have that curious enlargement at the junction of the bronchial tubes and the trachea which is so characteristic of the ducks or Anatinae. (A. N.)

**GOOSE (GAME OF)**—**GOOSEBERRY**

GOOSE, Ribes grossularia, a well-known fruit-bush of northern and central Europe, placed in the same genus of the natural order to which it gives name (Rbisaceae) as the closely allied currants. It forms a distinct section Grossularia, the members of which differ from the true currents chiefly in their spiny stems, and in their flowers growing in foot-stalks, solitary, or two or three together, instead of in racemes. The wild gooseberry is a small, straggling bush, nearly resembling the cultivated plant,—the branches being thickly set with sharp spines, standing out singly or in diverging tufts of two or three from the bases of the short spurs or lateral leaf shoots, on which the bell-shaped flowers are produced, singly or in pairs, from the groups of rounded, deeply-crenated 3- or 5-lobed leaves. The fruit is smaller than in the garden kinds, but is often of good flavour; it is generally hairy, but in one variety smooth, constituting the R. Uva-crispa of writers; the colour is usually green, but plants are occasionally met with having deep purple berries. The gooseberry is indigenous in Europe and western Asia, growing interminably in grassy places and rocky woods in the lower country, from France eastward, perhaps as far as the Himalaya. In Britain it is often found in copses and hedgerows and about old ruins, but has been so long a plant of cultivation that it is difficult to decide upon its claim to a place in the native flora of the island. Common as it is now on some of the lower slopes of the Alps of Piedmont and Savoy, it is uncertain whether the Romans were acquainted with the gooseberry, though it may possibly be alluded to in a vague passage of Pliny: the hot summers of Italy, in ancient times as at present, would be unfavourable to its cultivation. Absurdly enough, in Germany and France, it does not appear to have been much grown there in the middle ages, though the wild fruit was held in some esteem medicinally for the cooling properties of its acid juice in fevers; while the old English name, *Fea-berry,* still surviving in some provincial dialects, indicates that it was similarly valued in Britain, where it was planted in gardens at a comparatively early period. William Turner describes the gooseberry in his *Herbal,* written about the middle of the 16th century, and a few years later it is mentioned in the *Travels in Transylvania* of Thomas Turner as an ornamental object of garden culture. Improved varieties were probably first raised by the skilful gardeners of Holland, whose name for the fruit, *Kruisbeet,* may have been easily corrupted into the present English vernacular word. Towards the end of the 18th century the gooseberry became a favourite object of cottage-horticulture, especially in Lancashire, where the working cotton-spinners have raised numerous varieties from seed, their efforts having been chiefly directed to increasing the size of the fruit. Of the many hundred sorts enumerated in recent horticultural works, few perhaps equal in flavour some of the older specimens of the fruit-garden, such as the "old rough red" and "hairly amber." The climate of the British Islands seems particularly adapted to bring the gooseberry to perfection, and it may be grown successfully even in the most northern parts of Scotland; indeed, the flavour of the fruit is said to improve with increasing latitude. In Norway even, the bush flourishes in gardens on the west coast nearly up to the Arctic circle, and it is found wild as far north as 63°. The dry summers of the French and German plains are less favourable to the growth of the fruit, but they have been most tolerable success. The gooseberry in the south of England will grow well in cool situations, and may be sometimes seen in gardens near London flourishing under the partial shade of apple trees; but in the north it needs full exposure to the sun to bring the fruit to perfection. It will succeed in almost any soil, but prefers a rich loam or black alluvium, and, though naturally a plant of rather dry places, will do well in moist land, if drained.

The varieties are most easily propagated by cuttings planted in the autumn, which root rapidly, and in a few years form good fruit-bearing bushes. Much difference of opinion prevails regarding the mode of pruning this valuable shrub; it is probable that in different situations it may require varying treatment. The fruit being borne on the lateral spurs, and on the shoots of the last year, it is the usual practice to shorten the side branches in the winter, before the buds begin to expand; some reduce the longer leading shoots at the same time, while others prefer to nip off the ends of these in the summer while they are still young.
